THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York. British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London, W. C. 1, England.

MINNEAPOLIS HAS ELECTED a Labor Mayor, William A. Anderson, who has been chairman of the Farmer-Labor State Central Committee and in former years was closely associated with A. C. Townley of Farmer-Labor fame. Denounced as a dangerous radical and personally much abused, Mr. Anderson defeated George E. Leach, who has served four times as Mayor of Minneapolis and became a brigadier general in the World War, carrying the election by the largest majority in the city's history, by about 28,000 votes. Mr. Anderson made no apologies for his affiliation with what the Minneapolis *Tribune* called "the most radical movement this section of the country has ever known," and he did not pretend that he had in the remotest degree changed his opinions. Indubitably the popular antagonism to the Hoover Administration counted, for it was a clear-cut struggle between the Republican and the Farmer-Labor candidates, but there was also a strong desire for a new political deal. Coming on top of the election of Floyd Olson as Farmer-Labor Governor, it affords ground for hope that here may be a beginning of the new third-party movement. At any rate Mr. Anderson's administration will bear watching by all liberals and progressives.

THE FRENCH CHAMBER OF DEPUTIES has set an example to parliaments everywhere by refusing to vote the 23,000-ton battleship which the Minister of Marine demanded as an offset to the new 10,000-ton German vessel.

For once legislators have refused to be led by the nose by their government and the so-called naval experts. Would that our Congress might profit by the example! It was admirably pointed out in the debate that if France built a 23,000-ton battleship, Italy would build one of 35,000 tons, and that there would be no end to the thing; also it was insisted that it was preposterous to vote this ship when Europe is on the verge of a disarmament conference which will take place before the keel of the ship could be laid. This, and the tremendous popular acclaim given to Briand's pacifist speech at Gourdon, give us further reason to believe that the French people are not so frightened about their security as the politicians would have us believe. On the contrary, we still feel that if there is any real anxiety among the French people about their safety, it is because they have been whipped into it by their conscienceless politicians for the sake of politics and personal preferment.

DOMINION STATUS FOR INDIA with all the rights and privileges of other British dominions, including the right to secede from the empire, is the ultimate aim of the scheme of government which is reported to have been worked out tentatively by Lord Irwin and Mahatma Gandhi during their conference at Delhi. According to the London correspondent of the New York *Herald Tribune*, who claims to have received the information from reliable Indian sources, the viceroy will enjoy, during the transitional period before dominion status is attained, a measure of authority not greatly different from that which he has at present; but the limit of the transitional period is to be definitely fixed, and thereafter the viceroy, instead of being appointed independently by the Crown, will be designated on the recommendation of the premier of the Indian federal government and may be an Indian. The executive authority of the new government will be vested in a cabinet representing the princes and the majority party or party coalition in the two houses of the legislature. The legislature will be representative in each of its two branches of the Indian states and British India, the members from the states being partly elected and partly appointed, and minorities are to be insured representation if joint electoral action proves impracticable. The provincial governments are to be both responsible and autonomous. The financial arrangements, which include a reserve bank, appear to contemplate complete self-support for India, and the army will pass eventually under Indian control. These seem in the main most admirable and far-reaching proposals.

WHERE IS THE PROSPERITY Senator Jim Watson promised us a year ago, or the upswing in the stock market that Reed Smoot said was surely coming, or the return of confidence and certainty to the business world that Herbert Hoover looked upon as inevitable? These are some of the fruits which twelve months ago we were assured would come to us with the enactment of the Hawley-Smoot tariff law. Said Jim Watson to the Senate: "If this bill is passed, this nation will be on the upgrade financially, eco-

nominically, and commercially within thirty days, and within a year from this date we shall have regained the peak of prosperity." After the bill had passed, Senator Smoot declared that now "the stock market of course will recover." In announcing that he would sign the bill, Herbert Hoover said: "It is urgent that the uncertainties in the business world, which have been added to by the long-extended debate, should be ended. They can be ended only by completion of this bill." Mr. Hoover signed the bill on June 17 a year ago. Plenty of time has since elapsed to determine the truth of these prophecies. What about it, gentlemen; have the gods played you false, or were you merely talking nonsense to cover up what, as many intelligent persons knew then and as almost everybody knows now, was the most outrageous tariff robbery in American history?

THE INEVITABLE OVERTHROW of the bourbon protectionism embodied in the Smoot-Hawley measure, of which there are multiplying signs today, is likely to be brought about by the active agency of the great export industries, which find their ability to sell abroad lessened by the inability of foreigners to sell in our markets. James D. Mooney, vice-president of the General Motors Corporation, and Allan C. Reiley, former advertising manager of the Remington Typewriter Company, in their new book "Onward Industry" declare truly that "the old traditional policy has ceased to protect and has begun to destroy." As the authors state, self-reliant American industries are asking nothing except to be relieved of legislative policies that cripple their expansion. Could there be a better time than the present to strike out for lower tariffs, with the consequent stimulus to world trade and industry?

THE GRAVITY OF THE DEPRESSION in ocean trade can now well be measured by its effects upon the Atlantic steamship lines. The French Line, for example, with thirty-eight of its steamers laid up for lack of cargo and passengers, has had to turn to the French government for aid to the extent of no less than \$12,000,000, in order to carry on longer and to complete the superliner which it is building for the New York route. The French Premier promptly responded by urging upon the Chamber of Deputies the granting of this entire amount in one form or another. Equally serious is the announcement that the United States Lines, which operate the Leviathan and ten other ships, are ready to abandon their project and may propose to the government to take back the ships, upon which they have already made substantial payments, with a view to reverting to their previous status of lessees of these vessels. Not in the memory of shipping men has it ever come to pass before at this time of year that some of the largest and most popular vessels have been withdrawn for a couple of voyages because of lack of traffic. Those that are continuing their sailings are, with the exception of the Europa and Bremen of the North German Lloyd, leaving with astonishingly small passenger lists.

SIR ARTHUR JAMES SALTER, former director of the economic section of the League of Nations, in his recent address before the Bond Club of New York gave an admirable example of the spirit in which important economic questions ought to be considered. He pointed out to

the assembled financiers that the later development of our competitive, individualistic capitalist system has brought out with increasing clearness both its merits and its defects—the former consisting essentially in its stimulus to productive activity, the latter in its inability to utilize its capacity regularly and to distribute the results justly. If we are not to have chaos, then, we are faced with a choice, he declared, between collective leadership by industry and finance on the one hand and collective control by the state on the other. Hence he urged upon his audience the necessity for consultation in order that they might help furnish the leadership the world will need in their field, particularly in the way of checking mad speculation and undesirable government loans. Capitalism plainly cannot vindicate and maintain itself except by the exercise of collective responsibility on the part of its leaders, as Sir Arthur Salter suggests. Why can we in this country not have a larger measure of such thoughtful and reasoned consideration of the actual problems of our present position, with an attempt to find practicable solutions, instead of the passionate and unreasoning defense of things as they are that marks the utterances of our President and other public men of the same type?

SOMETHING APPEARS to have gone radically wrong in the Department of Commerce, the branch of the government toward which American business has long looked for reliable information on the economic situation. Dr. Ray Hall, one of the most dependable economists in the department, has resigned his post, according to a Washington dispatch, "rather than obey orders to juggle figures so as to show the nation-wide depression less appalling than it is." On the other hand, Dr. Hall's superiors contend that this was not the case at all. They deny that there was any attempt at juggling figures, and say, first, that Dr. Hall refused to submit to discipline in the handling of his work, and, second, that the resignation was due solely to a difference of opinion. The public has not yet been given the actual facts, so at the moment there is no way of judging the truth of the situation. But even granting that the explanation offered by Dr. Hall's superiors is substantially correct, one must wonder why it was found necessary to discipline him. This sounds suspiciously as though he had been given orders of a kind which he as a trained economist could not accept. In any event, the incident has thrown considerable doubt on the reliability of the department's business and economic information.

DEPRESSION IN REAL ESTATE has, of course, gone along with depression in business generally, and a recent report of the Real Estate Securities Committee of the Investment Bankers' Association may lead a good many investors to conclude that a collapse in realty bonds will have to occur before the country's business turns the corner. Of an estimated volume of \$10,000,000,000 of real-estate bonds outstanding, the committee adjudges that \$4,000,000,000 have "good standing" or are likely to "work out without foreclosure or loss," \$2,500,000,000 may be expected to undergo foreclosure or work out with losses of from 10 to 25 per cent, \$3,000,000,000 may suffer losses ranging from 25 to 26 per cent, and \$500,000,000 represent unwise investments which may have to meet losses of from 60 to 100 per cent. Actually, the report is not so gloomy as it seems. To

have 40 per cent of a ten-billion-dollar investment reckoned as sound or reasonably safe from loss, and another 15 per cent threatened with possible loss of only 10 to 25 per cent, seems a tolerably good showing for these troubled times. If stock-market prices are a fair indication of the present worth and future prospects of the industries which listed securities represent, the depression in real estate is no greater than the depression in industry and business in most other lines.

ONLY ONE of Mr. Hoover's Western speeches pleased his supporters and the party organs—his address to the Indiana editors. It had an unusual crispness, a drive, and a vigor which may be attributed to the fact that he has recently changed his literary secretary. It was, moreover, a partisan outburst marked by effrontery and stubborn adherence to the tariff and other party idols, so that it went well with the party hacks. The rest of his utterances pleased but little. His remarks about Lincoln were dull and banal. The speech at Harding's tomb contained a most damaging admission—that "Harding had a dim realization that he had been betrayed by a few men whom he trusted, by men whom he believed to be his friends." That is certainly damning. If President Harding had a "dim realization" only of his betrayal by Fall and others, why did he not obtain a clear realization? A few questions asked of newspapermen and others in Washington would have enlightened him fully. As Senator Walsh of Montana was quick to ask, why did not President Harding peremptorily dismiss these false friends at the very first intimation? And as for Mr. Hoover himself, why was this superman silent in the Cabinet? Why did not Mr. Hoover insist on Mr. Harding's doing something at once, or else do what every high-minded gentleman usually does under such circumstances—resign his own position and refuse to associate with crooks? We decline to accept the other alternative that so clever a man as Mr. Hoover was ignorant of the facts, especially after the speech of the senior Senator La Follette in which he thoroughly outlined the Teapot Dome scandals. And what is true of President Hoover in this connection is equally so of Charles E. Hughes, then Secretary of State.

WHEN MR. HOOVER or one of his appointees plays politics he is performing a "great service" for the country. When someone else sincerely tries to do the people a real service, his action forthwith becomes politics of an especially vicious sort. Thus reasoned Mr. Hoover in his Indianapolis speech. He said of the Wagner employment-exchange bill, which he vetoed: "I have refused to accept such schemes, as they would in many places endow political organizations with the gigantic patronage of workmen's jobs. That would bring about the most vicious tyranny ever set up in the United States. We have instead expanded our federal-government agencies, which are on a non-political basis. They are of far greater service to labor." It so happens, however, that a sober and responsible organization, the American Association for Labor Legislation, had troubled to look into the manner in which the federal agencies were being expanded under the careful guidance of Secretary of Labor Doak. It was found that at least fifteen of the newly appointed directors of the federal service were "members of the railroad unions with which Mr. Doak was closely connected for many years," and it was also

learned that "several others who were given jobs in the 'reorganized service' are 'lame-duck' State office-holders whose fortunes were adversely affected by the political upheavals of recent State elections." The report quoted "one experienced State official" as saying: "It appears that Secretary Doak is persistent to set up his own political organization under the guise of an employment service." Rather amusing, then, is it not, to hear from Mr. Hoover that the federal service is on "a non-political basis"?

INDUSTRIAL WARFARE of the bitterest sort, with all that that means in the way of oppression and unrest, starvation and disease, today grips almost the whole of the soft-coal mining country. Using the only weapon at their command to fight the slashing of wages, which already were pitifully low, the miners have gone out on strike in many places. Bloody battles with company police and State militia have often followed. The strikers have not the financial means with which to carry on. They have not even enough money to keep their families from starvation and pestilence. Funds must be had at once to save thousands of families. A. J. Muste, head of Brookwood Labor College, has telegraphed from Charleston, West Virginia, the following appeal to *The Nation* for assistance:

Am touring mine regions. Few thousand dollars in next ten days may make all difference here in West Virginia between union settlement and positive betterment or continuance of condition of harrowing starvation, disease, and heartless oppression in tense situation swiftly coming to head. Please rush aid here to Tom Tippet, Old Kanawha Valley Bank Building.

NEWS OF THE MISERABLE PLIGHT of our jobless millions reacts differently upon different people. It moves the President every other week or so to tell these hungry workers and their dependents that they must not look to their government for help. It turns our wealthy business men and bankers to brooding over the possibility of revolution and to making bewildering and misleading promises of prosperity about to revive. In Africa the news has inspired a small group of natives, themselves immersed in poverty, to offer out of their meager resources the sum of \$3.77 to help the "starving in America," about whom they had been reading in their newspapers. "As actual money this sum is small," wrote Dr. Albert I. Good, missionary in Cameroon, Africa, to the Board of Foreign Missions of the Presbyterian church, "but as you well know the conditions out here and what such a sum of money means here, the gift is really large." This ought to melt a heart even of Hooverian hardness, but it probably won't. The day after it published this African contribution, the *New York Times*, through its Washington correspondent, described Mr. Hoover as being "in a very pleasant state of mind over the economic outlook." He was said to be particularly pleased with "a report covering the whole country which indicated that not a single bread line was now being maintained." So the situation is not nearly so bad as the facts available had led us, and the natives of Cameroon, to believe. Perhaps we had better suggest to the Board of Foreign Missions that it return the \$3.77 to the donors, who were guileless enough to believe—like most Americans—that upwards of six million people in this country are unemployed.

President Hoover's Great Action

WE believe that it is impossible to overestimate the world-wide importance of President Hoover's announcement on June 19 that he was conferring with the leaders of both political parties with a view to helping the world situation and especially Germany. Followed up the next day by his proposal for a year's postponement "of all payments on intergovernmental debts, reparations, and relief debts, both principal and interest, of course not including obligations of governments held by private parties," it probably constitutes the most far-reaching and the most praiseworthy step taken by any American President since the treaty of peace. In our issue of June 10 we declared that "no greater opportunity has ever come to an American President, save only Mr. Wilson, to lead the world and render it an incalculable service" than that which was facing Mr. Hoover, but which he seemed then to be entirely unwilling to grasp. Now he has grasped it, and the very first results have been what we prophesied they would be. "The mere announcement," we said in the same editorial, "that he had begun to busy himself with international affairs, with a view to cooperation and aid, would send a thrill of hope and encouragement all around the world." Two days after Mr. Hoover's move the *New York Times* was able to report that hearty approval of the President's proposal "was expressed in many parts of the world yesterday, ranging from Europe to South America and as far as China."

So the United States has gone back into European affairs. This time, not as in 1917 to make the European situation worse and to postpone for a year and a half the arrival of peace, but for the pacific and constructive purpose of taking the direct road toward the restoration of normal conditions abroad. Let it be admitted that it is but a beginning, a breathing spell, a palliative, a further putting off of the day when the whole reparations problem must be studied anew. None the less, it is of enormous importance because it is at last an expression of American willingness to lead; it is a concrete proposal for help, the vast psychological effects of which alone comparatively few Americans will be able either to gauge or to understand. More than that, it is the first time that Mr. Hoover has been willing to speak of reparations and debts in the same breath. Until now he has steadfastly maintained that they were entirely separate and not to be considered together. True, he has again restated his belief that "reparations is necessarily wholly a European problem with which we have no relation." But he has proposed in the same sentence the suspension of payments for reparations and debts and thereby admitted their correlation, their interdependence, his own inability to deal with one without the other. What will happen at the end of the year of suspension is anybody's guess. For the moment that is immaterial. We would not conceal our belief that the moratorium thus granted will be further continued; we have never from the beginning believed that the reparations would ever be paid, or the moneys owed to us either. This brave and admirable beginning of President Hoover should lead inevitably to a new conference to revise thoroughly the Young Plan and to fit it to existing conditions, or the con-

ditions that may be existing a year hence. It never was a definitive settlement and it never could be.

That this proposal for a postponement of payments for twelve months does not go to the root of the difficulties which are undermining Europe and bringing more than one government to the verge of the abyss is perfectly obvious. The wicked treaty of peace with its impossible map of Europe, the tariff barriers, the fear and hatred of one country for another, the armaments which are leading directly to war as well as to bankruptcy—all these and other handicaps must be removed before Europe can be regarded as safe. But the point is that a great forward step has been taken in the uttermost good-will and in complete frankness. Through Mr. Hoover's action the United States again takes the moral leadership of the world. For once it is approaching the nations abroad in the true spirit of friendship and brotherliness, in that spirit of helpfulness and readiness to aid even at a personal sacrifice which we believe to be characteristic of the attitude of the American people in foreign affairs when their wishes and desires are not misconstrued and misrepresented by men in office in Washington. On the other side of the ocean it is a changed Europe with which we have to deal today just as a result of the few words penned by Mr. Hoover. There is not today a business man, a liberal reformer, a patriot, or a statesman anywhere who has not been heartened by what has happened over the week-end. Even if France should refuse to allow postponement of the payment of \$100,000,000 for reconstruction, which is earmarked as non-postponable even in the Young Plan proviso as to a moratorium, the net result will still be a tremendous gain. Germany had expected to pay that right along. It should not have to do so for the next twelve months, but if it needs must it can undoubtedly do so. As for France, however, though the outcome is uncertain at this writing, we do not for a moment believe that it will dare to take a position contrary to that favored by every other country in Europe and by ourselves. But if her leaders should wish to play the dog in the manger, the sooner the better.

Perhaps the best thing about the Hoover action is that it came unexpectedly and of his own initiative, that he did not wait until absolutely compelled to move by the complete collapse of Germany or by a despairing round-robin from a group of European states. He was wise, too, in again coupling his action with the question of disarmament to the extent of asking that our move be considered a definite contribution to that spirit of international good-will which will alone make possible the success of the disarmament conference. Neither the government, Mr. Hoover, nor the American people will demand gratitude for their acts. But it would be the stupidest and most churlish ingratitude on the part of Europe, and especially on the part of the French, if the disarmament conference should not now be carried to a triumphant success. Time will show as to that. We would only repeat our belief that we may yet date the rescuing of the world from its present economic chaos from the day of Mr. Hoover's message. Both as Americans and as citizens of the world we express to him our unqualified gratitude.

The Railroads at Bay

THE petition of the railroads for a 15 per cent blanket increase of freight rates is an impressive document. From the standpoint of the present law the request for an increase of revenues, and presumably of rates, is unanswerable, for the ability of the roads to provide the adequate and efficient service required by law is unquestionably threatened by the inadequacy of present and prospective earnings and the consequent probable financial difficulties. When the depression began, the executives, responding to the President's request, pursued a policy of maintaining normal expenditures "as long as it could be justified from the standpoint of the trust reposed by the railroad security-holders in the managements of the carriers, who were administering property which, though devoted to public use, is nevertheless private property"—a statement which suggests the root of the present difficulty. As the depression continued they undertook drastic economies, cutting maintenance expenditures far below the point of full maintenance. Even so, the return on railroad property reached only 3.54 per cent in 1930, and during the first four months of 1931 it was at the rate of but 2.24 per cent a year. The value of railroad securities has already been disastrously affected, and unless railroad finances can be improved, results of the gravest character threaten not only the roads themselves, but the savings banks, the life-insurance companies, and all the host of fiduciary and other institutions that have bought railroad securities because they were absolutely gilt-edged investments.

Further economies, the roads contend, are impossible except by slashing wages, a course of doubtful economic and political wisdom, and impossible, under the law, of prompt accomplishment. Hence relief, under that law, must come through added revenues. But passenger fares, at 3.6 cents per mile, are already at the upper limit, with the automobile cutting disastrously and permanently into passenger traffic. Therefore the roads ask the quick and direct relief of a 15 per cent increase of freight rates in order to save themselves and railroad investors from financial disaster. Even this increase, they contend, would bring a return of less than 4 per cent on their investment. As they are not allowed to earn high returns during times of prosperity, they cannot be expected to bear the full weight of adversity; otherwise investors will not put their money into railroads. The argument appears to us unanswerable from the standpoint of the existing law, yet we are entirely opposed to the proposed increase.

Under the law the commission must fix rates so as to yield, if possible, a "fair return" (fixed at the moderate figure of $5\frac{3}{4}$ per cent) on the value of property used in transportation. Accordingly, the roads are clearly entitled to the increase of rates requested, provided we assume that such rates will substantially increase revenues. Unfortunately, some of the executives themselves are doubtful whether a chief result may not be the further diversion of traffic to those deadly competitors, the motor trucks, and consequently little increase of railroad revenues. But assuming that no such result occurred, and that the railroads gained, might it not be economically disastrous, in a time of profound business depression, to lay on prostrate farmers, on manufacturers unable to sell goods for enough to cover the cost of

production, or on the customers of both, the burden of a 15 per cent increase of freight rates? Such action would appear to us extremely unwise. The political results, not to speak of the economic consequences, might well prove fatal to our whole existing scheme of railroad control. For a decade railroad executives, necessarily pursuing the interests of their stockholders, have held up the processes of consolidation contemplated by law and required in the interest of economy and efficiency. As a result of the competition enjoined on them by law, they are today running numerous expensive and unnecessary passenger trains that are distinctly uneconomical. In the public view and in their own view, as illustrated by the above examples, their roads are private profit-making enterprises; yet they ask the public (and properly under the law) to tax itself at a time of severe business depression for the benefit of their investors and stockholders. The Transportation Act of 1920 worked fairly well under conditions of prosperity (though the roads received \$2,579,000,000 less than a "fair return" between 1921 and 1930), and the railroads acquitted themselves handsomely. Depression brings out the fundamental logical contradiction of the act, with its attempt to assure "fair return" on private property.

What then? We hope to see an irresistible movement for government ownership of the roads brought about by railroad security-owners themselves in order to avert financial disaster. We should heartily welcome such a movement, for it would give to the American people and their government the first opportunity they have ever had for developing a transportation system without having at the same time to overcome the obstacles inherent in profit-making private ownership of railroads.

Latin American Policy

NORMAN H. DAVIS, Undersecretary of State during the last year of Woodrow Wilson's Presidency, does not like the recent policy of the United States toward Latin America, and in an article in the July issue of *Foreign Affairs* turns his critical searchlight upon some of its features. Recalling the expectation that Mr. Hoover's visit, between his election and inauguration, would not only "appeal to the sentiment of the people of South America" but also give the new President "an invaluable background for dealing with Latin American problems," Mr. Davis declares that "there is no outward evidence of any amelioration of the hostility toward the United States which had been rising during the last years of the Coolidge Administration," and that resentment against the restrictions put upon imports from certain Latin American countries has been "greatly intensified" by the Smoot-Hawley tariff.

The tariff aside, Mr. Davis finds fault particularly with the reversal of American policy, formally announced by Secretary Stimson in an address in this city on February 6, regarding the recognition of new Latin American governments. Briefly stated, the new policy is to recognize a new government "on purely technical grounds without regard to its legal status," whereas President Wilson and Secretary Hughes aimed at "fostering the growth of democratic institutions and orderly government" by insisting that a revolu-

tionary government should receive constitutional indorsement by the people. Mr. Davis thinks it doubtful whether this disregard of "constitutional legitimacy" in the recognition of military dictatorships has furthered political stability in the countries concerned, and he even goes so far as to suggest that "though such a policy may not cause revolutions it tends to encourage rather than to discourage them."

The contention would carry more weight if Mr. Davis had not tried to support it by a defense of Wilson's course with the Huerta Government in Mexico in 1913. Mr. Davis credits Wilson with believing not only "that what the bulk of the Mexican people desired was democratic government," but also "that what the interests of this [the American] government demanded was stability in Mexico." It was an ill-assorted pair of dogmas, utilized in fact by Wilson to withhold recognition from Huerta on alleged moral grounds in the hope of getting eventually the kind of Mexican government he wanted. The Hoover-Stimson policy, of course, goes to the other extreme in extending recognition to a revolutionary government that is actually in power, but about the worst that can be said of it is that under it a revolutionary government may possibly be recognized too soon. There is always a chance of mistake in even the best-regulated diplomatic families.

Mr. Davis's apology for Wilson sticks out the more prominently because elsewhere in his article he comes out strongly against intervention. "None of the military interventions undertaken by the United States in the republics to the south," he declares flatly, "has resulted in any permanent benefit either to the people of the state in question or to the people of the United States themselves." If there be in Latin America at any time conditions which might in any case be held to justify intervention, they can be removed only by the people of those countries if the countries themselves are to remain independent. The United States cannot make people good by means of marines and warships.

Mr. Davis finds three main reasons for the "suspicion, fear, and latent hostility" which in general characterize Latin American feeling toward the United States. The first and most important is the tariff, with its gross discriminations in the treatment of Latin American trade. This difficulty, he thinks, might be met by giving to the Secretary of State a virtual veto on schedules which in his judgment "will prove fundamentally prejudicial to our Latin American relations"—an impossible proposal. The second is the misunderstanding and resentment which have resulted from our "insistence that the other American republics are not concerned in either the interpretation or the enforcement of the Monroe Doctrine." He would overcome this by having the United States abandon its claim to being the "sole arbiter" and invite the Latin American states to proclaim the principles of the doctrine "as an integral part of their own national policy." The third is intervention. Mr. Davis concedes the possibility of situations in which intervention might be necessary, but he is clear that it should be exercised, whatever its form, "only in conjunction with, or after consultation with, the other American republics." Congress may be relied upon to prevent the application of Mr. Davis's tariff remedy, but his other two proposals contemplate an enlightened policy of international cooperation which the United States, as the most conspicuous offender, should lose no time in trying to bring about.

Sentences for Writers

WE do not mean sentences in the rhetorical sense, but sentences for guilt, real guilt, for offenses against readers and public, sentences bestowed in court without benefit of clergy. What punishments would fit the crimes of some of our writers is what has been engrossing us ever since the news came that the third and last trial held in the London School of Economics, for the benefit of King Edward's Hospital, was of the very considerable corpus of Mr. Gilbert K. Chesterton. The charge against him was quite to the point—"perversely preferring the past to the present"—and there were citations without end by the prosecuting barristers from the works of the offender to prove his guilt. But the criminal in the box was agile in his own defense. He swore, on his soul, honor, and conscience, that he had never praised the Victorians or the Victorian Age. He had only praised Gladstone because he was the most radical of the Victorians. Nor had he ever glorified Cromwell or the Puritans, or written mushily of "Good Queen Bess." He had even described the England of the fifteenth century as "corrupt, diseased, and completely decadent"—a useful alibi, weakened, however, by his admission that he "had praised a short time during the very best period of the Middle Ages." Nor had he been "one of the thousand modern idiots who clamor for the resurrection of the Greek spirit."

All his wily cleverness availed Mr. Chesterton not at all. The jury, which was the audience, pronounced him clearly and irrevocably guilty—they knew him of old. A severe sentence was pronounced at once, without any recommendation for mercy. Chesterton was doomed to read every word that Edgar Wallace writes, also every speech made by Lord Brentford, the champion of Victorianism. More than that, he was ordered to produce another volume on "Father Brown" within the next six months—all with no alternative of a fine.

We confess we have been thrilled by this event and its possibilities. What could not be accomplished toward the reform of our liter'y fellers if we had such a tribunal here! We should, of course, prefer to pick the jurors ourselves. But even so, we'd take our chances with an average American audience if we could fix the entrance fee for the trial at, let us say, five dollars. Offenders? Plenty. There is the leader of our humanists, Irving Babbitt himself. He, too, would persistently and perversely face the past. That he would be judged guilty we have no doubt whatever—without the jury's leaving the box. The sentence is at our finger-tips: that he read a chapter of his abhorred Rousseau every day and that he be put under \$150,000 bond to read every line ever penned by his disciples—and may the Lord have mercy on his soul! As for our gentle, kindly William Lyon Phelps of Yale—against him the charge of humanism, or better humaneness, will also lie. His quality of mercy is not strained; on the contrary, unrestrained. What false hopes has he not raised in budding authors' breasts! His sentence? To read three novels a day in addition to the two he already devours and to read every eulogistic review that appears in the *Times* literary section. Two Draconian judgments? Aye, but well deserved!

Germany on the Brink*

By ALANSON B. HOUGHTON

WE speak of the war as having ended a dozen years ago. So, in a sense, it did. But in a larger sense, as an underlying cause of much that has occurred since, the war did not end then nor is it ended now, for even today we are paying its bills in terms of a world-wide depression in business and a world-wide unemployment.

I happened to be in England when the war began. I shall never forget the consternation, the actual horror, with which the war was greeted. The peoples did not want war. They did not hate one another. They asked only to be permitted to go on living undisturbed. But those in political authority over them had chosen war in preference to peace. And under their leadership those great civilized peoples turned from the helpful and upbuilding processes of peace to devote themselves wholly to the processes of destruction.

Then came the armistice. The cannon ceased to roar. The Central Powers acknowledged defeat. And the warring peoples turned to the problems of the peace. At the moment the Allied Powers apparently had but one thought—that Germany must repay them. According to the theory on which they had waged the war, Germany had wantonly brought it on. The German people must pay for the evil they had done. And they thereupon proceeded to assess against that unhappy people sums which were fantastic. But hate, as it happens, is not a measure of capacity to pay. It is a fever of the mind. And gradually, as the war fever lessened and the ability to recognize facts returned, it became plain that if Germany was, in fact, so far as possible, to repay the sums the war had cost the Allied peoples, the amount must be determined in more normal ways. And first by means of the Dawes Plan and later by means of the Young Plan, a series of annual payments, which will end in the year 1988 and will cover both interest and principal of the sum finally assessed against Germany, was imposed upon her.

That, however, was only half the problem. The financial relations between the Allied Powers and between them and the United States had still to be determined. The principal creditor nations were France, which had owing it about two and one-half billion dollars, mainly uncollectible, Great Britain, which had owing it about eleven billion dollars, a large part of which was uncollectible, and the United States, which had owing it about twelve billion dollars, which for the most part was collectible. A bitter controversy instantly arose between the Allied Powers and the United States. Our government took the position that as we had paid our own bills and taxed ourselves to the quick to help those associated with us, the nations owing us should in all fairness repay, as far as they could, the amounts they had borrowed. Those nations, in turn, asserted passionately that we had no moral right to ask repayment. Finally, Britain issued the so-called Balfour note and declared that it would demand of its creditors only such amounts as would pay its debts to the United States. That put the issue definitely up

to us. And our government then proceeded to make settlements with all the nations indebted to us. They were made professedly on the basis of capacity to pay. Speaking broadly, however, we neither sought to collect, nor did collect, the direct war debts at all. They were remitted. All we asked our friends to pay was what they had borrowed for other purposes indirectly related. It seems to me, I confess, that the settlement made was not ungenerous. In the arrangements subsequently worked out, Britain, France, and the others, by making the sums owing us a part of the German reparation payments, simply transferred to Germany the whole burden of their indebtedness to us, and inferentially at least, as I said, made their payments to us conditional upon Germany's payment to them. Naturally, to these arrangements our government has not agreed. It still maintains that those who borrowed from us, and not a third party, are responsible to us for payment. So far, no difficulty has arisen. Germany has made the necessary payments to her creditors. The United States has been paid by them in turn. And there, at the moment, the matter rests. Whether, in case of German default, the Allied Powers either would pay us, or could pay us, we do not know. The final responsibility has not been fixed.

Thus matters stood for some years. Then came the collapse. First in one country, then in another, business began to slacken. Unemployment began to assume formidable proportions. Even here in America we found ourselves caught in the same current. Naturally we asked ourselves the reasons for so tremendous a change. Many good people fear that we have demanded more of our debtors, already weakened by the war, than they could safely pay, and that they have broken down under the strain of our demands, and that, as a consequence, we are now all floundering in an economic slough of despond. These people point out that the depression is costing us untold sums annually and that what we are recovering by way of payments on the war debts is negligible by comparison. In grasping for the shadow, we have lost the substance. Our true course, they think, is plain.

Now, whatever else may be said regarding this argument, it must be obvious to you that it rests upon a misunderstanding of the facts. The Allied peoples are not groaning under the burden of what they owe us. They pay us nothing. They act merely as transfer agents, and pay us out of the reparation payments they have forced Germany to pay them. The burden of our war debts rests directly upon the German people. But if this were not so, are the annual payments made us of such size and importance as to justify us in believing their remission would contribute materially to world recovery? I would confess I doubt it. With the broad assumption that we shall prosper most by making trade with us easy rather than difficult, I find myself in cordial sympathy. I am sure that the time has passed when we can think of America in terms of comparative isolation. But the argument on this point relates, it seems to me, primarily, not to reparation payments, but to tariffs,

* An address delivered on June 9, 1931, at the Carnegie Institute of Technology. Mr. Houghton is not responsible for the condensation.

and with tariffs and their effect on trade and industry I have this morning, fortunately, nothing to do.

What we are interested in at the moment is to discover whether the remission of our war debts will materially aid in the restoration of normal conditions of economic life throughout the world. If we think of the situation in terms of international trade, the two hundred million odd dollars now paid us annually, which is perhaps 1 per cent of that trade, seems a wholly disproportionate amount to affect it seriously either way. The annual budgets of the nations with which we were associated during the war amounts, roughly, if we take for comparison the year 1930, to something like twelve thousand millions of dollars per year. In other words, the payments made us represent about $1\frac{1}{2}$ per cent of their annual budget expenditures. Under such conditions surely it is mere exaggeration to assert that these payments constitute an unbearable burden.

All this touches only indirectly and very slightly what I conceive to be the real problem involved in the war debts. And that is whether Germany, because of reasons beyond her control, is now so situated that she is unable to emerge from her present economic and financial difficulties without help. And that is a very serious problem indeed.

All the great industrial nations are suffering from the prevailing depression. Germany is suffering from its effect like the rest. But there are two respects in which it seems to me Germany's position differs from the position of the others. In the first place, Germany came out of the war bleached white and exhausted, her territory curtailed, deprived of some of her most valuable raw materials, her colonies gone, her governmental system destroyed, her entire economic structure disrupted and dislocated, her accumulated wealth largely dissipated, and, following this, she passed through a period of inflation which rendered her money valueless. No one who did not live through that period of inflation in Germany can imagine what it meant. It wiped out whole classes and left them penniless. Prices changed every few minutes. Wages paid Saturday night lost half their purchasing power by Sunday morning. I can myself remember when a postage stamp cost eight trillion marks. As I said, unless you yourself witnessed what went on during the period, you can have no adequate conception of its destructive force. Of course, to a greater or less extent that was the condition in which all the European countries found themselves, but none of the others to quite the same degree. Those factors in themselves made recovery difficult enough. But Germany, in addition, was made to pay for the damage she had wrought. A few hundred million dollars a year, you may say, was not too great a penalty to pay in view of the loads of debt the other nations were carrying. Possibly that is true, but only if Germany was able to get her industries running again and to recover her normal industrial strength. And that has not happened. Despite her honest efforts to reestablish herself, she has not succeeded.

Bear in mind, too, that what Germany was required to pay by way of reparations had to be paid outside of Germany. That meant Germany must pay either in goods or in gold. She found it impossible to sell enough goods. Her supply of gold is sharply limited. She has kept her payments up only by borrowing, with a consequent loss of her capital. And such a process, of course, cannot be kept up indefinitely. Sooner or later it must reach an end. During this calendar

year, for instance, Germany is obligated to pay the Allied Powers by way of reparation a little less than four hundred million dollars, on top of all her previous payments, and in addition she is obligated for the next sixty years to make similar payments, varying in amounts, it is true, but aggregating, in principal and interest, something more than twenty-six thousand million dollars. Possibly Germany can make these payments. I do not know. But I am sure that she cannot make them unless she can bring her productive power back somewhere near to normal. Otherwise she will simply be drained dry. The plain truth is that Germany has paid her creditors more than she could induce them to take from her in the form of goods. Her capital has been drawn upon to furnish the difference. And in the doing she has lost, in no small degree, all those imponderables which surround credit and give it life. How long, I ask you, can we, as reasonable human beings, expect that process to continue?

The second respect in which the position of the German people differs from that of the others concerns the war guilt charged against her. There is no power strong enough to force a people to pay a debt unless they are willing to pay it. And it may be in the end that we shall find the most formidable obstacle of all, as affecting the willingness of the German people to continue reparation payments, is the fact that the huge sums fastened on them by way of reparations are fastened on them, not because Germany lost the war, but because, as stated in the treaty of peace, Germany alone bears the guilt of the war. Now I need not tell you that the German people not only do not believe this but passionately resent it. Nor, I suspect, do any competent students of the facts now believe such a statement to be true. To base the claim for reparation payments simply on that guilt, on what they believe to be a political lie, the Germans regard as unfair and dishonest. They will do all in their power to perform a reasonable task. But when after trial that task appears to them impossible of performance, I am afraid that, very much as we would do ourselves, they will turn from it in anger and despair. I cannot think of anything more unfortunate for the world than the collapse of Germany at the present moment. And that collapse, unless some help is extended her, must not be regarded either as impossible or perhaps far removed in time.

Twelve years after the war the situation is not improving and may be changing for the worse. Germany, I am inclined to believe, has been pushed about as far as she can go. That this is partly her own fault, I have no doubt whatever. That, however, does not affect the net result. I can think of no good to the world which would come from Germany's complete break-down. I do not like to think of the possible effect on Western civilization of Central Europe in social chaos. But of this I do feel sure—such events would not aid us or the other nations toward economic recovery.

If Germany is to be afforded relief by the remission or suspension of her reparation payments for two years or five years, or until her economic and financial situation is sufficiently improved to enable her again to take up the burden of those payments without probable collapse, that relief must be afforded by all the nations concerned and not by America alone. We should be prepared, it seems to me, if the other nations are ready, to make our contribution. I am not sure that we are so prepared. I am sure only that we ought to be.

President Hoover's Record

II. President Hoover's Foreign Policy*

By JOHN B. WHITTON

A FOREIGN policy in the main disappointing has been pricked out by the Hoover Administration. It is true that certain notable achievements deserve warm praise. A new spirit, particularly a sincere effort to understand the viewpoints of foreign countries, distinguished Mr. Hoover from his predecessor. His policy toward Latin America, with some exceptions, has been broad-minded and progressive. On the other hand, in most of the expressions of his foreign policy Mr. Hoover has been a great disappointment, even to many of his warmest friends. His treatment of the World Court, the proposed consultative pact, and the tariff, for example, has been a severe blow to the cause of peace. Nor could Mr. Hoover parry the blame by seeking shelter behind outworn traditions of isolation, or that really formidable obstacle, the United States Senate. For in notable instances the fault has rested upon the shoulders of a timorous President, obsessed by personal timidity or political fear.

I. LATIN AMERICAN RELATIONS

Progress and retrogression, boldness and timidity, wisdom and indiscretion—this curious melange so typical of Mr. Hoover's own paradoxical character—mark his foreign policy generally. This is admirably exemplified in his Latin American policy. The President approached these perilously delicate problems with a serious purpose and open mind almost unique in our history. By embarking upon his goodwill tour, he did more than avoid the army of office-seekers waiting at home. He desired to study our Latin American relations on the spot, and gain thereby a personal understanding of the existing difficulties. Even of greater importance to our southern neighbors, to whom questions of form are so vital, Mr. Hoover was making a gracious gesture which they appreciated deeply, and will not soon forget. It is true, however, that his avowed purpose—the spreading of good-will—would have come nearer achievement had he been better advised. He needed some Western Pierre de Fouquières, the famous master of ceremonies attached to the President of France, to guide him through the shoals of diplomatic precedence and international courtesy. For example, by stopping at San José, the capital of Costa Rica, Mr. Hoover unwittingly caused an affront to less-favored Central American republics. Nevertheless, his pre-inauguration tour was, in the main, a success. He learned personally of certain defects, notably our inadequate diplomatic service, which he has worked diligently to remedy. Finally, although handicapped by the platitudinous words and blundering acts of his predecessor, he seems to have convinced Latin America of his good faith.

Mr. Hoover has materially strengthened our diplomatic

service in Latin America. In the past great harm has been done our legitimate interests by intrusting important diplomatic posts to incompetent political appointees. When a new revolution creates delicate questions of law and policy, it is unfortunate to have on the spot a minister whose sole bid for fame is his prowess as a poker player. The President has sought a remedy for this situation. In his message of December 3, 1929, he promised to "secure men long experienced in our diplomatic service, who speak the languages of the peoples to whom they are accredited, as chiefs of our diplomatic missions in these [Latin American] states." In other words, the President believes a diplomat should be competent—an excellent principle which, alas, he disregarded when he filled most of the major European ambassadorships! But in Latin America he has changed most of the heads of mission, and has replaced them with career men who know the local language. This is an immense improvement. Some of his appointees, however, seem to have few qualities other than the fact that they are career men and excellent linguists. Their ability properly to handle a delicate situation has never been demonstrated. On the other hand, if they are the best men available, neither the President nor the State Department is to blame. At all events, it is highly significant that while Latin American posts used to be shunned and abhorred, today they are actually sought out by ambitious career men.

But the greatest accomplishment of the Administration is a new policy toward the troubled republics of Central America and the Caribbean. President Hoover is responsible for a series of acts which almost amount to non-intervention. This forward policy is well illustrated in Haiti. The President met unrest and disorder there, not by an increase of force or an intensification of oppression, but by sending the Forbes Commission. Treating this body with more consideration than some of his domestic "fact-finding commissions," Mr. Hoover followed its excellent advice by providing for new elections, the restoration of a democratic regime, and the replacement of the military commissioner by a regular minister. Mr. Dana G. Munro was given this post. The fact that the elections returned to power officials firmly opposed to our policy did not deter the President from his purpose. Nor did he refuse to accept as Minister from Haiti M. Dantes Bellegarde, although the latter had been remarkably loud and bitterly frank in his attacks on our Haitian policy. Mr. Hoover also appointed the Moton Commission to investigate the educational system, nor did he flinch when this body brought in a long series of recommendations which exposed serious errors in our administration. On the other hand, he did blunder last November by attempting to appoint an undesirable American as the head of agricultural education, and thus unnecessarily caused the resignation of the Haitian Cabinet. But we have gone ahead with our plans to withdraw, and have promised to be out of Haiti by 1936.

* The second of a series of ten articles on President Hoover's Record. The third, on Mr. Hoover's Economics, by Henry Raymond Mussey, will appear in our next issue.

The present article was written, of course, before President Hoover proposed a one-year suspension of payments on war debts and reparations.—EDITOR THE NATION.

In Nicaragua, too, the Administration has promised to leave the country. After the elections of November, 1932, we shall have no more marines to fight their way through the swamps in search of Sandino. To that end we are busy organizing a local *guardia* to maintain order. On the other hand, we may find difficulty in keeping out. If, in accord with Mr. Hoover's apparent determination, we insist upon building the Nicaraguan canal, we shall be forced into such intimate relationship with the local state as to make it little more than a protectorate. The fear of the "Colossus of the North" which Mr. Hoover is resolutely striving to assuage would then break out afresh. Furthermore, Nicaragua is far from pacified. Despite the loss of over 100 marines and 3,000 Nicaraguans, Sandino is still at large. Finally, it would seem difficult for us to refrain from meddling in the affairs of Nicaragua so long as we remain faithful to the policy of recognition which, illogically enough, we apply in Central America alone and nowhere else in the world. If we may judge from past experience, this policy may oblige us to interfere in local politics, often to the detriment of the interests of both the little republic and our own country. It may force us, perhaps against our own desires, toward renewed intervention. Then will come the real test of the new policy.

In other respects the tendency of our policy seems to be away from intervention. In Panama a revolution ended quickly in a change of regime. But we did not intervene. That we should remain neutral in a country wherein we have such vital interests is a good omen for the future. The same may be said of Santo Domingo, the seat of former interventions on our part. There another successful revolution occurred, and we did not intervene. Finally, our State Department published the famous Clark Memorandum, thus apparently binding the present Administration to a significant interpretation of the Monroe Doctrine. In this document it was denied that an intervention in a disordered country could be justified, as a corollary of the Monroe Doctrine, as being necessary in order to forestall a possible European intervention. Here the Administration might have removed a thorn long festering in the side of our southern neighbors. But the thorn will remain as long as these states know that we have on tap other excuses for intervention. We can allege, as we have done before, the necessity either of protecting American lives or of safeguarding the Panama Canal. Latin Americans may remember, too, that Mr. Kellogg invoked, as one pretext for going into Nicaragua, the danger of bolshevism!

II. THE LONDON NAVAL TREATY

The London naval treaty is claimed by the Administration as an outstanding achievement. Whether or not these pretensions are wholly justified, Mr. Hoover does deserve great credit for the London conference and its results. The President carried on the Rapidan negotiations with skill and tact, and thereby quickened immeasurably our friendship with Britain. Furthermore, he appointed as delegates to London men of high distinction and broad experience; if they did not always live up to their reputations it was not the President's fault. Unlike Mr. Wilson at Versailles, Mr. Hoover saw to it that all parties were represented on the delegation.

The President was less prudent, however, when he

sought to defend the treaty. He was indiscreet in comparing the tonnage authorized at London with that proposed by the British at the Geneva conference of 1927. Although he was thus able to show a reduction of over 500,000 tons, his position looked rather lame when it appeared that the British proposals at Geneva were highly exaggerated and had never been seriously considered. It was noted also that our fleet, at the opening of the London conference, was only 7,000 tons above the tonnage to which we were entitled under the London treaty. The claim that economies would be realized under the new accord was not very convincing before the revelation that it would cost us over a billion dollars to build up to the treaty limits. On the other hand, it is legitimate to hope that the treaty will initiate such an era of good feeling that the Powers will refrain from constructing up to the legal limit. Certainly we have achieved naval parity with the greatest sea Power, and have established a stable equilibrium in relation to Japan. Furthermore, the way is paved for naval agreement between France and Italy. Above all, that step was taken which, if the general disarmament conference of 1932 has any chance to succeed, was absolutely essential. Finally, no battleships are likely to be built before 1936, the stabilization of the great naval fleets of the world has been effected, and, in fact if not in law, substantial economies are almost bound to result. The naval-armaments race, at least for the moment, has been halted.

These are substantial gains. Due credit therefor should be accorded the Administration. But criticism, as well as praise, should be bestowed where it is deserved. It is hard to forget that President Hoover, in his Armistice Day address in 1929, declared as follows: "We will reduce our naval strength in proportion to any other. Having said that, it only remains for the others to say how low they will go. *It cannot be too low for us.*" (*Italics mine.*) Utterly inconsistent with this pronouncement was our stand at London on battleships and aircraft carriers. We prevented the general abolition of the battleship. We alone opposed the plan to reduce the limit for aircraft carriers from 135,000 tons to 100,000 tons.

But our most extraordinary failing at London was with relation to the great vital problem of disarmament—security, sanctions, and the freedom of the seas. This, together with the question of Franco-Italian parity, was the very crux of the situation. Our delegation did not seem to realize this truth. With respect to these major questions they arrived at London apparently unprepared. Above all, they were not ready to meet the proposal which was inevitable and unavoidable: that in case of a collective war waged against an aggressor nation the United States should promise that after determining for itself who was the aggressor, it would not trade with the latter. The circumstances are inexorable: France will not disarm without security; security is impossible without the active assistance of Great Britain against the aggressor; Great Britain refuses to promise such support so long as it fears a clash with the United States over the freedom of the seas. The force of these truths our Administration has not realized. In fact, again and again Mr. Hoover has stated that there are two roads toward peace: the European, founded upon the use of force against the aggressor, and our own, based on mobilizing public opinion against a wrongdoer. While he has refused to

travel the European road, Mr. Hoover, unlike Mr. Coolidge, has shown an admirable spirit of deference toward the European viewpoint. Nevertheless, he cannot fully understand Europe's problems, or he would not have made the proposal, in two successive Armistice Day addresses, for food-ship immunity, when it was clear that this plan was opposed not only to the sanctions system and modern conceptions of warfare, but to public opinion generally in Europe.

Our policy at London in this matter was vacillating, to say the least. At first we declined absolutely to consider any proposal for cooperation with Europe's efforts to enforce peace through collective action. In fact, we even opposed the project for a consultative pact. Our position in this respect was pitifully weak. First we claimed that a consultative pact would be as dangerous as the Entente Cordiale, although the two agreements were so utterly different that the analogy seemed almost silly. Then we found ourselves in a most illogical position: we could not explain why, having already accepted a four-Power consultative pact for the Pacific, we could not do likewise for the Atlantic. Everyone realized, too, that without a consultative pact the Washington arms treaty could never have been achieved. It is true that at the last moment Mr. Stimson did execute a right-about-face and imply that we might consider some kind of consultative agreement. But this move, made by our London delegation, did not have the support of Washington. Moreover, it came too late to save the five-Power treaty. The matter is still of first importance. It is bound to come up again in 1932 at the general disarmament conference. Our Administration might as well realize at once that real disarmament cannot come without security, and that security is impossible without the active cooperation of the United States. Here is a magnificent opportunity for executive leadership, if courageous and enlightened.

III. INTERNATIONAL COOPERATION

In the general field of international cooperation the ledger of the Administration again shows both credit and debit items. With the rest of the world we cooperate heartily by sending official delegations to numerous international conferences. We collaborate with practically all League of Nations activities of a non-political nature. In the realm of disarmament, although this question is largely political, we are working in cordial and useful partnership with League organs. Again and again Mr. Hoover has lauded the Briand-Kellogg Pact, and has warmly favored implementing it through disarmament, arbitration, and conciliation.

On the other hand, friends of the League of Nations cannot forget that the President, in speaking of that institution, said in 1920: "I believe it is the hope of practically the whole of the American people that we may enter upon this great experiment in its broad sense." He also declared: "The essential thing is that the Republican Party has pledged itself . . . that they undertake the fundamental mission to put into living being the principle of an organized association of nations for the preservation of peace. The carrying out of that promise is *the test of the entire sincerity, integrity, and statesmanship of the Republican Party.*" (Italics mine.) And yet Mr. Hoover has not advanced us one step toward the League!

The Hawley-Smoot tariff bill, despite protests from

twenty foreign countries, finally became law, and was immediately followed by reprisals in a dozen countries. Nothing in years, except our attitude toward the inter-Allied debts, has done so much to make us feared and disliked abroad, and generally considered the international dog-in-the-manger par excellence. But the President, who certainly must have foreseen the dangers to our international relations, not only failed to veto the bill, but throughout the entire tariff fight showed an amazing lack of constructive leadership.

Timorous again, he has given only the most guarded—we almost said half-hearted—encouragement to plans for mobilizing public opinion against a violator of the Briand-Kellogg Pact. This hesitation is regrettable. It is incomprehensible, too, when we consider that twice the Administration took the initiative in reminding China and Russia, at blows over the Chinese-Eastern Railway dispute, of their obligations under the pact. Weak in words, somewhat stronger in acts, the policy of the Administration lacks the certainty and consistency which are essential if the anti-war treaty is to become a vital force for peace.

In this matter of collective measures for peace the most disappointing expression of the President's foreign policy has been his attitude toward the World Court. As early as December 9, 1929, with admirable promptness, our representatives signed the protocols which, based on the Root plan, provided for our entrance into the Permanent Court of International Justice. In his message of December 3, 1929, the President had enthusiastically praised the court, and had promised to submit the protocols to the Senate "when it is convenient to deal with it." But he actually waited over a year before fulfilling this promise. It was only on December 10, 1930, that he submitted the protocols to the Senate. While his message praised the court, it did so without enthusiasm, almost without conviction. This was to be expected, for it had already been announced from Washington that the submission was to be a mere gesture of good faith toward those who supported the court!

The President refrained from submitting the protocols during the 1929-30 session for *fear* of compromising the approval of the London naval treaty. He did not want the protocols considered in the 1930-31 session for *fear* of interfering with appropriation and emergency measures. He also *feared* that a special session might have been necessitated. Friends of the court were convinced, however, that a President less obsessed by political fears would have made a more valiant and more effective fight for ratification. It is not easy to understand why his speeches of December, 1930, were less enthusiastic for the court than his words of December, 1929. Above all, it is not clear why, if the President could call the Senate *alone* in order to consider the naval treaty, thereby avoiding the dangers of a special session, he could not have done likewise for the court. Here the fault does not rest with the Senate. Nor can our inaction be explained as a corollary of the overworked doctrine of American isolation. The fact that five years after the Senate, by a vote of 76 to 17, voted for adherence to the court, consideration of the protocols has again been postponed for at least a year, and that we have thus fallen still farther behind in the general world movement for the peaceful settlement of international disputes, would seem to be the fault of the President himself.

Free Speech in Childhood

By BERTRAND RUSSELL

I WAS brought up on the great Liberal watchwords, of which freedom of speech was one of the chief. But like all the other liberties of the Victorian Age, there was a catch in it. Adults were to have freedom of speech, but only after they had listened for twenty-one years to all their elders saying "Hush! hush!" whenever they opened their lips. The result was what is called liberty without license, that is, liberty without knowing how to use it. Our age has not the capacity for compromise that belonged to the age of our grandfathers. Most people have ceased to believe in free speech, while those who continue to believe in it, of whom I am one, believe that it is good even for children.

At Beacon Hill School, on the South Downs, my wife and I are putting into practice our theories of education. We are now at the end of the fourth year, and are beginning to be in a position to say something of results. The children in our school are not completely free, as some newspaper reports have represented them as being, but they do have complete freedom of speech. No child is ever told "You ought not to say that." I have met people who imagined that they practiced this policy, but in general they deceived themselves. Almost everybody has a theory as to what children are like, and is displeased when children say things tending to disprove this theory. And although we can all remember despising our own parents and teachers, we like to think that the young whose parents and teachers we are have an attitude totally unlike that which we had in youth. It is thought also that while freedom of speech, in general, is all very well, it must, of course, be subject to the limitations imposed by good taste. At Beacon Hill School such limitations are not imposed. There is no check upon irreverence toward elders and betters, no check upon scientific curiosity, and no check upon the choice of words.

The advantages of this system are numerous. In the first place, it is more or less possible, within limits, to know what the children are thinking. The technique of psychoanalysis has been invented to undo the effects of the "Hush! hush!" policy by teaching people to say what hitherto they have only thought. We think it is rather a mistake to give people an expensive education in concealment resulting in nervous disorders, and then give them an expensive reeducation to break down the concealment and possibly cure the nervous disorders. When children are left free as regards their language, they say from time to time such things as Freudian textbooks assert that they must be thinking; but being able to express their thoughts freely, they are not obliged to give them some fantastic form and become to that extent out of touch with reality.

I regard a robust sense of reality as a very valuable possession. Children are, to begin with, ignorant but full of scientific curiosity. The purpose of conventional education is to leave them still ignorant, but to destroy their scientific curiosity. For this there are various motives, political, religious, and moral, but all of them have their source in a deep-seated fear of reality. The orthodox view seems to be

that God made the world, but that it is so horrid we had better know as little about it as possible. For my part, I accept neither premise nor conclusion in this argument. By the mere tolerance of free speech we avoid destroying the natural scientific impulses of children.

I am often asked: "What will happen to your children when they are brought into contact with the real world?" People have an idea that we are creating an artificial paradise, from which they will emerge to find to their surprise that the world contains evils. I consider, on the contrary, that this is the usual practice in education, and that our peculiarity consists in not presenting a fairy-tale world to the child's imagination. In ordinary education the child is brought up to believe, or at least to pretend to believe, that his parents and teachers are impeccable, that his country is always right, that statesmen of his own country and political party are invariably high-minded, that the wicked are easily discerned and invariably defeated in the end, and that only persons of rare depravity such as one is very unlikely to meet would be guilty of any sexual irregularity. Captains of industry, proprietors of great newspapers, admirals, generals, privy councilors, and such are represented as invariably guided by the loftiest public spirit. When the young man goes out into the world and begins to see through all these amiable falsehoods, he almost inevitably becomes a cynic.

From a narrowly educational point of view the effects of free speech are amazingly good, not only as regards the scientific outlook, but also in literary ways. To begin with the scientific aspect. The absence of the sex taboo is much more important than is generally thought, especially, I think, for girls. Most boys who have a scientific bent are interested primarily in machines, where the sex taboo is of no hindrance. We find accordingly that civilizations which are dominated by the machine are an outcome of Puritanism. Girls, however, if they have a scientific bent, tend as a rule to be biological in their interests. The teaching of biology is rendered very difficult by the sex taboo. Anatomy and physiology as presented in books designed for children always stop short at a certain point. The children perceive this, and conclude that the matters omitted are not suitable for scientific treatment; they think about them all the more, but fantastically, not rationally. The fantastic ideas that they acquire in childhood sink gradually into the unconscious, whence they dominate adult behavior, making it the ridiculous and irrational absurdity that it generally is. And in this process the scientific interests of intelligent girls are blocked. If later on they study, say, medicine, they have to overcome inhibitions, which they can do only with the intellect, not with the feelings. A doctor's understanding of a patient's body ought to be effected not only by the brain but also by the viscera. As a rule, however, the viscera and the brain have become disconnected as a result of early taboos.

As regards literature, the children's diction is exact and expressive, their emotions clothe themselves spontaneously in appropriate language, and they do not acquire that bookishness which is the bane of artificial culture. They produce

poems which are suggested by the ordinary sights and events of their everyday life, and not by imitation of some poet who imitated some poet who imitated some poet who imitated Homer. The only respect in which they imitate Homer is that most of their poems are produced not by a single author, but by a syndicate. The same thing applies to plays. Each term they compose a play in which, broadly speaking, each actor invents his or her own part, though other children may on occasion contribute suggestions. They make their own costumes, and in general put in a few songs for which they compose the music. They used to insist upon everybody dying at the end, but now they are generally content with one murder. In poetry, however, they are much more serious. Some poems are individual, but more frequently they sit round in a group and all contribute, though the subject may be suggested by one among them. The oldest among them is just eleven, but he is not a great contributor to the poems. In fact the two best poets are only seven years old. This aspect of their work is best illustrated by an example.

IN THE GRAVEYARD

Sitting on a gravestone
I saw an old crone,
Counting yew berries
And shriveled-up cherries,
Weaving nettles
And tearing petals.

"Have you seen my husband
Wandering around,
Ghost from the graveyard
Out of the ground?"
I answered: "No, crone,
Nothing I've seen
Except one shin-bone
With flesh between."

Up rose the moon high;
Three shadows danced by:
One was her husband,
One was her child,
One was her love-bird
Weird and wild.

She threw
Cherries at her husband,
Berries at her child,
And a little shirt of nettles
For her love-bird wild.

I could give many other examples, but this ought to suffice to dispel the idea that a scientific attitude is inimical to the imagination. I firmly believe that our methods enable a child to acquire knowledge without losing the joy of life. I hoped that this might be the case when we founded the school, but my hopes are now confirmed by nearly four years' experience.

Yellow-Dog Contracts for Teachers

By HENRY R. LINVILLE

DURING the school year of 1929-30 another mile post of reaction was set up on the Pacific Coast, this time in Washington. The State Supreme Court on December 2, 1930, upheld the decision of a lower court which had dismissed an injunction sought by the Teachers Union of Seattle to restrain the school board of that city from denying employment to members of the American Federation of Teachers. Mr. Justice Beals dissented.

In May, 1928, the Seattle school board adopted the following resolution:

That no person be employed hereafter, or continued in the employ of the district, as a teacher while a member of the American Federation of Teachers or any local thereof; and that before any election shall be considered binding, such teacher shall sign a declaration to the following effect: "I hereby declare that I am not a member of the American Federation of Teachers or any local thereof, and will not become a member during the term of this contract."

The opinion of the majority of the court admits the existence of the statute guaranteeing the right of membership in unions:

It shall be lawful for working men and women to organize themselves into or carry on labor unions, for the purpose of lessening the hours of labor or increasing the wages or bettering the conditions of the members of such organizations; or carry out their legitimate purposes by any lawful means.

The court maintains, however, that this statute has no ap-

plication to the case under consideration, since the school board is "not undertaking to discharge anyone, but is only defining its course in exercising its power to employ in the future." Neither does the Fourteenth Amendment to the Constitution of the United States protect union teachers in the right of union membership. The right of freedom of contract is held to be inviolable, and the court cites with approval the decision of the Illinois Supreme Court in 1917 validating the "Loeb rule" of the Chicago board:

The board has the absolute right to decline to employ or reemploy any applicant for any reason whatever, or for no reason at all. . . . It is no infringement upon the constitutional rights of anyone for the board to decline to employ him as a teacher in the schools, and it is immaterial whether the reason for the refusal to employ him is because the applicant is married or unmarried, is of fair complexion or dark, is or is not a member of a trade union, or whether no reason is given for such refusal. The board is not bound to give any reason for its action. It is free to contract with whomsoever it chooses. Neither the Constitution nor the statute places any restriction upon this right of the board to contract, and no one has any grievance which the courts will recognize simply because the board of education refuses to contract with him or her. Questions of policy are solely for the determination of the board, and when they have once been determined by it the courts will not inquire into their propriety.

These words indicate accurately the actual legal situation of teachers in these States.

Mr. Justice Beals, dissenting, agrees that "both the school board and the teachers are free agents and are at liberty to enter into such contracts or not, as they may desire." He believes, however, that the question presented goes farther than this, saying:

There is a great difference between the exercise of the judgment and discretion which school boards must exercise in contracting with teachers and the laying down in advance of a definite rule whereby certain persons are excluded from such employment for reasons having nothing to do with their moral or physical characteristics, their educational qualifications, or their general ability as teachers. . . . It must certainly be admitted that a school board could not resolve that it would employ as a teacher no one who was over six feet or under five feet four inches in height, or who possessed or failed to possess some other physical characteristic wholly irrelevant to the teaching ability of its possessor. The action of a board in insisting upon the maintenance of any such whimsical standard would certainly be restrained by the courts. . . . I am not disposed to hold that qualified and capable teachers, as a condition precedent to employment, may be required to sign such a stipulation [not to belong to a union], which it is beyond the power of the school board to enforce by discharge, if violated by the teacher.

He concludes that the school board exceeded its lawful authority, and that the judgment appealed from should be reversed.

Decisions by the Ohio Supreme Court, also cited by the Washington Supreme Court, support the Illinois court's conception of the right of school boards to impose on teachers any restriction whatever as a condition of employment. Since Justice Beals agrees with the majority in the right of freedom to contract, it is difficult to see how he can withhold acceptance of the position taken by the Supreme Courts in the three States mentioned. Furthermore, the hypothetical case of refusing employment to teachers over six feet or under five feet four in height happens to be of no help, especially as just such restrictions (against low stature) are now being set up by school boards. In fact, many new qualifications of teachers are being formulated in matters relating to physical appearance, dress, health, speech, and "personality."

Perhaps the lawyers can see (as Justice Beals does) how a teacher working under a yellow-dog contract could escape dismissal while actually belonging to a teachers' union, because of the statute guaranteeing the right to belong to trade unions. But to those familiar with the arbitrary customs of school boards there would appear to be no chance for an honest union teacher in places where the school board bans teachers' unions.

There have been many antagonistic reactions to the organization of teachers' unions in this country. Prominent educators have pointed out the "unprofessional" conduct of teachers who would organize a union, and many boards of education and other educational officers have seen such organizations as "menaces" and have accomplished their destruction in various parts of the country—in New England, the Middle West, the Far West, and the South. In the three States of Illinois, Ohio, and Washington the most powerful agency of reaction in organized society, the courts, has come to the support of these other authorities. The slow progress in the organization of teachers' unions in this country is easily understood when it is realized that the mem-

bers of the profession are generally timid, unfamiliar with social problems, and easily persuaded to conform.

The locals of the American Federation of Teachers, in the fifteen years of the existence of the national organization, have put up several splendid fights for existence. In Chicago the "Loeb rule" was rendered ineffective, and even the decision of the Supreme Court of Illinois in upholding the yellow-dog contract is no longer invoked in that State. In New England the backwash of the Boston policemen's strike swept all teachers' unions out of existence, but they are coming back. In Pennsylvania a reactionary State superintendent of public instruction declared all teachers' unions unlawful, but there, too, such unions are slowly recovering. In New York the Teachers Union of New York City has fought valiantly and successfully against Lusk school laws, history-censorship bills, and numerous "strike" bills introduced by self-seeking school officials. In California teachers' unions constitute the fighting front to keep a teachers' tenure law that was won after a hard struggle.

But the struggle of a small band of not more than one hundred Seattle teachers is perhaps the most challenging of all. When the first action to enjoin the school board from enforcing the yellow-dog contract failed, the members of the union realized that they were in for a long, hard fight. It was agreed that all but one of the members should give up their membership in the union, and that the remaining one should become president of the local and with the help of other teachers, not in the employ of the school board, should hold the charter and prepare to carry the fight to the Supreme Court of the United States if necessary.

The school elections of March, 1929 and 1930, were hotly contested, the fight centering about the union issue. The liberal forces in March, 1929, succeeded in electing for a short term Judge Austin E. Griffiths, a retired judge of the Superior Court living in Seattle, who became the chief proponent of justice for the teachers. In 1930 he was defeated by a very small majority, but the showing made by the union forces was an impressive one. Moved apparently by this political situation, on January 2, 1931, the school board of Seattle lifted the ban against the union and promised that the teachers' contracts for the next school year, beginning September 1, 1931, would not contain the yellow-dog provision. Moreover, the board elected as its new president a member who was chosen two years ago by the liberal element in Seattle, the supporters of the teachers' cause. The school board earlier had granted many of the demands of the union, except increases in salaries, and had made many promotions of teachers who had been active in the union. But it now seems certain that the teacher who led this fight will not be reemployed, because an example is needed by the school board as a warning to the "rebels."

The hostile decision of the Washington Supreme Court stands, however, and there seems to be little doubt that similar decisions could be secured in other States. One possible line of action is the advocacy of laws against yellow-dog contracts in the several States, such as those recently passed in Colorado and Ohio. The popular conception of the teacher's function may have to be reversed. For a teacher in the changing social order must become a creative force, demanding and securing, as a necessary condition of meeting his social obligation, freedom to think and to teach how to think as well as how to do.

In the Driftway

PSYCHOLOGISTS have tried to explain what it is about flying that so appeals to the human mind; but they have never explained it to the Drifter. For although he has often flown by airplane, only for a few moments has he felt any relation to the earth on these aerial journeys; and one flies, in an emotional sense, only when one's movements are physically contrasted with the stability of *terra firma*. For a little while, of course, when the landing field swirls around below as you bank against the breeze, you gauge your moments by the earthly standard, and then you feel a thrill—or at any rate, the Drifter does. But, all in all, the true way to appease the eternal longing for flight is through certain devices unappreciated by the aeronautical engineers. One of these consists of a tin can tied to the foot by a piece of string, the string extending to the hand, which holds it taut. A couple of these, and you are off for a breathless escape from mundane locomotion—if you are young enough, that is.

* * * * *

EVEN if you are older than the tin-can stage, there is no need for discouragement. It came back to the Drifter once upon a time as he stood in the Prado, at Madrid, and looked hungrily at Goya's painting of the Stilt-walkers. Two men in knee breeches are strutting about on high stilts, their feet almost level with the heads of two companions who with small trumpets furnish music for the stilt dancing of the lofty entertainers. An admiring crowd of men and boys is hanging around ready, in a moment, to toss them their *centimos*. Looking at the picture, painted more than a hundred years ago, the Drifter realized the truth of Goya's understanding; for by using stilts you obtain a leverage on earth, and fly with what seems dizzying velocity to the earthbound.

* * * * *

A WEEK later the Drifter found a youth practicing this delicate art in a side street of a village in old Aragon. He found it, too, in Catalonia. Every Catalan knows his native dances, and if you will sneak into a certain square near the waterfront of Barcelona at eleven o'clock of a Sunday morning, you will see all of them at it, one after another joining in the intricate steps as unaffectedly as an American boy "horns in" on a baseball game of choose-up-sides. In these dances you might, even now, catch sight of some elderly man with a red liberty cap hanging over one ear, with a blue peasant's blouse and nondescript trousers, leaping high into the air in a vain effort to satisfy an urge as old as humankind. But the Drifter saw, not without grinning at the ultimate triumph of the machine even here, two small boys doing far better than their old granddad by means of rude stilts on which they soared o'er hill and dale, or, to be realistic, o'er drain and gutter.

* * * * *

STILL later, in old Provence, in a twenty-foot alley selected because it was the broadest avenue in this dusty town of the Midi, the Drifter found a crowd gathered where

weird music rose into the mellow air, and where, over the heads of miscellaneous Provençals, a whirling gleam of yellow and fire-red lured the curious eye. Elbowing his way amiably into the enthralled ring of onlookers, he discovered that Goya might as well be living now; for here were his stilt-walkers once more, busy in a dance of incredible abandon. One of these whirligigs was a girl of twelve, the other a madly graceful young woman who might have been a *gitana* of the Romany strain. And just to cheer the soul of Goya, should he be looking down from some Elysian eminence, two indefatigable musicians tooted on trumpet and sawed on fiddle, varying their themes, liar though you think the Drifter is, from a quaint old folk-tune of the Bouche-du-Rhône to the strains and stresses of the "Maine Stein Song." Or, shall we say, from the happy valleys of Provence to the Rudy—but no, even the Drifter will not say it.

Correspondence

Not Our Business

TO THE EDITOR OF THE NATION:

SIR: Your editorial Roosevelt, Ritchie, and Pinchot cannot but fill even your friends with confusion and impatience. There are those who want to follow you, and whither do you lead them but to the morass of the most futile negativism? In succession you demolish Hoover, Pinchot, Roosevelt, Ritchie, and Young. Very well, then, name your candidate. Bring him out into the open where he too can be sniped at. And having named him fight for him.

Wilton, Conn., June 13

THOMAS H. DICKINSON

The Scottsboro Case

TO THE EDITOR OF THE NATION:

SIR: Because I have been so busy working on the Scottsboro case, the article on that case published in your issue of June 3 has just come to my attention. With a good deal that was said I agree, but the effort to whitewash the attorney Stephen Roddy, whether that was conscious or unconscious, seems to me most unfortunate for the cause of the boys themselves, in which, as you rightly say, all of us are primarily interested.

In order to put plainly and without prejudice Mr. Roddy's connection with these cases I quote his own words:

If I was paid down here and employed it would be a different thing, but I have not prepared this case for trial and have only been called into it by people who are interested in these boys from Chattanooga. Now, they have not given me an opportunity to prepare the case and I am not familiar with the procedure in Alabama, but I merely came down here as a friend of people who are interested and not as paid counsel. . . . I am merely here at the solicitation of people who have become interested in this case, without any payment of fee and without any preparation for trial, and I think the boys would be better off if I step entirely out of the case according to my way of looking at it and

according to my lack of preparation of it and not being familiar with the procedure in Alabama. [Weems-Norris record, pp. 4-5.]

Mr. Roddy did not interview any of the nine defendants before their arraignment. The only time that he talked to them at all was in the courtroom, just before they were tried. At not one of the four trials at Scottsboro did Stephen Roddy, who according to his own account was entirely unprepared, ask for an adjournment in order that he might prepare. At not one of these trials did he even sum up for his clients (*cf.* Patterson record, p. 96). At not one of these trials did he make a single objection to the charge given by the judge, and it is to be remembered that these nine Negroes were being tried for an offense the punishment of which was death.

The National Association for the Advancement of Colored People has the four records of these trials. What does that organization think of Mr. Roddy? If *The Nation* obtained its information from the association, it is extraordinary that the article published mentioned Mr. Roddy only to praise him. Incidentally, Mr. Roddy at no time suggested that he was retained by the National Association for the Advancement of Colored People and said distinctly upon the motion for a new trial on June 5 that he "was glad that he did not represent any New York organization."

I have written this not because I am assisting the International Labor Defense in connection with this case, but because I honestly believe that the difficulties in which the nine Negroes involved in the Scottsboro cases find themselves are due to the fact that at their trials—the only time when their defense could be put in in its entirety and with its full weight—no one attempted to put in that defense. This I believe has seriously prejudiced their case.

New York, June 8

CAROL WEISS KING

A Twenty-five-Year World Plan

TO THE EDITOR OF THE NATION:

SIR: To students of the world situation in agriculture, industry, and employment I should like to propose for consideration the following outline of a program:

1. That all tax bodies, local, state, and national, which have or can gain authority to do so, shall levy a tax on property for the creation of stabilization reserves.

2. That the rate of tax for this purpose shall be fixed by the taxing body in ordinary times as a very small percentage of all other taxes levied by that body, with probably a sliding scale for increasing the rate as the indices of prosperity rise. In periods of depression this tax rate should disappear altogether and give way to a flow of reserves in the opposite direction.

3. That sums collected for the stabilization reserves be invested with a view not merely to security of principal and income, but also to the prevention of wide fluctuations in flow of goods, money, credits, and services.

4. That federal, State, and local tax bodies should cooperate in supporting and creating coordinated local, State, and federal advisory bodies of quasi-experts on the prevention of periods of depression and on the expenditure of reserves for alleviating and checking such periods.

5. That this general insurance of society as a whole against extremes of depression and unemployment be supplemented by and coordinated with plans for stimulating various industries, labor unions, trade associations, and insurance companies to develop scientifically controlled small, medium, and large-scale experiments in insuring individuals against the losses of such periods of disturbance.

6. That scientific students of this problem definitely announce to the public which looks to their leadership the abandonment of any search for a specific remedy for hard times, and declare that they (the experts) are committed to a policy of developing an experimental technique and quantitative control of the flow of goods, credits, and services.

In short, it is proposed that the problem of control of business cycles be treated as a great scientific project calling for a twenty-five-year plan for the whole modern economic and industrial world.

Ellensburg, Wash., June 1

SELDEN SMYSER

Reform and Land Prices

TO THE EDITOR OF THE NATION:

SIR: In your issue of June 3 you say:

A program of this sort, as Senator La Follette has pointed out, could and should provide for financial assistance to cities and States in extending direct relief, for an extensive public-works program, for workable farm-relief legislation, reduction of the tariff, increases in the income- and inheritance-tax rates to finance public construction and direct relief, and legislation to create a national economic council to assist in stabilizing industry and agriculture.

The Nation has so much that seems good even to a radical that it should not, I think, stop short of the conclusions from its own doctrines. The foregoing is at least practicable. But would not all these remedies result mainly and eventually in raising the prices of land? Are we not entitled to know how *The Nation* stands on this question?

New York, June 10

BOLTON HALL

[*The Nation* can see no reason whatever, either in theory or in history, for believing that all these remedies would "result mainly and eventually in raising the prices of land." To contend, for example, that the increase of income-tax rates to finance direct unemployment relief would result either "mainly" or "eventually" in raising the price of land appears to us absurd. It is true, of course, that many social reforms, in addition to their other results, do raise the rent and consequently the selling price of land, but we are wholly unable to accept the contention that the landlord is the sole ultimate economic beneficiary of social progress and improvement.—EDITOR THE NATION.]

Presidential English

TO THE EDITOR OF THE NATION:

SIR: In your editorial, Hoover and Our Army, in the issue of May 20, the excerpt you gave from Mr. Hoover's address before the International Chamber of Commerce should be sufficient to prove to even the most obstinate that the man we have at the head of affairs has neither the capacity to think, even on elementary subjects, nor the ability to express himself with the clarity of a ten-year-old schoolboy. The amazing thing to me is that, with a heavy cordon of secretaries around him, the following was allowed to pass:

Endeavor as we must in support of every proposal of international economic cooperation that is just to our respective peoples, yet we must recognize that reduction of this gigantic waste of competition in military establishments is in the ultimate of an importance transcendent over all other forms of such economic effort.

No Herb of Healing

By LESLIE NELSON JENNINGS

Dig me no root that, by the moon's arcane
Indulgence, is of sovereign power to lull
Asleep the prowling Basilisk of Pain.
There is no herb of healing can annul
This that does violence to a flesh apart
From the poor effigy in whom I dwell—
An inward bleeding closer to the heart,
Sullen and slow and irremediable.

This body and breath is not my charge, nor yours.
I pit a stabler strength against the shrewd
Antagonist who spurns our paltry cures:
We have an older issue to conclude.
Living or dying, I shall ask no grace . . .
Go, take your pity to another place.

The Itching Palm

"Gimme": Or How Politicians Get Rich. By Emanuel H. Lavine. The Vanguard Press. \$2.50.

UNTIL recent months it could be said truthfully that Chicago is better than its reputation and New York is worse. Chicago had a long head start in the race for stellar corruption honors because of those incomparable exhibits, Al Capone and Big Bill Thompson. Legs Diamond may be entertaining but he is a frail shadow compared to the Scarface, and Jimmy Walker never tried to bust King George on the snoot.

New York's reputation is changing now. The city's government has become a front-page national scandal on its own account. The newspapers of the hinterland gobble up the press-association dispatches about corruption in the metropolis and print them under great, gloating headlines. Tammany, as the next Presidential election may show, has returned to its former role of America's favorite political villain.

Mr. Lavine proves that the Tammany reputation is deserved. He piles the evidence high in a veritable cyclopedia of New York corruption. If the narrative has the telephonic manner of a police reporter—and Mr. Lavine has been a police reporter for twenty-five years—the style has the virtues of its defects. The spurts and jerks give life to the prose. Mr. Lavine makes no pretense to careful reflection or documentation. He hurls his facts like hand grenades and nearly all of them explode. He has packed as much rottenness into 298 pages of muckraking as I have ever seen anywhere, and as far as I have been able to check up, he tells the truth.

New York—the book is almost wholly about New York—emerges from this study as a city ruled by a shrewd and ruthless gang of political racketeers. The system of "fixing" extends from the patrolman on the beat to the Supreme Court judge, with the district leader as the pivotal figure in the hierarchy. If a lawyer wishes an appointment as judge he speaks to the district leader; if a gangster wishes acquittal he fixes it through a court clerk who is a henchman of a district leader; if a plain citizen seeks surcease from a parking ticket he joins the district leader's political club. Sometimes the district leader is paid in cash; sometimes he receives a "loan," as he did in

the notorious Ewald case; sometimes he is paid on the installment plan. A judge who failed to pay his district leader for receiving a fourteen-year term at \$25,000 a year would be, in the classic language of co-leader Annie Mathews, "a rotter." The quality of judges produced by this system is indicated by the number who have been officially accused or have resigned under fire in recent months—Bertini, Crater, Vitale, Ewald, Goodman, Mancuso, McQuade, Simpson, Vause, Norris, and Silberman. The penalty for judges who neglect to pay the last instalment of their appointment price is suggested by the mysterious death of Magistrate Andrew Macreary.

More than 90 per cent of New York's 138,000 employees come under civil-service regulations, but there are enough vacant niches in the higher realms of city life to provide for the important Tammany-McCooley-Flynn henchmen by appointment and election. A district leader is commonly made a commissioner at from \$10,000 to \$20,000—six machine commissioners and deputy commissioners now sit in high places of the Walker administration after refusing to waive immunity before a grand jury, although the only legal reason for this refusal is that testifying might incriminate them. Minor assistants to the district leaders are commonly made aldermen at \$5,000 a year for two hours a week, counting the lunch hour.

Mr. Lavine shows how this machine has brought corruption into the school system and condoned the outrages of the vice squad. Its upper ramifications include the big bankers who plundered the depositors of the Bank of United States, and the realtors who cheat the taxpayers of \$25,000,000 to \$30,000,000 a year through the land-condemnation racket. Whenever a wave of civic reform begins in New York, the big bounders of the law and commerce rush to obstruct a thorough investigation, and the press plays up the irrelevant pleasantries of the charming Jimmy. Samuel Untermyer, Frank P. Walsh, and George Gordon Battle laud John F. Curry as a hero for refusing to waive immunity before a grand jury!

Most of the evils described by Mr. Lavine can be traced back to the acquisitive morality of American capitalism, and the politicians' cry of "Gimme" is simply a variation of the practice of private profit in the world of business enterprise. But not all these evils can be traced to capitalism. England manages to have clean local government within capitalism, and so do most of the cities of the Continent. In the United States we have Cincinnati and Milwaukee. New York is rotten today largely because of the indifference of intelligent citizens to civic affairs. Until civic indifference becomes less fashionable, the Currys and the Walkers will continue to rule the world's greatest city—and books like Mr. Lavine's will be written every ten years.

PAUL BLANSHARD

Keynes on Money

A Treatise on Money. By John Maynard Keynes. Harcourt, Brace and Company. Two volumes. \$8.

IN these two volumes Mr. Keynes presents conclusive proof of Alfred Marshall's statement that "... money is the center around which economic science clusters ..." Although he has called his work "A Treatise on Money," the topics covered in it range from the functions of a "supernational bank" to the conditions under which workers will obtain the benefits of labor-saving machinery in the form of a higher standard of living.

Mr. Keynes's analysis opens with a classification of the various types of money. He shows that as types of money other than commodity money are introduced, such as notes

and bank deposits, some criteria for their management must be accepted. The conventional guide has been convertibility into gold at a fixed rate, but this method of management, Mr. Keynes holds, places too great an emphasis on gold and leads to instability of price levels; management, he maintains, should be directed chiefly toward the maintenance of the stability of the purchasing power of money. In seeking a definition of purchasing power, Mr. Keynes is led to a discussion of price indexes. He reminds us that all groups of prices do not move sympathetically, and that if they do, a time lag usually occurs. His own preference (at least in the theoretical chapters) is for an index of the cost of living.

Mr. Keynes does good service in pointing out the error of considering the "value of money" to be equivalent to the "objective mean variation of prices." This particular view assumes that by averaging price changes we arrive at something new, namely, variations in the value of money. The unsatisfactoriness of this approach is that it leads to a simple quantity theory. For on the assumption that value and quantity vary inversely, it would only be necessary to control the quantity to control the value. This theory does not distinguish clearly between the movements of various groups of prices, and, in fact, most writers who expound it usually come to the conclusion that it doesn't much matter which prices are included in the index so long as a sufficiently large number are taken.

Mr. Keynes does not rely on the quantity of money to explain the variations in its purchasing power. The main theme of his theory is that disequilibria in the rates of saving and investment cause changes in the prices of consumers' goods. At first this might appear confusing; for, one may ask, how in a modern society can one save without investing, short of hoarding? But the distinction is perfectly legitimate and clear as the author draws it. Saving is the negative act of refraining from consuming. It results from the individual's decision as to how much of his monetary income he will devote to consumption. Investment, on the other hand, is the result of enterprise, and is the positive act of directing economic goods and services into the form of capital goods.

It follows from this theory that "... the conditions for the equilibrium of the purchasing power of money require that the banking system should so regulate its rate of lending that the value of investment is equal to savings." Since the rate of investment depends on the rate of interest, the central bank should lower its rate of discount and make open-market purchases when the level of prices is falling, in order to encourage investment. This will tend to restore equilibrium between savings and investment and thus correct the disequilibrium which is causing the price decline. Such is the essence of the theory.

Examination shows that it rests on many doubtful beliefs regarding the causation and sequences of events. It is assumed that the central bank is able to control the market rates of interest through changes in its own rediscount rate and holdings of bills and securities. Certainly our Federal Reserve banks have not been able to do this at all times. Further, the guide to the policy of the central bank must be the condition of equilibrium between savings and investment, but Mr. Keynes himself points out that the rediscount rate has also the functions of protecting the gold reserve and regulating the quantity of credit.

These objectives are not always harmonious. The further transitions in the sequence of events require that the market rates of interest induce changes in the rates for long-term loans, and that these in turn alter the rate of investment. Finally, the change in the rate of investment must alter the prices of consumers' goods through changes in money incomes relative to the quantity of consumers' goods. The chain of events is too long and the links too weak. If the rate of investment is to be controlled, it would be more effective to regu-

late it directly. Recognition of this leads Mr. Keynes to suggest that this might be made a government function.

But this is not the end of the complications with which the theory is confronted. The international character of price movements must be considered. It follows that the complete national autonomy of any central bank is unlikely. Confronted with this difficulty, Mr. Keynes seeks a way out by proposing a "super-national bank." In seeking a criterion for its policy, he abandons the consumption index in favor of a wholesale-price index. This completely destroys the force of his theory and places him in the same position as those whom he has previously criticized.

In broadening his discussion to include credit-cycle theory, Mr. Keynes strays from the straight path of stable purchasing power to suggest that inflation might at times be beneficial. His approach goes through several modifications. At first he concludes that if inflation could be carefully engineered, lack of sufficient voluntary savings might be offset. However, deflation is not to be permitted to follow. Later in the discussion inflation is recommended as a corrective of a previous deflation. In the face of these proposals Mr. Keynes recommends in the second volume that a stable price level should be sought.

The "Treatise" is valuable in the emphasis which it places on factors other than the quantity of money and credit as influences on prices. The stress placed on the necessity for equilibrium between savings and investment is particularly important. Furthermore, the interrelations and complexity of the price structure are fully brought out. In attempting to establish the sequence of events essential to his theory, Mr. Keynes presents many thoughtful chapters on banking theory and policy. Several chapters are devoted to statistics, some primary and some secondary.

A chapter is devoted to historical cases, which concludes with a discussion of the present depression. Mr. Keynes attributes the slump of 1930 to the deterrent effects on investment of the high rates of interest which preceded it. Many would object to this on the ground that investment during the period preceding 1930 was going forward faster than savings. He does not discuss this possibility but on the other hand recommends that the disequilibrium be corrected by the Federal Reserve banks. They should make open-market purchases in such volume that the member banks would have more funds than they can lend at short term, thus forcing them into the securities market. This would lower the rates for long-term loans and thus encourage investment. In this manner equilibrium would be reestablished between savings and investment. As a matter of fact, all that has happened during the past year or so as a result of just such a policy is the establishment of ridiculously low rates of interest for some types of short-term loans. One is reminded by some of Mr. Keynes's theories of the remark made by W. Stanley Jevons many years ago: "There are men who spend their lives and fortunes in endeavoring to convince a dull world that poverty can be abolished by the issue of printed bits of paper. I know one gentleman who holds that exchequer bills are the panacea for the evils of humanity."

The early chapters of Volume I give promise of a well-knit theory of savings and investment. Unfortunately, Mr. Keynes does not fulfil these expectations. Perhaps he is too preoccupied with an attempt to find a simple solution for the immediate difficulties with which England is confronted as a result of the readjustment in world economic relations since the war. From the point of view of his theory, the chief of these is the Bank of England's loss of control over the international monetary situation. The result is that protection of its gold reserve demands a relatively high bank rate, while domestic conditions require a low one.

WILLIAM E. DUNKMAN

Why Write Fiction?

Life Among the Lowbrows. By Eleanor Rowland Wembridge. Houghton Mifflin Company. \$2.50.

AFTER one has finished Mrs. Wembridge's book, so sane, so just, so coolly kind, and at the same time so interesting, one is brought to the conclusion that the novelists who strive for realism with particular emphasis on what has been called the seamy side of life might just as well shut up shop and go home. These tales of girls who got into trouble with the law prove anew that truth effectively told is not only stranger but on the whole more absorbing than fiction.

"The characters in the following sketches," Mrs. Wembridge says, "were all dull people, and most of them were exasperating besides. All honor to the sober and kindly citizens whom Nature slighted when she made their minds, and yet who somehow muddle through. That these pages are largely devoted to those who muddled rather badly is only because, whatever their limitations, the sober and kindly rarely get arrested, and therefore I do not know them quite so well." With this disarming preface, we make our bow to the moronic, the neurotic, the irresponsible, the unsuccessful. We see them in their pitiful and unhappy struggles with living, at which they mostly fail, and with the law, which they mostly do not understand.

Mrs. Wembridge makes clear how absurd it is to expect them to cope with the exigencies of the world as they, in their incapacity and poverty, must inevitably meet it. When two of these waifs, united in holy matrimony and expected to live within their scant means of twenty dollars a week, come in contact with authority, an effort is made to make them see their own problems. Flora, the young wife, was asked: "If you have twenty dollars a week and spend fourteen a week, how long will it take you to save three hundred dollars?" The answer should be given in Mrs. Wembridge's own words:

Flora, who had a sense of humor, could not at first get past the joke that she should ever save anything. "A lifetime," she answered, "—and a long lifetime." Then, "three hundred times fourteen." "Three hundred times fourteen what?" we persisted, and Flora answered "dollars." The example was written out for her, but she had completely lost the connection, and when she was again reminded . . . she answered, as if through the telephone, "2025." What she meant by that we shall never know.

Not all of them are so inept about money. A young bride who won a three-hundred-dollar prize in an exhibition dance contest rushed into Mrs. Wembridge's office, waving her check. "I got the prize," she shouted, "Now Jim and I can have a baby." Nor are they all unaware of the problems that beset them, although their language to explain or describe them is so limited. They recognize that mothers are a problem—they work for you and you must help them all you can; and when you find your man you must leave them; and they are worrisome when they keep too desperate a curb on their daughters, and when they allow them too free a rein, when they too obviously prefer their sons, when they do not protest the brutality of a harassed and dimly understanding father. They know that sisters should not give up too much for their brothers; that "old maids" have their own particular difficulties. Fathers present a problem all their own. They "holler." What about?

"Oh, about everything. Someone has his paper, or the kids make a lotta noise, or he don't want us to go out nights, or he just hollers to hear himself." . . . Still another [girl] gave as her three dearest wishes to have a wrist watch, to play second base on the ball team, and to have her father "always mad."

"Always mad," we echoed in astonishment. "Don't you mean never mad?"

"No, mad all the time," she asserted with decision. "Because when he ain't mad, he just hollers. But when he's real mad, his neck swells up so he can't get a holler out, and I wish he'd stay swelled up!"

Out of all this welter of humor and pathos, ignorance and a certain native shrewdness, Mrs. Wembridge is able to draw few conclusions. She can only predict that the unpredictable will happen. Pauline is insistent that she disposes of her person for pay only when she needs the money, for herself or for her numerous relatives. Nina insists on the exact contrary. "Do you think I take money for it?" she demands in indignation. . . . "When I go wild I go for fun, and because I want to. I would never be so low as to take a cent if I starved for it. . . . What jazzing round I do, I do for nothing." But if their morals and their manners, not to mention their behavior, are unpredictable, there is one ground on which they can be met. In a chapter called *Victoria Knew Her Morons*, Mrs. Wembridge declares that when all appeals have failed or are obviously meaningless, when justice and decency and honor are empty words, there remains respectability, the snob appeal. "Do you think Mrs. Governor Soandso would do that sort of thing?" the culprit is asked. And a hung head and tears are often enough the answer. Authority, unjustified and unexplained, is the only thing that these young persons understand. "You mustn't do it because it isn't done." Conventionality, hypocrisy, cant, anti-feminism, and sex-repression—one of them has often been found to work in the social redemption of one of these unfit when more modern and individual appeals failed. For in the last analysis what they lack is mind; not will, or experience, or energy, but ordinary, fourteen-year-old intelligence. They are not mentally equipped to meet the world.

Mrs. Wembridge does not know what to do with them in general. She can only describe them. And that she does supremely well.

DOROTHY VAN DOREN

A Great Railway Builder

Henry Villard and the Railways of the Northwest. By James Blaine Hedges. Yale University Press. \$3.

THE name of Henry Villard is inseparably connected with the history of transcontinental railway development in the Northwest, and Professor Hedges gives in this book a fully documented account, notably clear in view of the complexities of the subject, of Villard's connection with the transportation undertakings in which he was for years a commanding figure. The story begins with 1873 when Villard, who was visiting in Germany after nineteen years' of romantic experience in the United States, was sent back as agent of a committee of German holders of bonds of the Oregon and California Railroad on which interest was in default. Investigation convinced him that some of the European investments were safe, and his own career of railway promotion and construction was before long under way.

The key to the twenty-year struggle in which Villard engaged is found in the fact that the Columbia River gateway and Puget Sound "offered alluring opportunities to competing railroad builders who sought to center the trade of the region at one port or the other." Villard made Portland the center of the network of rail and water lines which he eventually controlled, and added the Northern Pacific to his other interests, completing it to Portland only when it decided to build to the Sound. A later Northern Pacific management actually built the competing line, whereupon Villard arranged an alliance between the Union Pacific and the Oregon and Transcontinental

which gave an independent connection with Portland. In 1884 he resigned the presidency of the Northern Pacific, and when he again entered the field as a railway power a deadly competition had replaced the monopoly which had seemed to him the best solution of the railway problem. Although he was not at that time directly connected with either of the competing systems, he was the agent of German investors, and it is Professor Hedges's opinion that "probably no railway promoter in the Pacific Northwest ever strove so earnestly for the good of all" as did Villard when, from 1887 to 1889, he sought for harmony and fair competition through the device of a joint lease.

The good fortune of success, however, was not to be his. Both the Union and Northern Pacific went down under the weight of millions expended in the premature construction of branches, and Portland, which had accounted Villard as its greatest benefactor, was alienated. Professor Hedges is chary of personal judgments, but his book nevertheless makes clear the high-mindedness of Villard's large plans and the skill and courage with which he prosecuted them until a too powerful opposition, political, railway, and financial, overwhelmed both him and them.

WILLIAM MACDONALD

French Revolutionists

After Robespierre: The Thermidorean Reaction. By Albert Mathiez. Alfred A. Knopf. \$5.

A Biographical History of the French Revolution. By J. Mills Whitham. The Viking Press. \$5.

WITH the appearance of M. Mathiez's new volume in a very adequate English translation, his readers on this side of the Atlantic have an opportunity to see what he makes of the period that followed the death of his hero. His method, as always, is that of the "scientific historian"; his temper, as of old, that of the prophet who summons the heavens to fall upon the corrupt set of schemers who turned upon Robespierre and prevented the establishment of his Republic of Virtue. Anyone with a minimum of historical training can use Mathiez as a model to prove that the objective historian, controlled by rigorously scientific laws, does not exist. Bias and partisanship fairly ooze out of his impartial presentation of facts. But it is a persuasive bias, a vigorous and erudite partisanship, a prejudice nourished by a lifetime of the most productive and the most illuminating scholarship of our generation. Partisanship, that is, disbelieving in the prejudices of someone else, and bias, that is, strong convictions of your own, are the very essence of the matter when you deal with fundamentals; and what could be more fundamental than the concepts underlying the organization of a new social order?

Mathiez's account is unquestionably the most penetrating study yet written of internal politics in France during the fifteen-month period that followed the fall of Robespierre on the 9th of Thermidor. He shows us a France ruled by trimmers, by repentant Terrorists, by unscrupulous politicians whose highest conviction was self-preservation; who undid the institutions of the Terror Government which they helped establish, who reopened the churches without believing in the church, who recalled the Girondins whom they had persecuted, who gave an amnesty to the royalists in the Vendée, and who fell, like avenging furies, upon their former colleagues who were not adroit enough to show that Robespierre was responsible for their own acts of violence. It is a terrific indictment that he has drawn, a sordid picture of the decomposition of representative government. But his study is not complete enough. We should like an appreciation of the sincere and uncalculating popular desire to return to middle-class normality after the

sadistic rule of revolutionary idealists. We should like also more recognition of the fact that even though the morally bankrupt conquerors of Robespierre dammed the waters of pure—and homicidal—revolutionary idealism, they still performed an indispensable service in preserving the republic and the major achievements of the revolution.

Mr. Whitham is a novelist turned explorer, a fisher of souls, who traces the course of the revolution by conducting "psychological inquiries" in an effort to discover how each of the outstanding figures of the period "fulfilled his destiny and helped to determine his own fate." To give continuity to his inquiries he has interpolated several brief chapters which give the historical background. There is a reassuring solidity about his vignettes, abundant evidence that he has read widely and made his way patiently through conflicting interpretations to his own conclusions. Old wine in new bottles, perhaps; but old wine that was safely locked in the musty cellars of still mustier specialists. Mr. Whitham's volume repeals the prohibition law and allows the profane reader to drink of the choicer and older vintages. It is a thoughtful book and an informative one, enriched by the author's sympathy and humanity. It deserves many readers, for Mr. Whitham writes vividly and entertainingly. At times he overreaches himself in a curious, apocalyptic style that makes one reader yearn for Strachey's tempered urbanity. But the flamboyant patches, luckily, are rare. American readers, nurtured on Carlyle and Mrs. Nesta Webster, would do well to turn to this volume for a truer appreciation of men and events in the French Revolution.

LEO GERSHOY

The Black Man's Burden

Caliban in Africa. By Leonard Barnes. J. B. Lippincott Company. \$3.

IT'S only about 50,000 words. The subtitle is "An Impression of Color Madness." It deals with the sadism and social degeneration of race hatred. The victim is the African. The patient is the Afrikaner, the white South African of remote and culturally almost severed Dutch ancestry, together with the Britisher who is assimilated to his color craze. If we are to believe the author, such Britishers are few and queer.

Just a word about the author's credibility. His diagnosis and indictment are moved by the same admirable social passion which illumined the works of E. D. Morel and Roger Casement. The only flaw is that Mr. Barnes is so excruciatingly British. He is a congenital proconsul of empire. He is British first and decent afterwards. He would have you know that if Caliban were not predominantly Boer but Anglo-Saxon, he wouldn't be Caliban but Caesar. Hence, for all his choice intelligence Mr. Barnes puts down black on white: "The *Pax Britannica* is the most powerful influence for social good since the *Pax Romana*," especially for the colored races, "who look to the British crown, and the British crown alone, for sympathy, support, and leading in their struggle toward self-development." Yet Mr. Barnes's Anglophilia makes not the slightest difference here, for his charge is incontrovertible. He crosses himself whenever the ikon of the British "crown" flashes into his imperially religious mind—but he tells the truth about South Africa.

And he knows how to tell it. For one thing, he writes with a concentrated perspicacity which might have been easily bloated into several volumes. But he has chosen to compress it all into an essay of distilled criticism, into a pamphlet. "Caliban in Africa" is a pamphlet in the great tradition. It is explicitly a charge, but implicitly a monograph as well. Mr.

Barnes has not failed to draft the necessary scholarship for his propaganda with which to paralyze any possible vindication by those whom he attacks. He has the pamphleteer's ultimate skill of isolating his victim from any appeal to human conscience. And yet he does not leave him to the tender mercies of our unctuous hates. He lifts white South Africa to that abiding sense of pity in each of us which makes us wonder with a touch of morbid tragedy at beasts in human shape. The Boer, we feel, belongs to those eternal children of the race who "know not what they do."

Then, Mr. Barnes, who is a trained journalist, has a style peculiarly fit for publicism. It is farthest away from excited prattle or empty indignation. It is ironic but not cynical. It is effectively but impersonally malicious. It is simple for the ordinary, yet sophisticated for the more expert reader. It combines swift and sure, as against hasty, timeliness, closely fitting the social politics it handles, with an aura of dealing with the verities of human folly. Under Barnes the Afrikaner really changes into Caliban. The poor race-crazed lout is dignified into the perennial brutality of man to man. He emerges as a sort of degraded and looney version of an Old Testament figure. Indeed, writes Mr. Barnes, the Old Testament, those inspired prolegomena of racial megalomania, is the Afrikaner's primer.

But style alone is not enough. Mr. Barnes's main strength as a critical journalist is his method. It is a blend of three procedures. First, and throughout the book, there is running psychological analysis of South African interracial mentality. He describes this psychic degradation from various angles, as it affects both whites and blacks and their social crazy-quilt. The madness consists mainly in the Afrikaner's almost total social preoccupation with racial hate and fear to the gradual evanescence of his other significant social problems, so that the national spirit, the culture itself, becomes a sort of glorified psychosis. Secondly, Mr. Barnes carries his psychological description of this South African sociality to its logical, or rather sociological, conclusions. He argues and points its inevitable consequences. He shifts the monograph into a pamphlet by showing just how these racial obsessions work socially, in terms of legislation, in policy, in persecution, in injustice, in the social illogicalness and immorality which kill the higher and fertilize the lowest social faculties. And, thirdly, he proves both his psychological description and his sociological indictment of Caliban by an extraordinarily judicious and strategic mastery of facts. His facts are comparatively few and far between. But they are so shrewdly tactical, they guide his view so perfectly, partly because they are taken from the mouths and statutes of Afrikaner statesmen, because they are made and admitted by the dominant forces of Boer society, but mainly because each fact calls for no further context. It is like reading the main facts about Jack the Ripper. We may wish to know a great deal more about him to understand him better, but not in order to see his side. And so we may wish to know a great deal more about the South African race problem, but we can never think differently of the Boer unless his social outlook miraculously changes. And the miracle, Mr. Barnes assures us, cannot happen.

Mr. Barnes quotes some well-known Afrikaner statesmen on the race problem. "No ethical consideration, such as the rights of man, will be allowed to stand in the way" of dealing with the black man, says one. "The dominant thing," says another, "has not been justice at all. . . . If we want to hold our own, we must exterminate the native." The great "liberal," General Smuts, is, if anything, more offensive for his unpleasant unctuousness. The social legislation against the Negro is really a legalized ramification of the third degree. And the social atmosphere is one of chronic *Schrecklichkeit*, a terror of conventions. Besides, the whole social structure be-

IDEAL
MARRIAGE

ITS PHYSIOLOGY
AND
TECHNIQUE

by

Th. H. Van de Velde,
M. D.

Formerly Director of the Gynecological
Clinic of Haarlem. Translated by Stella
Browne. Introduction by J. Johnston
Abraham. With Eight Plates in Colors.

352 pages • \$7.50

A sober, scientific, and complete book on the sexual relationship, in which will be found all the data bearing upon its physiology and technique. Written by one of the foremost gynecologists in the world, it should be in the library of every well-informed educator and social worker.

LIST OF CONTENTS

PART I

Introduction and General Physiology of Sex

CHAPTER I—Marriage, Actual and Ideal

CHAPTERS II and III—The General Human Physiology of Sex. The Evolution of the Sexual Impulse. Sexual Sensations and Internal Stimuli—Sexual Sensations and External Stimuli.

PART II

Specific Anatomy and Physiology of Sex

CHAPTERS IV, V, and VI—The Sexual Physiology of the Adult Woman. Introduction and Definition. The External Genital Organs. The Internal Genital Organs.

Ovarian Activity, Rhythm of Vital Manifestations in the Female Organism, and Menstruation.

CHAPTER VII—Anatomy and Physiology of the Male Sexual Organs

PART III

Sexual Intercourse
Its Physiology and Technique
CHAPTER VIII—Definitions, Pre-
lude, and Love-Play.

CHAPTERS IX, X, and XI—Sexual Union (Communion). Physiology and Technique. Position and Action During Coitus.

CHAPTER XII—Further Manifestations During Coitus: Epilogue or After-Glow.

PART IV

Hygiene of Ideal Marriage
CHAPTERS XIII, XIV, XV, and XVI—Bodily Hygiene. First Intercourse or Defloration—Honeymoon
Influence of the Sexual Function on Physique and Psyche—Sexual Vigour or Potency.

Personal and External Factors Affecting Sexual Intercourse.

Sexual Intercourse in Special Bodily (or physical) Circumstances. Sexual Intercourse during Menstruation.

Care and Cleanliness of the Organs of Copulation.

CHAPTER XVII—Psychic, Emotional and Mental Hygiene.

The sale of this book, because of its scientific character, is positively restricted to physicians, social workers, lawyers, ministers, and educators. Please state qualifications in ordering.

Qualification _____ (N2)

comes increasingly irrational, and makes no sense in its growing hopelessness. The native, whose person and society are peculiarly bound up with the land, is being constantly legislated and wedged into smaller, less productive, wilder reservations, into a variety of wilderness stockades. He has no right to purchase land. "He is the victim of a common swindle," of statutory dispossession for white privilege. Even on the reservations the social patterns of the Negro are constantly torn up. Hundreds of thousands of black men are squeezed out from the land entirely. And so the Afrikander is beginning to legislate against their presence in industrial centers. Thus an ever-larger number of blacks are literally illegal entities, for they have no place to go in their own country. In fact, the legal color bar in South Africa, as the color bar everywhere else, is the juridical absurdity of making life itself a contraband. The Afrikander is much perturbed by the industrial ignorance of the Negro, yet he legally enforces this ignorance by limiting black educational opportunities to practically nothing. The whole system is based on securing the total insecurity of the native in order to exploit him. And the result is that the South African Negro is not merely a proletarian, but what the Germans call a *Lumpenproletarier*, not merely abysmally poor but degradedly so, a pauper without rights, disinherited and terrorized. Social politics in South Africa is the politics of fear. It is crazy. "The Afrikander," says Mr. Barnes, "is, in simple truth, a . . . monomaniac."

The Boer can do no wrong. The native has no rights. And there is no hope. There must be an explosion. "Even if a changed intention suddenly flashed into the Afrikander mind, it could not . . . avert collision. South Africa must now proceed straight to disaster by mere force of inertia." Her sinister and tragic lesson to Jim Crow America should be rather obvious.

BENJAMIN STOLBERG

Books in Brief

Noguchi. By Gustav Eckstein. Harper and Brothers. \$5.

The poverty of his home, the example of his mother, a heroic peasant woman who lived with dignity and without help the common, inexorable epic of a hard life, and an accident with fire that left him with a deformed hand and the cripple's necessity to win a compensating distinction—these were the factors that developed the native endurance, intelligence, and energies of Yone Noguchi to greatness. His career is a stirring one, a remarkable record of achievement from the days when he paid for medical care with nurse-boy services, through his work in syphilis, paresis, spotted fever, and other germ diseases, to his death in Africa, a martyr in the fight against yellow fever. Like many great scientists he was the artist type; he made up for long spells of inattention and neglect with titanic orgies of activity, and when in the midst of his work was often able to go without sleep for weeks. He was daring, imaginative, and devoted. To this account of his life his biographer has brought a scientist's comprehension of his work, a good writer's innate psychological understanding, and a spirited style.

Green Hell. By Julian Duguid. The Century Company. \$4.

The book is as melodramatic as its title. It is the record of adventures in the South American jungle that is no respecter of frontiers and covers large parts of Bolivia, Argentina, Paraguay, and Brazil. Though the adventures are exciting enough, the author does his best to intensify them with literary devices, spreading over "Green Hell" an added coat of livid green rhetoric. The paint, however, to the reader sensitive to uses of rhetoric, is not of a high grade, and is applied with a house-painter's technique.

Valencia. By Leon Tahcheechee. Coward-McCann. \$2.50.

Leon Tahcheechee's first novel is a tale of odd characters and the odd happenings that shaped the devious patterns of their lives. The setting is that of the Spanish city of Valencia. The characters, except for the protagonist, who is an American, are Spaniards and gypsies. The episodes are picaresque: fortune-telling with the Tarot pack, business ventures that never emerge from the dream stage, diverse love affairs, a fantastic duel, an even more fantastic trial for parricide, and adventures that culminate in the "learnedly obscene pantomime" of the gipsy marriage dance, which is wasted upon a reluctant and over-fastidious American. Mr. Tahcheechee handles his material well. He knows how to set his palette for southern Spain, and he does not load his brush too heavily. His gypsies and his amiably grotesque aristocrats have the color and air of authenticity. The fact that he is a painter as well as a writer makes him a keen observer of the visible world and gives his descriptions an unusual sensitiveness and exactness. Mr. Tahcheechee has distinct narrative gifts, a prose manner which is unmistakably his own, and a deft way of modeling characters. His creation of the character of El Conde de Jenor is an achievement; indeed, it is the real achievement of the book, and one which puts "Valencia" high among the first novels of the season.

The Weigher of Souls. By André Maurois. Translated by Hamish Miles. D. Appleton and Company. \$2.

The efforts of a doctor to capture the immortal energies given off at death form the thin body of this story by the well-known French biographer and novelist. Curiously enough, the events have a strange warmth, and the defeats and successes of the doctor's efforts, with their final pathetic denouement, are, if not exactly exciting, at least never dull. Though the conception is fantastic, the author has managed to make it glow with the light of possibility and the warmth of human emotions.

Zuñi Folk Tales. By Franklin Hamilton Cushing. Alfred A. Knopf. \$5.

"Zuñi Folk Tales" has long been an appreciated book, much sought and hard to secure, with libraries and individuals everywhere on the lookout for a copy. The eagerness of the quest is fair indication of the merit of the work, for Cushing is one of three or four writers sufficiently endowed to give us translations of American Indian tales that are true to their native quality and in our own tongue are literature. Actually the tales are something more than folk-tales in any ordinary sense; they are reflections of the complexion of mind of one of the most interesting people in the world, giving such pictures of the *mores* of a folk as the reasoned investigations of the sociologist might never discover, and—because Cushing was a genius—going beyond the sociological into the philosophical and aesthetic understanding of that nature which expresses itself in *mores* and creates the folk. In this respect Cushing's work is a contribution to far more than any mere interest of curiosity or pastime; it is a lasting part of our American heritage, definitively among our "classics." These facts make obvious the value of a new and beautifully printed edition of the "Zuñi Folk Tales," including Major Powell's Foreword, and with an added introduction by Mary Austin.

There Will Be Fighting. By Peadar O'Donnell. G. P. Putnam's Sons. \$2.50.

Here is a swiftly moving story of insurrections and intrigues among Irish patriots and renegades in 1921, involving characters whose humanness and aliveness, even whose quaintness, are admirable and enjoyable. It is unfortunate that the jacket gives away the outcome of this exciting, though formalized, adventure story.

New Nationalism in the Philippines

By ANDRES V. CASTILLO

IMMEDIATELY after his return from his trip to the United States in the interest of Philippine independence, Manuel Roxas, Speaker of the Philippine legislature, announced plans for a new nationalistic movement. The central idea of this movement, popularly known as Ang Bagong Katipunan, is, as the Speaker puts it, "to take the course that we should take were we independent." The aims of the Bagong Katipunan as embodied in its decalogue are the inculcation of a belief in national destiny; the attainment of national unity, economic nationalism, racial equality; the husbanding of human resources; veneration for the past; the fostering of national culture, national discipline, honest government, and idealism. In short, it is an attempt to work out thoroughly and peacefully the whole Philippine problem.

The Bagong Katipunan does not advocate violence to carry out its aims. It is not revolutionary or "boxer" in character. It is entirely free from the taint of communism. It has no party affiliations, nor has it any political purposes to serve. It is non-sectarian and is national in scope.

The organization has caught the popular imagination, and people from all walks of life and of all political and religious beliefs are rallying to its support. Membership is open to all Filipino citizens. It requires from every member a yearly fee of one peso (fifty cents), and, what is far more important, it expects all its members to practice the tenets of the organization in their daily life. There are junior chapters to reach the young people, especially students in the public schools, and chapters for women, who try to give effect to the humane side of the movement in the home. In the first week after the movement was formally launched on November 30 last, it received more than 20,000 pesos as fees besides donations of all sorts, and it even has the sympathy and cooperation of the foreign community. A number of American residents signified their intention of becoming members, but their applications were respectfully rejected because only Filipinos could be admitted. The organization has found support not only in the city of Manila and other centers; the provinces too have registered their unqualified cooperation, and the provincial governors have been organizing chapters in their respective districts.

Perhaps the greatest inspiration to the launching of the Bagong Katipunan was the conception, widely prevalent among Americans, that the Filipinos do not really want independence, and that they have not demonstrated by deeds their willingness to shoulder the responsibilities of a truly independent existence. This accusation the Bagong Katipunan attempts to challenge vigorously. The Filipino nationalist leaders have finally come to the conclusion that the struggle for independence must be fought and won or lost in the Philippines. They propose to fight and win it by means of economic nationalism. Article III of the decalogue of the Bagong Katipunan states:

We believe that our country is the inalienable patrimony of our people. We shall conserve and develop our lands, mines, water power, and other resources, and shall

insist that their control be forever kept in the hands of our people. We shall practice economic nationalism. We shall produce and organize for economic self-sufficiency. We shall produce what we need and buy what we produce. We shall encourage the restoration of our former household industries. We shall patronize our countrymen who are engaged in business but condemn those who exploit their customers. We shall buy from abroad only those commodities which we cannot produce.

The doctrine of absolute non-intercourse with other nations is not advocated, ■ the careless observer might conclude. In international trade, of course, one has to buy in order to sell. None of the economic doctrines advocated by the Bagong Katipunan come into conflict with this economic truism; most of them aim to realize it more fully. By the encouragement of home industries more people will find employment and their purchasing power will be increased. Consequently production will be accelerated to meet the increased demand for commodities, and the cost of production of goods for native consumption as well as for export will be lowered by the economy of large-scale production. The nations which demand Philippine products will thus benefit by the lower price, while the Filipinos will demand more goods of the luxury type mainly supplied from abroad, thus enabling foreign nations to trade more extensively with them.

A cursory review of the economic history of the Philippines during both the Spanish and American administrations recalls the efforts of the Filipinos to bring into fruition the rich natural resources of the islands. The more benevolent and farsighted of the Spanish governors encouraged the development of native industries, which decayed or were neglected under less competent and more grasping men. The Bagong Katipunan attempts to resuscitate these forgotten and neglected industries, which were once the mainstay of the islands and one of the most important reasons for the reluctance of Spain to surrender them. It has been pointed out that the domestic system of home industries conducted without elaborate machinery cannot survive the competition of the outside world, but the supporters of the movement assert, with strong backing of facts, that there are native industries that can be developed without the aid of machinery so as to sell their products at reasonably low prices.

Under American administration the Philippines fare no better than they did under Spanish, in spite of the supposed advantages conferred by the free-trade relations between the two countries, first established in a limited way in 1909 and finally in 1913. The benefits of free trade cannot be denied but they have been exaggerated. Free trade has brought the Philippines into a state of economic dependence upon the United States. It has given birth to industries, the most notable example being the sugar industry, which depend for their existence upon the continuance of this paternalistic arrangement. These artificially nourished industries, enjoying a special market, can last only as long as their special privi-

PANACEAS

ALMOST every one you meet has a different explanation for the depression, a different remedy. The panacea market is glutted. Yet you feel there is still room for the truth, for the plan that will really get results. That, at least, was how we felt before talking with George H. Hull. Afterwards, the more we thought about it the more strongly we felt that his explanation and his plan were the truth, or as near it as a mere human can be expected to come.

Others have spoken vaguely of psychology, boom and depression, of the neglect of economic laws, of the need for organization and planning for the future. Mr. Hull speaks plainly of one specific origin of depressions, of the need for a specific organization in one specific key industry, of a specific new form of profit distribution—simple and possible of achievement—which would solve the problem of consumption, which is no more than the problem of buying power at this time, and which would pool the interests of Capital and Labor. His plan is something to get your teeth into, something that every one should have the chance to think about—and act upon. He calls it *Collective Capitalism*, and it appears in the July

NATION—JULY

leges continue. The present tariff arrangement is only a temporary makeshift. As a matter of fact, the past few years have witnessed numerous attempts in Congress to undo it, the success of which would also mean the undoing of the industries favored by the present free-trade relations. Many bills in one form or another have been introduced into Congress seeking to limit duty-free Philippine sugar to 500,000 tons a year. The dairy industry of America has conducted on numerous occasions a vigorous campaign against the entrance of copra and cocoanut oil into the American market free of duty. As a practical answer to these threats, the Bagong Katipunan tries to discourage industries dependent on free trade with the United States, and takes the initiative in establishing and strengthening industries that can compete in the world market. With the present tariff arrangement the Philippines are entirely powerless to develop their economic life to meet world competition. Even against the competition of foreign goods other than American, it is extremely difficult for the islands to gain protection. The Bagong Katipunan seeks to protect the native producer and merchant not by means of a tariff, but by a nation-wide campaign to induce the people to patronize them instead of the foreigner. America is ready to teach the Filipinos all the doctrines of economics except that of protection, of which she is the most ardent exponent in the world.

The consequences of this social-economic-political movement should be far-reaching. It enjoys and will continue to enjoy public favor and following because it appeals not only to the inherent love of liberty in mankind, but also to the natural desire for a more prosperous and wholesome life. The new nationalistic movement serves notice that a peaceful and orderly economic revolution which seeks to avoid the mistakes of older and more advanced countries has already begun in the Philippines.

WHAT CAUSED MR. HOOVER to change front suddenly on debts and reparations? As we have stated elsewhere we do not know, but a letter from Berlin from a most distinguished economist throws some light upon the matter. It is addressed to the editor of *The Nation* under date of June 18, and runs as follows:

Conditions in Germany have become catastrophic to a degree that not you, my English friends, nor I could in the slightest degree have forecast when you were still here. Germany's convalescence or her collapse into economic chaos depends now upon whether it will be possible to achieve free trade, or at the very least the removal of the most important tariffs on raw materials, in the face of the desperate and diabolically clever resistance of the heavy industrialists on the Rhine and in the Ruhr, and the great agriculturists in our eastern provinces. Only in this way will it be possible to bring about a reduction of prices and, through the reduction of prices of raw materials, a decrease in the tremendous unemployment. In all the Berlin central banks, and in the center of the government itself, the barometer points to storm. One must expect the worst every day, for Brüning's latest emergency decrees, with their dreadful effects upon the widest groups in our population, are bringing about the radicalization of the remaining sober elements in our communities at an incredible speed. The economists of the world have a great responsibility. They must in this last hour fight with all the means that they can possibly lay hands upon.

ON JUNE 28 the people of Spain confirmed the action of the April revolutionists in overthrowing the monarchy by electing a parliament that will be overwhelmingly republican. Thus, in a sense, former King Alfonso has had an answer to his appeal to the people to vote him back into power. In his decree of abdication he announced: "I am waiting to learn the real expression of the collective opinion of my people . . . and am only suspending the exercise of the royal power." However, very few candidates openly in favor of a restoration entered the election lists, and in consequence the voters actually were called upon to choose between moderate and extreme republicanism. The moderates making up the present Socialist-Republican Coalition Government won a majority of the seats, and there is every reason to believe that this group will now carry forward its very sensible program of reform. It must nevertheless be noted that as the moderate group inclines to the left rather than to the right, there is little probability of any compromise with Rome on the church question, or with the former ruling class on the question of its retaining or regaining any of its ancient privileges. Only one major problem was aggravated instead of simplified by the elections, and that has to do with the separatist movement in Catalonia. The separatist candidates won heavily against those who wished to see a strongly centralized government established in Madrid. The Socialist-Republican coalition is opposed to autonomy for Catalonia, but it will now probably have to modify its position lest suppression of the separatist movement lead to an upheaval that would have drastic consequences.

UNDER THE PRESSURE of economic necessity Europe is moving toward lower tariffs. Germany and Rumania are the latest countries to enter into an arrangement for the reciprocal reduction of import duties. By the terms of the trade agreement recently concluded Germany will lower from 50 to 60 per cent the duty on grains brought in from Rumania, while the latter country has agreed to reduce the rates on certain industrial products, especially heavy machinery, imported from all countries with which Rumania enjoys most-favored-nation relations. The Rumanian tariff decrease is expected primarily to benefit German manufacturers inasmuch as Germany is the chief source of machinery imported into the Balkan countries. The German-Rumanian agreement is the more remarkable because it was arrived at in the face of a difficult political situation. Rumania's membership in the Little Entente and its close alliance with France have tended to discourage any dealings of an economic nature with Germany. Indeed, only a few weeks ago Foreign Minister Ghika almost disrupted the negotiations between Bucharest and Berlin by refusing to permit the German delegation, which was already en route, to come to Bucharest, merely because the foreign ministers of the Little Entente happened to be conferring there at the time. But Rumania's need for disposing of its surplus grain and the increasing pressure upon Germany to find markets for its manufactured wares ultimately overcame all political obstacles.

LO, THE POOR FARM BOARD! Importuned by that great statesman Senator Jim Watson and other champions of the farmer to withhold its 200,000,000 bushels of 1930 wheat so that it will not compete with the 1931 crop, on June 26 it said a sorrowful nay to the farmer and reaffirmed its oft-expressed intention of selling whenever it could do so with a minimum of price disturbance. Next day the President issued a statement disclaiming any authority, of course, to determine the policies of the board, but suggesting "that he thought it wise to consider a more definite policy in respect to sales" of the board's wheat holdings, though some people thought the old policy quite definite, even if amazing. The board officials were reported as being "surprised," and next day came intimations that the board in limiting its offerings to foreigners and millers would compete as little as possible with righteous 1931 wheat. On the day following, Chairman Stone announced with spirit that "this is an independent board under the law, and not subject to interference from the President or anyone else." It is a great job being one of these independent organizations that Mr. Hoover sets up, only it requires flexible minds on the part of appointees. The board ought to hire an economic picture-puzzle publicity expert to explain, for the benefit of the President's candidacy in 1932, how it is going to sell 200,000,000 bushels of wheat without affecting prices, or, alternatively, how it is going to store them without incurring storage charges of \$36,000,000 a year.

PAUPER LABOR AND CHILD LABOR are keeping the sugar bowls of America filled. In the beet fields of Colorado, for example, whole families get out and work under the blazing summer sun for wages that are not sufficient to meet the more essential needs of a single person. The wretched working conditions in these fields, and the pitifully small pay, have been made the subject of a special study by the Mexican Welfare Committee of the Colorado Knights of Columbus. As a result of this study Thomas F. Mahony, chairman of the committee, reported to the Third Catholic Conference on Industrial Problems, which met recently in Denver, that the sugar companies have been "resorting to the family system of contract labor" to provide enough workers to raise and harvest the beets. Under this system, the report continues, "the sugar industry is able to escape responsibility and blame for the wholesale evasion" of the school-attendance and child-labor laws. More than that, the committee found that "the average wage per person was \$108 per year," and that even the present rate of pay was being cut without the notice the law requires. This should be comforting news to the Washington Administration, which has outwardly been so anxious to maintain wage rates. Obviously, as the report pointed out, "no family can exist" on such pay, and so "public and private charity agencies must be prepared to carry an increased burden this winter for the relief of this underpaid labor, thus subsidizing the sugar industry." And yet we are told that under the American system these poor unfortunates ought to see themselves through their difficulties.

DOES SECTION 13—the anti-monopoly section—of the 1927 radio law apply to the Radio Corporation of America? Apparently not, for otherwise the federal Radio Commission would most certainly have refused to

renew the broadcasting licenses held by that company. Instead, the commission decided, in face of the Supreme Court's recent decision holding the Radio Corporation and its affiliated interests to have violated the Clayton Anti-Trust Act, that RCA was entitled to retain its licenses. However, Section 13 clearly states that licenses must be denied anyone "finally adjudged guilty by a federal court of unlawfully monopolizing or attempting unlawfully to monopolize, after this act takes effect, radio communication, *directly or indirectly*, through the control of the manufacture or sale of radio apparatus, through exclusive traffic arrangements, or by any other means." In its decision of April 27 the Supreme Court did finally adjudge the Radio Corporation and its affiliated interests guilty of having exercised monopoly control over the manufacture and sale of radio apparatus. But three of the five commissioners decided that this had nothing to do with radio communication, even indirectly! Such fine logic-chopping may save the RCA for the time being, but the wind seems to be blowing in the other direction. First there was the April 27 decision; then on May 25 the Supreme Court held invalid the important Langmuir high-vacuum-tube patent, which has been described as "in large measure the foundation upon which the radio trust was built," and finally the Radio Commission was closely divided, three to two, on the question of renewing the RCA licenses.

WHILE THE DISMISSAL of Professor Herbert A. Miller from Ohio State University has received wide publicity throughout the country, the release of Dean Carl C. Taylor of the graduate school of North Carolina State College at Raleigh has been given almost **no attention outside the State**. Dr. Taylor, a man of strong character and high reputation, has been a member of the faculty of the North Carolina institution for eleven years and dean of the graduate school since 1923. He has long had differences with President E. C. Brooks, head of the college. According to the Greensboro *Daily News*, at about the beginning of June Dr. Taylor learned that he was under attack, and on June 8 the graduate school was abolished by the board of trustees as a measure of "economy"; so Dr. Taylor will be out of a job on October 1. According to Dr. Clarence Poe, who fought Dr. Taylor's battle in the board of trustees, the real issue was not economy or friction with the president, but

... the fight which some elements over the State have been making against Dr. Taylor in the matter of free speech. He is not a Communist, anarchist, or Socialist, as some are charging. . . . But suppose he were as radical as some are charging. I believe our colleges are in ten times more danger from professors who are afraid to tell the truth, from men who are too much afraid for their jobs to speak out about matters of public welfare, than they are from having professors go to the other extreme. Our colleges had better risk some radicalism than develop faculties noted for timidity and intellectual dry rot.

This is eminent good sense, and no institution can afford the injury to its reputation involved in ousting a man of Dr. Taylor's fine character and high standing.

ON JULY 11 George W. Norris, United States Senator from Nebraska, celebrates his seventieth birthday. To him go our warmest congratulations, our unceasing gratitude for his superb public service in both houses of Congress, and

the earnest hope that many more years of public activity lie before him, as many as those of our great Supreme Court Justice, Oliver Wendell Holmes. It seems to us that we can do nothing better than to reprint at this time part of the message to Senator Norris which we printed on December 26, 1923, affirming once more the sentiments therein:

Greeting! For twenty years you have sat in the seats of the powerful in Washington and served your country faithfully and well. During all that time, unlike many of your legislative associates, your soul has been your own, your vote the vote of conscience. Wherever you have gone men have respected you, political opponents have envied and feared you. They saw you enter the Senate a reformer, a progressive; some among them, laughing cynically and, pointing to many an example in the Senate chamber, declared: "The system will overcome him." The system found itself baffled by a brave and honest man. The years passed; you were progressive still. The Great War came, beclouding men's minds, instilling passion into their hearts, making them give out only words of hate and unreason. You remained clear in vision, temperate in speech, loyal to the core. You voted against the war which was a crime against America and its every ideal, and in so doing you kept the American faith. You have kept it ever since. Always you have been the captain of your soul.

IN PERIODS of economic and social distress such as the present we are sometimes prone to overlook the remarkable scientific research that is going on all about us, and to forget the infinite capabilities of the human mind. One page of the *New York Times* recently brought us four striking examples of the progress being made in the realm of pure and applied science. From Calcutta came the announcement that Sir Chandrasekhara Venkata, this year's Nobel prize winner in physics, had discovered "proof that light consists of particles possessing additional attributes of angular motion which hitherto have been regarded as theoretical." In a popular lecture in Berlin Professor Albert Einstein described "a dynamic conception of the universe which regards its size as changing with time, as against the older static conception which dealt with fixed magnitudes." Here in New York the International Telephone and Telegraph Company announced that "a device for recording telephone conversations, local, long distance, and transoceanic," had been perfected by Dr. Curt Stille, a Berlin scientist. Lastly, from Bochum, Germany, came the statement that "albumen can now be derived synthetically from coal." This statement was made before the Society for Coal Research by Professor Wilhelm Gluud, discoverer of the process. Three of these discoveries come from Germans. They illustrate the fact to which we have previously called attention—that under pressure of dire necessity German scientists are achieving as never before.

NOT SINCE A CERTAIN fabled color-blind captain entered the Black Sea in mistake for the Red have we had so remarkable a story of wild wanderings as those of Hillig and Hoiriis on their aerial "joy ride" to Denmark. Supposed to be heading for Copenhagen via Ireland and England, they became completely lost, wandered over Spain and over France, and finally landed by sheerest luck at Krefeld, Germany. Taking off from there they first hit Bremen and then Hamburg, finally turning up in Bremen

unable to move farther because of lack of sleep and exhaustion. In their case, "Wings over Europe" but states a fact. They, too, like Wiley Post and Harold Gatty, have shown again that the Atlantic can readily be spanned if conditions are favorable—a big if, for the Danes had a bad storm to contend with. The time of Post and Gatty, only sixteen hours from land to land, is phenomenal. If luck continues with them on their trip around the world, they will almost be back in New York by the time this paper reaches our subscribers—the eighty days of Jules Verne's imagination will have become ten days for American skill and enterprise in 1931! Mere records count, of course, for nothing. But the development of the art of long-distance flying warrants long hops. Only—we must once more express our antiquated regret that the world shrinks so rapidly, and that with it disappear so many chances for adventure and exploration.

THIS DEBUNKING of our national heroes ought to stop somewhere. It was perhaps useful to learn of some of the unpleasant facts in the lives of prominent American citizens long dead, but when the debunkers start in on our modern heroes more recently deceased, such as our highly prized gangsters and gunmen, it would seem high time to call a halt. We have for years been reading about the elaborate and expensive funerals given the more successful of the gang leaders, never doubting that these spectacular burials were as costly as they were said to be. But now a manufacturer of coffins has come forward to reveal the truth that the \$15,000 solid-silver caskets are actually made of cheaper stuff, the outside being sprayed with silver paint. They really cost only "\$200 to \$400," said this literal-minded person, adding that the cost of a whole funeral, "exclusive of the floral tributes, is much more apt to be less than \$1,000." And so we are deprived of another delightful legend. When or where will this ruthless revealing of truths which had better be forgotten come to an end?

BORN ALOYSIUS SMITH in Lancashire, known for many years in Africa as Zambezi Jack the peddler, Trader Horn has gone on his last adventure. He died in Kent, England, where, on the last strange turn of his fortunes, he had been living comfortably with a married daughter after a lifetime of financial uncertainty. He spent his youth in traveling about the world and his old age in telling of it to anyone who would listen. The happy circumstance that drove him in Cape Town to Mrs. Ethelfreda Lewis, who was able to make him tell his tales coherently and in a form she could write down, brought forth a book that thousands have enjoyed. From an itinerant peddler of kitchen wares, he became the pet of literary London and New York, dining at elegant tables, entertaining those who were not easily entertained with magnificent tales whose proportions of truth and fiction he had long since forgotten. Nor did it in the least matter. He was first a vigorous and enthusiastic traveler; then an aged and amusing raconteur. And not the least of his adventures was the one that brought him fame at eighty. When a young man becomes famous and then dies he is fortunate; when he lives to see his early eminence dwindle into obscurity he is the unhappiest of mortals; but when he lives through a long life unknown and rises to what for him are the heights of fame at a great age, he is chosen of the gods.

Now, Mr. Hoover, Disarm!

JUST what caused President Hoover to change his mind so suddenly as to Germany, reparations, and debts, we, being without the confidence of the White House, know not. But when the realization came to him at last that Europe was, as *The Nation*, and higher and better authorities than ourselves, had for weeks been maintaining, on the verge of a terrific catastrophe, President Hoover lost not a minute in acting and acting spontaneously and well. Late, of course, he was. It is yet to be shown how far a year's postponement of European payments will set the millions of unemployed in Europe and America to work, how far it will block the headlong plunge of the European Powers toward bankruptcy, anarchy, and chaos. But nothing has happened since our last issue appeared to make us question that a marvelous step toward the rehabilitation of Europe is now assured. More than that, we believe—tell it not in Gath, which is Paris—that the Young Plan payments will never be renewed in full, that the plan itself is definitely breached and must be made over, and that another advance has been made toward the rewriting of the Treaty, that is the Madness, of Versailles.

These things lie in the future. As soon as the decks are cleared—and we have no fears as to any serious obduracy on the part of France—the next immediate objective is the Disarmament Conference at Geneva, in 1932. There lies the next rampart to be taken by storm, for within it is one of the six or seven major causes of Europe's falling to its present low estate. The swollen armaments of Europe have contributed not one whit to its safety or peace. On the contrary, they are one of the potent reasons why Fear stalks abroad in all the lands overseas touched by the World War. And hand in hand with Fear run Suspicion and Hate, its handmaidens. Each government watches what the next is doing. Each government demands more ships and gases, men and guns, tanks and planes; yes, so do even the happily disarmed nations. If this state of dread and unrest and incredible waste is not concluded, there can be but one end to it all—another holocaust with dire results.

If any man would deny this contention, let us point out to him what the actual figures are: Belgium's debt payments to the United States were but 2.01 per cent of its budget for 1930-31, while for armaments it is expending 10.3 per cent. France paid only \$44,350,000 to the United States in 1930-31, while its military and naval expenditures reached the enormous sum of \$432,000,000—2.24 per cent against 21.9 per cent. Even in Great Britain, sorely harassed as it is, only 4.2 per cent of its budget came to us, while military and naval expenditures took 14 per cent. In Italy the comparison is even more striking. Its payments to the United States are only six-tenths of 1 per cent of its entire budget, while more than one-quarter, 25.4 per cent, goes to preparations for mass murder. So in Rumania, so in Poland. Only in Germany is the proportion reversed; its military and naval expenditures—still much too high—constitute 11.6 per cent of the total, whereas for reparations and external war charges Germany is assessed no less than 22.04 per cent of its outgo. If the mere forgiving of these smaller

sums for one year can thrill the whole world, set every market to throbbing, and specially cause to rejoice the nations of Europe, what would not be accomplished if the insane waste of money for armaments were even cut in half?

Fortunately, Mr. Hoover has come more than ever to see the tremendous opportunity to end this waste of treasure, this criminal diversion of valuable capital. He has not always seen clearly in this matter, nor striven toward the goal as effectively as possible. We are not forgetting his repeated appeals to the nations to disarm, but we must recall, too, the wretched tactics and strategy on our part in the all but abortive Naval Disarmament Conference in London. Headed in the right direction, Mr. Hoover has not picked the right men to represent us, nor known how to give them a program. He has not correctly portrayed in his public addresses the military situation and policies of the United States. He has repeatedly stated that we could not reduce our land armaments because we had already gone so far in that direction. Even in his address to the International Chamber of Commerce in Washington on May 4 last, he said: "The United States has a less direct interest in land-armament reduction than any of the large nations because our forces have already been demobilized and reduced more than all others." Obviously he forgot Germany and Austria and Hungary and Bulgaria—the beaten Powers now disarmed. He did real injustice to England, which alone has decreased its expenditures for army and navy, reduced its officers, and cut and slashed year by year until its Navy League is frantic, as Mr. MacDonald declared in his remarkable speech on June 29. He forgot his own Presidential message of December 3, 1929, in which he said: "After 1914 the [our] various army contingents necessarily expanded until the end of the Great War and then proceeded to the low point in 1924 when expansion again began. In 1914 the officers and men in our regular forces, both army and navy, were about 164,000; in 1924 there were about 256,000, and in 1929 there were about 250,000." In his next sentence he admitted that "our citizens' army, however, including the National Guard and other forms of reserves, increases these totals up to about 299,000 in 1914, about 672,000 in 1924, and about 728,000 in 1929." There has been no change since 1929 except in the direction of further increase—the War Department continues to commission reserve officers, and it is understood that there are now close to 110,000, although we did not have five such officers when we won the war to end war. How could Mr. Hoover forget facts like these—that our forces had been increased from 299,000 to 728,000 and more—and dare to say to the visiting members of the International Chamber of Commerce that our land armament has been "reduced more than all others"?

But if this is a sorry example of loose Presidential thinking, three recent happenings have given us hope that here, too, Mr. Hoover has seen a great light. In the first place, the President has announced that on his present trip to Europe Mr. Stimson will discuss the question of disarmament with the heads of other governments. Next, Mr. Stimson's publishing on June 15, voluntarily, a complete

statement of our effective military and naval forces (without reserves) is additional proof that the government is ready to lay its cards on the table even now. Finally, and most important, there is the Administration's recession on the matter of budgetary limitation of arms. No less than thirty-eight national organizations had appealed in June to Mr. Hoover to accept the principle. But at every conference hitherto the United States has opposed the plan of reducing armaments by limiting military and naval expenditure. Thus Ambassador Gibson has made the point that monetary fluctuations and differences in the various countries prevent this method of limitation from being "a true measure of armaments or a fair basis for limitation of armaments." The United States Government has also been opposed because acceptance would involve some form of international supervision by the League of Nations, and the United States did not wish to put itself in that position. Hence, the sudden change of position of Washington gives ground for hope that this time the United States will enter the Disarmament Conference with a fixed policy and, what is more important, a spirit of determination to achieve concrete results, instead of taking the attitude at the outset that it could not consider this or compromise on that, and that so far as its land forces were concerned it had nothing to yield, although its total military and naval expenditure, as Mr. Hoover himself has pointed out, is "in excess of those of the most highly militarized nations of the world," and the "programs now authorized will carry it to still larger figures in future years."

The way to disarm is to disarm. There is no prouder chapter in the history of the United States than the fact that during the first 111 years of our national history our regular army never rose above the figure of 25,000 men, and our fleet was negligible save during the Civil War; during this long period we never had a foreign war that was not of our own seeking. If Mr. Hoover were the ardent peace lover, the sincere and earnest Quaker, that he claims to be, he would have insisted from the moment of his taking office that there should not only be no further increases on land and at sea, but that our military and naval forces should be steadily reduced as conclusive proof to the other nations of the world of our sincerity in urging disarmament. If the other nations of the world have not believed in our sincerity in urging them to disarm, we have only ourselves to blame. Mr. Hoover should now enter the Disarmament Conference determined to disarm, and let it be known that the United States is ready to lead the way.

We have still another constructive suggestion to make. There are two men on the other side of the ocean, Prime Minister MacDonald and his Foreign Secretary, Mr. Henderson, who have their hearts set upon a great success at Geneva in February of next year. We urge upon Mr. Hoover that through Mr. Stimson or directly he come into touch with these two gentlemen, and agree with them upon a radical program of reduction as to material, ships, troops, and expenditures, to be presented jointly in the name of the two great Anglo-Saxon countries at the very opening of the conference. There could be no better or more effective strategy than thus to take the offensive, and none that would as certainly bring about a long step toward the freeing of the world from the criminal waste of armaments that protect nobody and are merely guaranties of the continuance of war.

Another Bleak Winter

THE people of this country generally know little of what the relief workers are thinking and saying these fine summer days. Winter is still five months away, but the almoners of charity are already turning their minds anxiously to the task that is going to confront them then. It might be interesting to know what arrangements police and military authorities are contemplating if the civil disorders that some of them fear actually break out. But even if the dumb patience of the unemployed survives the strain of added months of undeserved wretchedness, and even if business picks up somewhat, the winter of 1931-32 is going to be a desperately hard one.

Washington has persistently refused to admit anything, and the President was reported on his return from the Middle West as rejoicing in the disappearance of bread lines from our cities. Yet Leo M. Doody, commissioner of public welfare for Albany County, New York, declares that "the number of families who still need some aid is almost as great as it has been for the past eighteen months," while Fred C. Croxton, acting chairman of the President's Emergency Committee for Employment, in his recent appeal to the Association of Community Chests and Councils to prepare for next winter, said, in words whose significance is not concealed by their studied moderation:

It is evident that there has been no emergency since the war which has demanded the help of public-spirited organizations more than the present unemployment situation and the problems which are growing out of it. The committee realizes that whatever the trend of business during the balance of the year the demand for relief will be unusually heavy next fall and winter. In fact, information has reached us that unmet needs for relief during the spring and summer are urgent in certain localities. Experience has shown that primary dependence for meeting this need must be placed on local sources, both of private charity and of local government.

The Association of Community Chests, under the presidency of J. Herbert Case, is accordingly girding itself for the task of raising \$82,000,000 for the coming season. There will be 380 independent campaigns in the 380 chest cities, in order that the sacred principle of local responsibility may be preserved. But among the 133 cities of more than 25,000 inhabitants having no arrangements for syndicated charity drives are numbered New York, Chicago, and Boston, so that the total amount demanded for private charity will be vastly in excess of the figure above. Moreover, even this is but a small part of the entire sum that will be required. Mr. Croxton finds that of the total relief expenditures of sixty-eight cities in 1930, no less than 72 per cent came from taxes, and Homer Folks told the public-welfare officials of New York State flatly that "the bulk of the cost of unemployment relief will inevitably fall next year, as it did last, on the public treasury"—but not, be it said, on the federal Treasury or big income-taxpayers, thanks to Mr. Hoover. During the first four months of 1931 Mr. Croxton's cities spent for relief 75 per cent as much as during the whole of 1930. In view of such facts, what is our situation likely to be next winter, with savings increasingly exhausted by the

long months and years of unemployment, with charitable resources strained to the breaking-point by the enormous demands of the past two winters, and with steadily increasing difficulty in the collection of local taxes?

We wish the community chests all success in their difficult undertaking; but we regard the existing situation, with the federal government refusing to do anything, as outrageous and intolerable in a civilized country. Several of the more progressive cities have done helpful and even notable work in the effort to relieve their unemployed and to do what is possible, in connection with local industries, to steady employment. Some States are beginning to consider insurance. But Mr. Hoover flatly refuses to let the federal government act. His Emergency Committee has from the beginning been hamstrung by orders from above; it is a huge publicity bluff. Porter R. Lee, director of the New York School of Social Work, one of the members who resigned when Colonel Woods withdrew, declared publicly that the committee, though concerned with the possibility of increasing employment, could not be stirred up to any effective interest in the question of relief. Thus far, with the Department of Labor at his disposal, the President has won his battle against adequate records, adequate employment exchanges, unemployment insurance, and comprehensive planning, even though public opinion has moved forward since the prosperity-besotted days of 1929; and what with summer weather and the European debt move, he now has successfully diverted public attention from the whole unemployment question. Will the distresses of another bleak winter lead him to yield on any of the essentials of an intelligent program?

The Tardy Law

ON June 23 Bernard K. Marcus and Saul Singer, president and executive vice-president respectively of the Bank of United States, were sentenced to prison terms of from three to six years for wilful misapplication of funds in connection with one of the many tortuous operations of the bank. Herbert Singer, son of the vice-president, received an indeterminate sentence which may run from six months to three years. The Bank of United States was closed by the State Superintendent of Banks on December 11, 1930. The bank had sixty-two offices in New York City; its depositors, many of them with very small accounts, numbered nearly 400,000, and its deposits, two weeks before the collapse, aggregated over \$200,000,000. The trial of the accused officials lasted twelve weeks, and was preceded by as many weeks of tedious and rambling investigation. By the time the jury rendered its verdict, the particular rascalities of which Marcus and the Singers were found guilty had been lost sight of in the mass of evidence and argument with which the case had been obscured, and not one newspaper reader in a thousand, it is safe to say, had any clear idea of what the whole proceeding was about. Of the 400,000 depositors who had been embarrassed or ruined, not one benefited by so much as a penny by the conviction, and the case itself was promptly appealed.

The case of the Bank of United States was tried in the New York State courts. On June 5, three weeks earlier,

the United States District Court at New York dismissed the suit brought by the Bank of France against the Chase National Bank and the Equitable Trust Company for damages amounting to over \$5,200,000 regarding a shipment of gold from Soviet Russia to which the Bank of France laid claim. The claim was filed on March 6, 1928. The trial of the suit began on April 6 last, more than three years after the claim was filed, and lasted nine weeks, but the decision of the court dismissing the suit was handed down the next day.

These two cases afford a striking illustration of the difference in method between the State courts in criminal trials and federal courts in civil suits. The case of the Bank of United States was, to be sure, a complicated one, the financial operations of the bank having been juggled in amazing fashion, but it would be hard to make a layman believe that after the necessary examination of the bank's affairs had been completed—a task which certainly should not have consumed nearly three months—the issues upon which the guilt or innocence of Marcus and the Singers depended should not have been sufficiently clear to enable a jury to reach a verdict with reasonable promptness. Instead, the court allowed the trial to drag along for weeks and weeks while lawyers piled up 8,000 pages of evidence and technical argument.

The Soviet-gold case, on the other hand, was comparatively simple, involving in the main only the question whether the Bank of France had any legal title to the gold, and whether, for the purpose of enforcing its claim, it had any right to bring a suit in the courts of a country which has denied to the Soviet Government diplomatic recognition. A nine weeks' trial of a case of this kind is certainly not speedy, and there is little to be said in praise of a procedure which allowed counsel for the Bank of France to declare that the defendants "took this gold from a party they knew stole it," and to assert that the gold was taken to the Treasury Department in order to persuade the American Government "to change its ruling not to recognize the Soviet Russian Government." This is mixing evidence with political harangue. Even so, however, the court took only a few hours to make up its mind.

For such improvement as has taken place in the federal courts great credit belongs to Chief Justice Hughes, who has continued the work of speeding up procedure begun by Chief Justice Taft, with the result that the Supreme Court adjourned with its calendar cleared. The State courts, on the other hand, may well study the remarkable career of Judge George A. Shaughnessy of the Milwaukee municipal court, who has not only kept his docket cleared but also aided effectively in ridding the city of gangsters. The example of the Lord Mayor's court of London in completing in a few days the preliminary examination of Lord Kylsant, one of the foremost business leaders in England, on charges arising out of the management of the Royal Mail Steam Packet Company, is a recent testimony to the traditional speed of English law. We cannot afford to allow popular respect for the courts, already seriously impaired wherever important criminal trials or cases with a political slant are concerned, to decline any further. The public has a right to expect that extraneous matter shall be wholly excluded from court procedure, and that decisions shall be rendered with as much speed as in other countries.

Michigan Passes the "Spolansky Act"

By MAURICE SUGAR

Detroit, June 26

I

FEAR and rage are twins, born of the same necessity." The twins are stalking through Michigan. Michigan industrialists are scared—and wrathful. On May 18, 1931, the legislature of Michigan passed a registering, photographing, fingerprinting, excluding, deporting, and jailing act. Governor Wilber M. Brucker approved it.

The act provides that any person of foreign birth who has illegally entered the United States cannot maintain a legal residence in Michigan or travel within the State. He is "declared to have entered the State illegally," and is "subject to deportation"; and "shall when detected be denied admission at its borders." Such person "is prohibited from having employment or engaging in business within the State except as hereinafter in the penal section of this act provided." (The exception generously permits employment as a convict in the prisons of the State upon conviction of violating the act.) No employer shall have such person in his employ. And no one "shall associate with such person in business as a partner or otherwise."

"Certificates of legal residence" shall be issued to all aliens legally resident in Michigan "after they have established proof of legality of their entrance to the United States from the records of the office of the United States Bureau of Immigration." Application for the certificate is to be made to the commissioner of public safety, it being necessary to file with him the required evidence; and "photographs, fingerprints, or such other evidence of identification as the discretion of the commissioner shall demand may be required of all applicants."

Employers must require such persons to produce a certificate of legal residence and whenever an applicant cannot produce a proper certificate, the employer must "promptly report the circumstances to the commissioner of public safety, giving the name used and the address furnished by said applicant." It is made the duty of all police officers to arrest any alien who does not possess the certificate, and to hold him under arrest "until his right of residence shall be established" or until he is sent to prison, after which the officers "shall at once deliver the person of such alien to the officers of the United States Bureau of Immigration, together with an abstract of the evidence of the proceedings."

II

The act was introduced in the House of Representatives by Representative Charles W. Cheeney, of Chesaning, a very small upstate town. The measure is beginning to be spoken of, however, as the "Spolansky Act." There is no one by that name in the Michigan legislature, but there is someone in the employ of the National Metal Trades Association and in the officialdom of the Union League of Michigan. And to know the story of the "Spolansky Act," it is necessary to know the story of Jacob Spolansky and the National Metal Trades Association and the Union League of Michigan.

Michigan is an industrial State, and it has been hard hit by the depression. On March 6, 1930, over 100,000 persons participated in an unemployed demonstration in the city of Detroit alone. A frightened and brutal municipal officialdom savagely attacked these workers and gave Detroit a striking view of unrestrained terrorism and violence. Since then there have been innumerable demonstrations of unemployed workers throughout Michigan, with attendant brutality and disregard of law on the part of public officials. Welfare work has failed to allay this rising discontent.

Another influence has contributed to the fear and rage of the capitalistic interests of the State. During the past year every one of the fifteen "private" banks in the city of Detroit closed its doors. In addition to these private banks a number of other banks in the Detroit metropolitan area have also closed. A tabulation of the depositors in the private banks alone shows their number to be 34,330, and the amount of their deposits to be over six and a quarter million dollars. Add the number of depositors in other banks closed in the Detroit metropolitan area and the total would probably run to over 50,000. The depositors of the private banks were in large part workers of foreign birth. In most cases the amount on deposit represented the total savings of the worker.

III

Such was the situation when Jacob Spolansky appeared upon the scene. Spolansky, a native of Russia, first became known in Michigan through the raid which he headed for the Department of Justice upon the Communist convention held at Bridgman, Michigan, in 1922. He is remembered as secretary of Branch 1 of the Russian Federation of the Socialist Party at Chicago in 1918-19. It is believed that he acted as secretary of the Socialist branch in pursuance of his duties as an employee of the United States Department of Justice. In reporting a speech which he made in Detroit before the Union League of Michigan in December, 1930, the *Detroit News* said:

During the World War he served in the Military Intelligence Section, Negative Division, of the United States Army. From 1918 to 1924 he was in charge of the Chicago District Intelligence Division of the Department of Justice. In 1926 he was retained by private interests in connection with the Communist strike in the textile industry at Passaic, New Jersey. In 1927 he was brought to Detroit to make a detailed survey of communistic and radical activities in the automotive industries.

The report of the Fish committee gave express recognition to Spolansky.

Spolansky has been in Detroit for some time as "special representative" of the National Metal Trades Association, and he has been cooperating with the immigration authorities. Under cross-examination in a deportation hearing held in Detroit last April, he disclosed that his employer, the National Metal Trades Association, has branches "in Detroit and thirty-eight other cities"; that the members of this asso-

ciation in Detroit are "General Motors plants, Chrysler Corporation, all the leading automobile manufacturers in this town with the exception of Henry Ford"; that the principal part of his work is "industrial-relations work"; that "quite a few people" are working under him; that he is "doing work in connection with subversive activities"; that a part of his work is "knowing the activities of the Communist Party in Detroit"; and that he receives "quite a lot of reports from different sources as to communistic activities in plants connected with the National Metal Trades Association."

Spolansky is vice-chairman of the Committee on Subversive Activities of the Union League of Michigan, which organization has an interesting official personnel. The chairman of its Council on Public Affairs is Colonel Walter C. Cole, former executive vice-president of the Metropolitan Trust Company of Detroit, director of the Detroit Board of Commerce, member of the Committee on National Defense of the United States Chamber of Commerce, and national president of the Reserve Officers Association of the United States.

Other officers and directors of the Union League are Frank W. Blair, chairman of the board of the Guardian Detroit Union Group, Inc., one of the largest banking institutions in the country, and director of the Michigan Bell Telephone Company and other corporations; Charles S. Mott, banker, vice-president of the General Motors Corporation, officer of eight other large banks and corporations, colonel of the Ordnance Corps Reserves, member of the Spanish War Veterans, Veterans of Foreign Wars, American Legion, Rotary, Kiwanis, and three Army and Navy clubs; James R. Davidson, director of a number of banks, officer of ten steamship companies, director of a railroad company, and member of the Republican National Committee; Charles B. Warren, corporation lawyer, banker, ex-ambassador to Japan and Mexico, colonel in the United States army, nominated by Coolidge for the office of attorney general and rejected by the Senate by one vote because of too obvious connections with the sugar interests; J. Walter Drake, automobile manufacturer, Assistant Secretary of Commerce under Coolidge, director United States Chamber of Commerce; H. B. Earhart, president White Star Refining Company, Vacuum Oil Company, National Bank of Commerce of Detroit; George R. Fink, president Michigan Steel Corporation; Charles T. Bush, vice-president Industrial Morris Plan Bank of Detroit, director Guaranty Trust Company; Lawrence P. Fisher, William A. Fisher, and Fred J. Fisher, all vice-presidents of General Motors Corporation; Hal P. Smith, general counsel Michigan Manufacturers Association; Clarence L. Ayres, president American Life Insurance Company, appointee of Governor Brucker as chairman of the State Advisory Finance and Accounting Council, other members of the council being Frank W. Blair and Charles B. Warren, already mentioned as officers of the Union League, and Arthur T. Waterfall, director Michigan Manufacturers Association.

On the Committee on Subversive Activities, along with Spolansky, there appear Chester M. Culver, general manager Employers Association of Detroit, and William H. Godson, instructor United States Army Organized Reserves and colonel in the regular army. A distinguished member of the advisory board of the Union League is none other than Wilber M. Brucker, Governor of Michigan.

The report of the Committee on Subversive Activities of the Union League of Michigan states that it "sponsored a series of meetings which were addressed by prominent speakers representing both sides of this question." "Both sides" must have been on the same side, because no one spoke in favor of the "other side." Spolansky was the star speaker. He spoke on two occasions, in his first talk narrating with relish his participation in the Palmer red raids in 1920, and playing upon his hearers' fears of Soviet Russia. In his second talk he emphasized the value of the report of the Fish committee, which had not yet been made. Seated at Spolansky's immediate left during this talk were Governor Brucker and the Honorable Charles B. Warren. All the talks led up to the address of Chester M. Culver, general manager of the Employers Association of Detroit, who made it clear that every strike in Detroit during the past fifteen years had been caused by Communist propaganda. Not wages nor hours nor working conditions had anything to do with these strikes.

The report of the committee is virtually a summary of the report of the Fish committee, a large part of it consisting of extracts from that document. The recommendations include the enactment of laws providing for the registration of all aliens, the immediate deportation of all alien Communists, the disfranchisement of native American citizens members of the Communist Party, the denaturalization of naturalized citizens affiliated with the Communist Party, and a prohibition of the placing of the name of the Communist Party on any election ballot.

IV

On the morning of May 19, 1931, Michigan awoke to discover that two days previous to adjournment the State legislature had passed the "Spolansky Act." Though it had been introduced more than a month before, not a single line had been given to it by the press. The legislature had not concerned itself with a single piece of legislation pertaining to the vital problems of the State, but had passed a bill sponsored by the D. A. R. to require school teachers to take an oath of allegiance to the country and its flag, had enacted measures regulating the occupations of cosmeticians and chiropodists, and had made the robin the State bird. There has been no confirmation of the rumor that the Union League will seek the repeal of this last measure because of the color of the robin's breast. Although unemployment had assumed tremendous proportions, no measure concerning this problem had as much as appeared in either house.

The Detroit *Free Press*, which quickly came out in favor of the "Spolansky Act," stated in its first news dispatch:

The measure was drafted by the Subversive Activities Committee of the Union League of Michigan after a series of weekly conferences with federal authorities in Detroit last winter. The lawmakers were told that one of the principal aims of the legislation is to reach Communists and Socialists who are attempting to stir unrest. W. D. Edenburn, lobbyist for the automobile industry and member of the Union League committee, guided the bill through the legislature.

The dispatch also stated that when one of the three dissenting senators attempted to have consideration of the bill postponed, "Senator Chester M. Howell told his colleagues the issue should not be delayed 'because the less that is said about the bill, the better it will be for all concerned.'"

V

According to the census of 1930 the number of foreign-born in Michigan is 840,268, of whom the number naturalized is 382,980, while 21,930 are listed "unknown." A dispatch in the *Detroit Times* presented as follows the contention of members of the staff of the attorney general who had studied the bill:

The practical effect of the law is to require all persons who are not obviously American-born to carry and be ready to produce at all times proof of their citizenship, birth, or right of entry into the United States. Any policeman may require this proof. The law says he may hold any alien who has not a certificate issued by the commissioner of public safety. The result will be that he will hold any one, citizen or alien, who cannot prove his right to be in the United States.

It is obvious that the bill will apply not only to aliens but to all foreign-born men, women, and children, since the required certificate would furnish their only protection, and even then not protection from arrest. The burden is thrown upon the alien to prove his legal entry into the country, and in thousands of cases this will be an impossibility. Efficient enforcement will require the State to set up a bureau of immigration and to patrol the State borders so that persons who seek to enter from Indiana or Ohio or Wisconsin can be scrutinized. Under the provisions of this law many persons not subject to federal deportation will nevertheless not be permitted to live in the State of Michigan, being unable to qualify as "legal residents"; and it requires only a recollection of the reign of terror which existed during the regime of Attorney General Palmer, so proudly recalled by Spolansky, to visualize the application of the law in the demoralization of workers' groups, of citizens equally with foreign-born, seeking to improve their conditions, and in the breaking of strikes for higher wages or shorter hours or improved working conditions. It is difficult to conceive of a more effective blacklist than that which will be furnished by the registration required under this law.

The passage of the measure created a great stir in the State. The Governor removed all doubts about his prior acquaintance with the bill by stating at once and emphatically that he proposed to sign it and that no one need make effort to dissuade him. But he reckoned without the tremendous foreign-born population of Michigan's industrial centers, and of Detroit in particular. He was swamped with protests. As if by signal members of all of the racial groups in the State became articulate, and these groups by no means represented aliens alone. The foreign-language press was vociferous in its protests. The latent liberal element was heard from. Working-class organizations of every conceivable type and character were stirred into action. The Governor became a little less cocksure; so when the Detroit Civil Liberties Union presented to him arguments to prove that the bill was unconstitutional, he suddenly professed an interest. He referred the bill to the office of the attorney general for an opinion upon its constitutionality, stating that if it were found to be unconstitutional, he would veto it.

The study of the constitutionality of the act was referred to Assistant Attorney General Charles Rubiner, who prepared a long opinion in which he found the act to be unconstitutional. Then a strange thing happened. The Governor and the entire staff of the attorney general went

into a huddle which lasted for four hours. It seemed that the problem of the Governor had become additionally complicated because some of the manufacturers of the State were apprehensive about the provisions of the bill which applied to them and made them subject to criminal prosecution. That was going a little too far. This apprehension, which resulted in representations being made to the Governor by some of the interests who had favored the legislation, was speedily allayed. According to the *Detroit Times*:

Assistant Attorney General Clardy urged the Governor to sign the bill, although his superior, Paul W. Voorheis, Attorney General, had advised the executive that the measure is unconstitutional. This opinion is shared by all of the assistant attorneys general except Clardy. Governor Brucker acted on Clardy's theory that there will be enough of the act left to make a workable law after the courts have nullified the unconstitutional provisions. *Clardy admits the section prohibiting the employer from hiring unregistered aliens is invalid.*

The result of the huddle was this: the opinion of the assistant attorney general did not become the opinion of the attorney general, because the attorney general refrained from signing the opinion prepared by the assistant attorney general. Newspaper dispatches referred to the incident by stating that the opinion was "suppressed." And the Governor, having no opinion from the attorney general to the effect that the act was unconstitutional, signed it, stating: "While the attorney general has indicated that some questions of constitutionality may be raised on certain provisions, yet it appears that at least that part of the act may stand which compels registration." Apparently the Governor feels that the purpose of the bill to destroy the militant labor movement of the State would be virtually accomplished by the enforcement of this provision alone.

VI

Immediately upon the signing of the bill action to restrain its enforcement was instituted in the federal court by the Detroit Civil Liberties Union, acting in cooperation with other groups, the attorneys being Patrick H. O'Brien, former circuit judge and well-known liberal, Theodore Levin and Nathan L. Milstein, recognized as outstanding authorities on matters of immigration and constitutional law, and Fred M. Butzel, prominent Detroit philanthropist and social worker, and brother of Henry M. Butzel, chief justice of the Supreme Court of Michigan. A temporary order was issued by the newly appointed United States District Judge Ernest A. O'Brien, restraining the State officials from enforcing the act. The hearing is expected to be held in the latter part of June, and the attorney general of the State of Michigan, who, it would appear, is of the view that the law is unconstitutional, will argue that it is constitutional.

In the meantime, more significant opposition is becoming manifest. Movements are under way by workers to stage gigantic demonstrations and protests against the law. Many political observers are of the view that when the Governor signed the bill he signed also his own political death warrant. However that may be, there is little room for conjecture about the stimulating effect of the law upon the growing class consciousness of the workers. Perhaps nothing has ever occurred in the State of Michigan which has aroused the workers as has the passage of the "Spolansky Act."

President Hoovers' Record

III. The President's Economics*

By HENRY RAYMOND MUSSEY

WHEN Herbert Hoover entered the White House, there were widespread expressions of satisfaction over the accession to the Presidency of an engineer and business man of wide experience who would lead the country, not as a politician, but as an economist, taking careful account of all relevant facts, and shaping policy in accordance with them. Today that illusion has faded. Facts and expert opinion alike are brushed aside when they do not agree with preconceived policies, and it has been generally discovered that the President's economics is the economics, not of the trained student of social affairs, but simply of a successful though not highly intelligent mining engineer and business executive. It is, in fact, the economics of 1831, not 1931. Mr. Hoover's lack of skill in dealing with Congress is often ascribed to his long habit of command in large affairs. When it comes to explaining his thinking, however, it is too often forgotten that the training and experience of his formative years were those of the mining engineer and promoter, engaged in the most speculative, ruthless, and exploitative of all industries, and that when the war brought him into public service, his work was the administration of material relief on a huge scale, and later, as Secretary of Commerce, the purely business task of trade promotion. Of the theoretical training that accustoms one to see an economic problem as a whole in all its relations he has none, and he discloses a surprising inability to translate experience into broader thinking.

The outgrowth of his training and experience is a kind of belated and bastard individualism, whose essence consists in letting the strong business man have his own way as far as possible, in the faith that the production of goods will thereby be most effectively increased. Thus there will be more for everybody, and the general interest will be served by the self-helping activities of the captain of industry. To this theory the President is passionately, not to say fanatically, devoted. No amount of evidence that things are not working out as his theory requires suffices to shake his confidence in it. Society to him seems to be a congeries of disparate individuals, not an intimately related series of members in which an injury to one is necessarily the concern of all. In his little book on "American Individualism" Mr. Hoover stated, with all the emphasis of italics:

Our individualism differs from all others because it embraces these great ideals: *that while we build our society upon the attainment of the individual, we shall safeguard to every individual an equality of opportunity to take that position in the community to which his intelligence, character, ability, and ambition entitle him; that we keep the social solution free from frozen strata of classes; that we shall stimulate effort of each individual achievement; that through an enlarging sense of responsibility and understanding we shall assist him to this attainment, while he in turn must stand up to the emery wheel of competition.*

The President's naive conception is clearly revealed again in his well-known King's Mountain speech of October 7, 1930: "In the American system, through free and universal education, we train the runners, and strive to give them an equal start; the government is the umpire of its fairness. The winner is he who shows the most conscientious training, the greatest ability, the strongest character." To the President the economic process, then, is a race between individuals (and a fair race at that) for prizes, not a collective undertaking whereby individual competition is directed to supply the food and clothing and other things needed by society. Further, in his thinking the prizes go to those who morally ought to get them. Actually they go to those who enjoy the greatest privilege through property ownership and other legal advantages, and to those who are self-regarding, ruthless, and wolfish in seizing opportunities.

In further illustration of Mr. Hoover's capacity for objective judgment in matters of this kind, the following passage, published in 1922, deserves quotation:

In Russia under the new tyranny a group, in pursuit of social theories, have destroyed the primary self-interest impulse of the individual to production. Although socialism in a nation-wide application has now proved itself with rivers of blood and inconceivable misery to be an economic and spiritual fallacy and has wrecked itself finally upon the rocks of destroyed production and moral degeneracy, I believe it to have been necessary for the world to have had this demonstration.

By contrast with the Russian disaster, there is in Mr. Hoover's mind no question of the success of our own scheme. As he said in his speech of acceptance, back in the almost forgotten days of 1928: "With impressive proof on all sides of magnificent progress, no one can rightly deny the fundamental correctness of our economic system." As satisfactory proof of his point he declares that we have more youth in institutions of higher learning than all the rest of the world put together; we consume four times as much electricity and have seven times as many automobiles per capita as they; our telephones and radio sets are four times as common as theirs, and our paupers only one-twentieth as numerous. Forgetting all the other advantages we have enjoyed, the President sees our happy situation as due to the incontrovertible superiority of the industrial scheme which he so passionately defends against all the inroads of social control. "We must follow our own destiny. Our ideals are a binding spiritual heritage. We cannot abandon them without chaos." What chance have plain facts and sober economic analysis in face of such spiritual fervor as this?

As for the practical conclusions of this belief, we learn from the speech of acceptance: "Government should not engage in business in competition with its citizens. Such actions extinguish the enterprise and initiative which has been the glory of America and which has been the root of its preeminence among the nations of the world." On this text President Hoover

* The third of a series of ten articles on President Hoover's Record. The fourth, President Hoover and Unemployment, by Senator Robert M. La Follette, will appear in our next issue.—EDITOR THE NATION.

has rung the changes in speech after speech. On this basis he vetoed the Muscle Shoals bill, alleging against it various bad reasons which really bore no relation to his inextinguishable opposition to government enterprise, succinctly expressed in his annual message of December 3, 1929: "I do not favor the operation by the government of either power or manufacturing business except as an unavoidable by-product of some other major public purpose."

Even regulation is only grudgingly allowed. The government should keep hands off unless it is absolutely obliged to take action. Because we substantially confer a monopoly on public utilities, indeed, we must regulate their services and rates, but the industries which produce and distribute commodities, like oil, steel, lumber, coal, copper, and manufactured goods of all kinds, must be left entirely to the control of competition, with such cooperation as the government can afford to the competitors. Yet, in fact, every government in the world, our own included, has been absolutely obliged under the conditions of modern economic life to abandon the idea of unrestricted competition as an adequate regulator of the production and distribution of wealth, and has supplemented it with, or substituted for it, a measure of social control so great that it is rapidly changing the very character of the economic process. It is, I believe, not unfair to assert that the fundamentals of Mr. Hoover's economics had been abandoned by most intelligent economists before Mr. Hoover was born. They are little more than a rationalization of the prejudices and desires of business men of the predaceous type, among whom chiefly will be found today any serious support for such views.

How has the President's economics met the test of actual application? At his inauguration he faced an insistent demand for farm relief. Agriculture, overexpanded during the war, carrying an impossible burden of high land costs due to high war prices, and of high prices for manufactured goods, in some cases tariff-inflated, called loudly for help to a country wallowing in prosperity. The obvious remedy for the situation, on the basis of the President's theories, was to take off any government-imposed handicaps on agriculture, and then if necessary to let the farmers fail, let the poorer land go out of cultivation, let the amount of agricultural produce decline, and thus raise agricultural by comparison with other prices, restoring to agriculture that "equality" with manufactures about which much is said and little is done. But the farmers have millions of votes, so Mr. Hoover after long hesitation came out for "a Federal Farm Board . . . not only to still further aid farmers' cooperatives and pools . . . but especially to build up with federal finance farmer-owned and farmer-controlled stabilization corporations which will protect the farmer from the depressions and demoralizations of seasonal gluts and periodical surpluses." Yet in calling for action he declared: "No governmental agency should engage in the buying and selling and price-fixing of products, for such courses can lead only to bureaucracy and domination." Now the Grain Stabilization Corporation subsidiary to the Farm Board is in fact almost exactly the kind of price-fixing agency the President had denounced; yet he was able to praise highly the whole measure establishing the board.

We know the result. The Farm Board has probably helped the cooperatives somewhat, though not always wisely. It has lost \$90,000,000 or more of the taxpayers' money in speculation ("stabilization operations"), has demoralized the

produce markets, and has accumulated vast stocks of wheat and cotton that hang over those markets like the sword of Damocles. Meanwhile agricultural prices have plunged downward to the lowest levels known in forty years. President Hoover is not responsible for those prices. He is responsible for sponsoring a scheme of "farm relief" embodying features so inept, so unsound economically, so contrary to all the teachings of experience that its disastrous results were clearly foretold by competent critics before it was inaugurated.

The tariff tells the same story. Mr. Hoover's supporters saw in him a great internationalist, prepared by broad experience to cope with the complex problems of international trade in the post-war world. In fact his Department of Commerce had been primarily a glorified sales agency. His campaign speeches had been filled with unreasoned predictions of "floods of goods" and tumbling wages and wrecked homes if the tariff were lowered. In the incredibly confused Boston address of October 15, 1928, he had managed, by lugging in the intricacies of "polyangular" trade, to deny the truism that if you hinder imports you must by so much hinder exports, and that if you hinder American imports you make it just so much the harder for European governments to pay their war debts to us. As if that were not enough, he further demonstrated his entire lack of any understanding of the tariff problem by urging revision of rates in any industry in which there had been a slackening of activity in recent years, thus in effect urging the maintenance of every industry just where it stood after the war, and preventing any better use of world resources. To equalize the difference in costs of production at home and abroad, he declared, was only to take from foreign producers the advantages they derive from paying lower wages to labor. That is, the only differences in costs of production are differences in wages. Has the President never heard that it is just the lowness of other costs that makes high wages possible, and that American exports of agricultural products and steel and machinery and automobiles and all the other goods produced at such low costs as to be exportable are turned out by the highest-paid labor in the world?

In view of his whole record it was singularly appropriate that President Hoover should sign the Smoot-Hawley bill in face of the formal protest of 1,028 members of the American Economic Association. In all the crises through which that measure passed, not once did he exercise his leadership effectively to prevent the enactment of rates that were economically unsound and injurious, politically unwise to a degree, and internationally provocative at a time when all the world was in need of healing. The act embodies an ignorant, narrow, selfish, predatory economics that carries in itself the seeds of its own destruction.

President Hoover's contemptuous disregard for facts, to use no stronger term in characterizing his treatment of them, was no less apparent in his veto of the Muscle Shoals bill than in his management of the tariff issue, and it has run all through his handling of the great question of prosperity and depression, which has also disclosed his extraordinary lack of understanding of the real working of economic forces. During the months of mad speculation between March 4 and October 23, 1929, no word of warning came from the White House. There is good reason for believing that the crash took by surprise the President and his advisers, living in the fool's paradise of the "new economics." Then came the hasty and spectacular conferences with business leaders to restore pros-

perity by proclamation, and on December 3, 1929, the economist in the White House declared:

I am convinced that through these measures we have re-established confidence. Wages should remain stable. A very large degree of industrial unemployment and suffering which would otherwise have occurred has been prevented. Agricultural prices have reflected the returning confidence. The measures taken must be vigorously pursued until normal conditions are restored.

The agricultural situation is improving.

Then followed the long months of evasion and misrepresentation of facts, in the doubtless well-intended, but blundering and bewildered attempt to conjure prosperity out of the vasty deep, while conditions inexorably went from bad to worse. And then, all the conjure magic having failed, there came the official discovery of "world-wide depression" as the demon responsible for our industrial woes. Can anyone point to a White House utterance disclosing any real comprehension of the underlying causes of that depression, so far as they have been worked out by the most competent economists, or any proposal for action based on a recognition of those causes? Until the President's recent call for a year's postponement of payments on war debts and reparations, not one. Even that action, highly commendable as it is, cannot fairly be interpreted as arising out of a clear comprehension of the economic realities of our situation. On the contrary, in his Cleveland speech the President, in his extraordinary English, insisted on the point that he has just recently reiterated at Indianapolis: "Because the present depression is world-wide and because its causes are world-wide, does not require that we should wait upon the recovery of the rest of the world. We can make a

very large degree of recovery independently of what may happen elsewhere." The same old illusion that a selfish, independent national prosperity is possible reappears, the same old eagerness to snatch prosperity for ourselves.

The months of failure of the tactics of ballyhoo, however, reminded the President of his distrust of government action, and in his annual message of December 2 last he announced: "Economic depression cannot be cured by legislative action or executive pronouncement. Economic wounds must be healed by the action of the cells of the economic body, the producers and consumers themselves. Recovery can be expedited and its effects mitigated by cooperative action." It is government action through wars and indemnities and tariffs and nationalistic restrictions and burdens of all kinds that has certainly contributed powerfully to the present situation, if not actually created it, as the President's action to save Germany now testifies. Yet in his capacity of economist Mr. Hoover disclaims government responsibility and blithely passes on the task of recovery to "the cells of the economic body." If those cells are undernourished because of unemployment, he sturdily resists all attempts to feed them by the use of federal power, lest we extinguish "the enterprise and initiative which has been the glory of America." Perhaps as we move on toward the third winter of unemployment, those hungry cells will draw comfort and sustenance from the utterance of the economist candidate at Boston in 1928: "The present issue is the well-being and comfort and security of the American family and the American home. On that issue my party presents, as proof of its capacity, the record of the growing comfort and security of the past seven years." How long ago 1928 seems!

The Enemy of Mankind

By ALBERT GUERARD

[In view of the world-wide interest in the position of the French Government with reference to President Hoover's proposal of a year's postponement of all payments on war debts and reparations, the following article on the state of public opinion in France, by a distinguished Franco-American scholar, is of special timeliness.—EDITOR THE NATION.]

CERTAIN people (in benighted France) are fond of pointing an accusing finger at the "enemy of mankind." The "enemy" may change: perfidious Albion, the incorrigible Boche, Mussolinian Italy, barbarous Russia, Uncle Sham—the name does not matter. It is the "myth of a guilty nation" that provides unspeakable comfort to the virtuous. Patriotic righteousness thrives on scapegoats.

Naturally, two or more can play at that game. If Georges Duhamel denounces "America, the Menace," America may retort by declaring that France is a public nuisance. Odd that while as individuals Americans and Frenchmen may get on famously, the two sister republics can do nothing but squabble like fishwives. Acrimony breeds acrimony, and so *ad infinitum*.

How can we break the vicious circle? Offering the other cheek would do it; but neither France nor America is a Christian nation—can a nation be Christian and live?

The root of the evil lies in the *national fallacy*—in the romantic notion that France is a person, with a definite character, a clear-cut thought, a will of her own. I have lived a quarter of a century in France; I have studied and taught her history and literature for an even longer period; I have come across many people who claimed to be "France" as loudly as William Randolph Hearst claims to be "America"; and I have not been able to convince myself that Jaurès and Déroulède, Anatole France and Paul Bourget, Romain Rolland and Charles Maurras, Louis Marin and Aristide Briand were identical and interchangeable.

The patriotic gospel in its purity is fascism; every thought that is not strictly "national" is an act of treason. There we have unanimity—artificial no doubt, but impressive and potent. Roughly speaking, Mussolini is Italy; or, if you prefer, Italy is Mussolini speaking roughly. Some Americans affect to believe that similar conditions prevail in France. Professor Carlton Hayes has a book on "France: A Nation of Patriots"; and R. E. Sherwood calls France "a Monadnock among nations." "Let the beautiful conception of the brotherhood of man and universal peace sweep across the earth and level the horizon, and France will remain, a solitary peak." This is eloquent, but singularly contrary to patent facts. "The brotherhood of man" was preached by quite a

few representative Frenchmen, such as Victor Hugo, long before Mr. Sherwood started reviewing books. And if the official doctrine of the French Republic (the rights of man, liberty, equality, fraternity) is not universally accepted in France, it is because there is no nation so frankly, so irremediably divided as France—unless it be modern Germany.

Briand, openly supported by the Socialists, pacifists, and internationalists, missed the Presidency by only a narrow margin. It is difficult to think of a major country in which such a champion of peace, reconciliation, and world organization would have had as good a chance. I doubt whether the editor of *The Nation* would be considered good Presidential timber in this republic of ours. France has her fascists and her Hitlerites, such as the *Action Française* group; they are vocal, even strident, but negligible. The French conservatives, including M. Poincaré, are no worse than the Tory diehards. The French radicals, of the Herriot-Painlevé type, are pink pills for pale people, but compare favorably with the liberals anywhere. In addition to those two moderate coalitions, committed to some form of nationalism, France has an enormous internationalist vote, for which there is no equivalent in this country. Apart from minor groups of socialistic trimmers and shilly-shalliers, the S. F. I. O. (French Section of the Workers' International) had 1,698,000 votes in 1928, out of a total of 9,351,000. Further left, the Communists polled 1,064,000. Their joint forces numbered 2,762,000, practically 30 per cent of the electorate. Naturally, Messrs. Maurras and Coty, those *abstrakteurs de quintessence* who represent a handful of sophisticates, will tell us that these men in their millions are not French. A disinterested student has a right to smile. It was Bagehot, I think, who said: "‘Un-English’ is a perfect fallacy in one word." So is "un-French."

"France," in international affairs, means the French Government. Even when a country is ruled by a man of iron will, a Richelieu, a Napoleon, a Bismarck, a Mussolini, his actions are far less systematic than old-fashioned historians would have us believe. The most formidable of tyrants grope, fumble, and stumble. There is no Richelieu in Paris today; and there is no policy that "France" is "relentlessly" pursuing. Between the rabid traditionalists, still dreaming of hegemony, and the out-and-out Communists, who want the French Soviet Republic to federate with Moscow, we find a bewildered aggregate of politicians, "with both ears on the ground," trying to thread their precarious way between ever-shifting groups. The same confusion prevails in all free countries. In those under a dictatorship confusion is worse confounded still beneath its imperious mask. One land alone has achieved consistency, and that is ours. For the last ten years we have so resolutely refused to think and to act that, at any rate, the world knows what to expect of us—and what *not* to expect: namely, leadership.

The French policy, therefore, is not a definite plan which we can no less definitely oppose; it is a wobbly resultant of many conflicting tendencies. Varying with the delicate balance of power at home, it changes also with the shifting of partners and opponents abroad. If the French elections affect the Quai d'Orsay, so do the German elections. The France that deals with Curtius is not quite the same as the France that cooperated with Stresemann, and still another France—unpleasantly bristling, I am afraid—would face Hitler tomorrow.

Retrospectively, however, it is not impossible to plot the general lines of French diplomacy; and we may surmise that its trend will remain unchanged in the immediate future. On the whole, the tendency thus defined may be identified with Briand. It is not a powerful organized party that has kept Briand at the Foreign Office for so many years; neither is it the prestige of a commanding personality. Briand has no genius except for conciliation; he is not a driving force, only a marvelously sensitive indicator. In the recent crisis *Le Temps* and *Notre Temps*, usually poles asunder, agreed that any foreign secretary would have to follow Briand's policy; only he might do so with less experience, skill, and prestige. And Briand, in his turn, may be identified with the spirit of Locarno.

The French Nationalists had their way after 1920, not in the extreme form of a military dictatorship, but in the much milder form of legalistic Poincaréism. They went into the Ruhr: the result was that Poincaré, in 1924, lost the general elections, and that the President who had backed him, Millerand, was compelled to resign. Poincaré the financial expert came back and saved the franc; Poincaré of the Ruhr stays dead, with Millerand's corpse in the next vault. Foch was a national idol; but his political views were quietly ignored.

A Frenchman, Léon Bourgeois, had advocated and baptized the *Société des Nations* even before the war. France indorsed the Wilson League, has remained constantly loyal to it, would like to see it provided with teeth. France, "the enemy of mankind," has joined everything that promised to make for peace and conciliation: League and World Court, Protocol, Locarno, Dawes Plan, Young Plan, Kellogg Pact. France has welcomed Germany into the League, with a permanent seat in the Council. France has recognized Soviet Russia. France has proposed the United States of Europe. It is an impressive record compared with ours; in ten years we have not been able to show ourselves as bold and as liberal even as Senator Henry Cabot Lodge.

If we attempt to rationalize into a program the trend of French policy, we may come to such a result as this:

1. France wants peace more than we do, for she has suffered from war immensely more than we have. She desires disarmament more than we do, for her burden, in proportion, is heavier than ours. But she believes that peace must be based on world organization. If we do not trust one another enough to agree upon law and tribunal, how can we trust one another enough to disarm? France wants to be able *either* to carry a gun or to rely upon the police. She is not unduly nervous; she has to be more cautious than we. If Mexico, with a grievance, had a population one and a half times as great as ours, if in addition Canada were a hostile country with a population equal to ours, and growing faster, if Japan's coasts were twenty miles away from ours instead of 5,000, we might see the disarmament problem in a different light. Yet we, unthreatened, maintain a navy second to none; our military expenditures are exactly double those of France (\$772,984,000 to \$357,556,000); France has reduced the term of service from three years to one, and the total army establishment from 790,000 in 1913 to 467,987 in 1930.

2. France stands for international law. She does not maintain that treaties should never be revised, but that they should be revised only by a peaceful and orderly process.

The Versailles iniquity, vitiated by the use of force, is being gradually superseded by free agreements among equals. Not Versailles, but Locarno, is now France's title to her eastern frontier; and for the economic stipulations of Versailles the Dawes and Young plans were substituted.

3. As a consequence, the nations which also desire that the status quo should not be disturbed by force naturally look to France as their leader. It is not France that is grouping them in order to secure her hegemony; they are liabilities, not assets. France is safe on the Rhine; she has no desire to incur responsibilities on the Vistula. Her alleged hegemony is a myth. The hegemony of Germany in Central Europe might be very real; the territories are contiguous, and there are already many Germans on the spot, with unforgotten traditions of predominance. But France is absolutely powerless to enforce her will upon Czecho-Slovakia or Poland. They stand by her only in so far as she is defending international law.

4. If such countries as Poland, Yugoslavia, and Rumania are militarized, it is not at the instigation of France, but because they are directly threatened—by Russia, Bulgaria, Italy. With their regimes and methods France has no more sympathy than we have. But this is no reason why they should be the victims of injustice; two wrongs do not make a right. Why should Poland, for instance, lose her access to the sea, with an overwhelmingly Polish population? Why should the Magyars, a small minority in Transylvania, lord it again over the Rumanian masses? Why should Yugoslavia, which has already lost at least half a million souls and

her only modern port to Italy, be entirely and forever at Italy's mercy? France is not creating a league within the League, and does not say: "My friends, right or wrong." Every question has to be examined on its own merits.

5. In the debt question France has never stopped payment to us, even at the most bitter moment of the controversy. About her commercial debt (pre-war and post-war) there has never been any question. Her contention is that the war debts properly so called form part of the general settlement, and are to be discussed in connection with the reparation problem. This is not sentiment, but common sense. We may close our eyes to the obvious facts, but the Young Plan is manifestly based upon that assumption. France refuses to admit that we shall insist upon her repaying the uttermost farthing while letting the Germans go scot-free.

The "enemy of mankind" is neither France nor Germany, neither Russia nor America. Right and wrong never exactly coincide with political boundaries. The "enemy of mankind" is neither conservatism nor radicalism; both are healthy tendencies. The "enemy of mankind" is pig-headedness masquerading as determination. The French who declare: "Never shall we permit the Anschluss" are the enemies of mankind. So are the Americans who say: "Never shall we consider the League of Nations, the war-debt problem, race equality, the recognition of Russia." So are the British who maintain: "Never shall we admit the freedom of the seas." Such a stern, unbending, old-Roman attitude may win cheap plaudits; but the refusal to think, the refusal to discuss, is a confession of weakness.

Pennsylvania's Bloody Mine War

By FRANK BUTLER

[In his Indianapolis speech Mr. Hoover said that during this present depression "we have had freedom from strikes, lockouts, and disorders unequaled even in prosperous times." What, then, of the grave disorders that have been spreading through the soft-coal mining region? Do these indicate that we actually have the industrial peace of which the President boasted? Below we reprint an account of one of the many battles that have been taking place between miners and police. It was written by Frank Butler and published June 23 in the ultra-conservative Pittsburgh *Post-Gazette*, a Paul Block newspaper, by whose permission we are reprinting the story. Hence it cannot be said to have come from a source biased in favor of the striking miners. According to the *Post-Gazette*, "Frank Butler, *Post-Gazette* reporter, and Chester Brown, staff photographer, witnessed yesterday morning the clash between striking miners and deputy sheriffs at the Wildwood mine, where one man was killed and twelve wounded. They were at the scene of the trouble before it began, saw every detail, and remained to pick up the dead and wounded after the shooting was over." —EDITOR THE NATION.]

THE sun had not yet risen from behind a bank of clouds over the Wildwood hills when the first contingent of pickets, defying the order of court, appeared on the hilltop overlooking the Wildwood mine of the Butler Consolidated Coal Company. They carried an American flag in the vanguard

and halted at the junction of the Wildwood and Gibsonia roads, some 500 yards distant up a steep hill from the mine.

About seven deputies were congregated at the entrance to the mine. Some had tear-gas bombs; others had revolvers, and there were a few blackjacks in evidence.

Shortly afterward the Allegheny County sheriff's wagon rolled down the hill with several additional deputies in charge of W. E. ("Silver") Braun. They alighted from the van and began to distribute shotguns among the deputies, who by this time numbered about fourteen.

The number of figures on the hillside began to increase until there were about seventy or eighty lining the roadside at the brow of the hill.

Just then an automobile drove past the throng, and a loud jeering chorus rose up and several bricks crashed against the car. It sped on down the hill and stopped at the mine. Two miners alighted from it. Both were carrying revolvers. Two of the sheriffs ran over to question them.

Another car drove past the crowd of strikers on the hilltop. Another roar of rage rose up from the strikers and again a shower of bricks was hurled. The car slid to a stop in front of the mine. Every window in it was shattered. Two of the occupants of this car also had revolvers. One of them said he had fired several shots at the crowd but did not know whether any had taken effect.

Braun ordered several of the deputies to man the sheriff's van. One of the occupants of the last car, gun in hand, asked permission to join and jumped on the back step of the van as it started up the hill. Chester Brown, *Post-Gazette* photographer,

and myself, fearing to drive a car into the trouble zone, started across a field to make a short cut to the scene of trouble. Just as we neared the top two shots rang out. We cleared the brow of the hill and saw Herbert Reel, a deputy sheriff, backing out of an alley-way between two houses firing into about thirty or forty men and women. About eighty more miners came from behind another building on the Gibsonia road and started in the direction of Reel. The other deputies began emptying their guns into the throng and several in the front ranks were mowed down like wheat. I did not see a shot fired by the strikers. The deputies let go fusillade after fusillade of shots from pump guns and revolvers as the mob scattered and fled from the hail of bullets. In the midst of the melee one striker emerged from the throng and hurled a brick right into the muzzle of a deputy's gun. He was hit by a slug from a shotgun, spun three times, and fell to the road.

Reel rushed back to the sheriff's van, reloaded his gun, and with blood streaming down over his face rushed back to the house into which most of the rioters had fled, screaming "I'll kill every son of a — in that house," and emptied his gun at the house. Several of the wounded tried to crawl to cover, but another rain of bullets halted them. Two men lay in pools of blood in front of a Ford sedan on the side of the road opposite the deputies. I counted thirteen bullets in it after the fighting subsided.

The shooting began to quiet down and grew sporadic. Now and then a striker would emerge from cover and attempt to reach a hiding-place. He was quickly covered by the deputies' guns and herded into the van. Charles Hasford, president of the Butler Consolidated Coal Company, was present and pointed out ring leaders of the strike as they were thrown into the van.

Five wounded were lying on the highway unnoticed by the deputies, who began to search houses and march the strikers, hands in the air, in long lines into the van. I went up to Pete Zilgarac, who later died, and felt his pulse which was racing rapidly. His face was turning a pale green and he was bleeding freely from a wound in the stomach. I turned to one of the deputies.

"You'll have to get this man to a hospital," I said. "He's pretty badly wounded." The deputy rushed past me without stopping, gun in hand, yelling at a striker to stop. Three times later I went back to the man and still no deputy gave a minute's consideration to him. Two others were lying unconscious on the road, similarly unnoticed. Not a brick had been hurled or a shot fired for fifteen minutes, and still no attention was paid to the wounded. I appealed again to get the men to a hospital and my pleas were not noticed. One man lying in the road was dragged over to a pair of steps and thrown down.

Still the manhunt for strikers went on. Several with wounds in their legs and arms were herded into the van at first, but later were sent to the hospital with others. Finally Braun commandeered a coal truck, and another newspaperman and myself began placing the wounded in it, using two automobile seats to cushion their heads. They were all moaning for water and one was writhing in agony. . . . Only one deputy helped the other reporter and myself to lift the heavy miners into the truck. The others were busy hunting down strikers with their rifles. Finally we finished the load and clanged the heavy end gate against the men, and the mine president gave orders to take them to the West Penn Hospital. A few minutes later a car drove up with another miner wounded in the abdomen, and he was given first aid by Dr. J. J. Carman and taken by a friend to the Allegheny General Hospital. Later on another miner was found hiding in a cabin about a mile away with a wound in his heel. . . .

Reel hurled a tear-gas bomb into the window of a house which a number of strikers had fled to, and then was sur-

rounded by several other strikers who swooped down upon him. During the melee he was hit by a brick. He then backed away firing into the throng. Mingled with the curses and screams of the conflict were cries of frightened children in three houses which were sprayed with bullets during the riot. After the shooting had subsided the deputies and state police, who arrived on the scene just as the battle ended, searched one house and brought about twenty-four strikers out. Fourteen others were found hiding in the cellar of another. In all forty-one were taken into Pittsburgh to face charges and lodged in the Allegheny County jail. . . .

State police under Sergeant M. J. Crowley went after the man hiding in a house about a mile from the scene of the riot. He turned out to be Charles Adamic, one of the active organizers in the National Miners' Union. . . . One foreign woman, tears in her eyes, sobbed "If State troopers would be here now would have had all this trouble."

When quiet was restored, deputies sought out reporters and asked them "to give the deputies a break because there's going to be a big 'stink' about this." Several times they approached me and wanted to know what I was going to say about the fight in my story.

"I'm going to check your story very closely," Reel said; "You know well that we weren't on the offensive." "Clubs wouldn't have done any good in this fight," said another, as a reporter observed he was glad the State police with their stout clubs and with their rifles left in their cars were on patrol. The State troopers walked into a house to get Adamic with their guns not drawn.

In the Driftway

THE Drifter, as his readers are aware, has drifted all over the earth. Lately, however, he has ventured, even at his advanced age, to leave the earth with increasing frequency in order to soar into the clouds, and incidentally to deceive his friends as to his age and vigor. He has flown in various countries, beginning his air experience in a Zeppelin over Berlin a year before the war. He has speeded in a day from Warsaw to Strasburg, stopping hours on the way, has looked down the funnels of numerous great liners in the Channel, and has even covered the distance from London to Frankfort-on-the-Main in four and one-half hours—perhaps a little over double the time that Hawks would take for that run. But last week he had an experience he prizes as highly as any in his flying career—he twice left the earth in an Autogiro, that American development of the epoch-making invention of Juan de la Cierva, the brilliant young Spaniard. Thomas A. Edison said when he saw this extraordinary heavier-than-air machine: "That man has the egg of Columbus," and Lord Thomson, the British air minister and most charming of men, who perished in the R-101, declared to the Drifter the day he first saw the Autogiro: "That Spaniard has solved all the difficulties of the airplane."

* * * * *

WHAT was it that pleased the Drifter most in the Autogiro? Why, the fact that he actually *drifted* in the air. Every regulation airplane has to keep going at high speed or it will begin to fall. James Ray, the veteran chief pilot of the Pitcairn Company, which owns the American Autogiro rights, stopped the ship in full flight as if he had applied four-wheel brakes and an emergency brake too,

and the ship hovered. Of course it moved forward a little, and so it must when it makes its all but vertical descent for a landing in the manner of a feather on a windless day. Still, there it hung, and hovered, and poised like a bird, with the Drifter amazed and marveling, at so low an altitude as to have made the pilot of an ordinary plane shiver in his shoes lest his engine fail him. But the Autogiro's rotor, those long, flexible, horizontal blades spinning at 125 r.p.m. overhead and themselves able to move up and down and horizontally, too, continued to rotate, and the plane to hover until Mr. Ray speeded up the machine and went on. The Drifter felt not the slightest sensation of fear or anxiety as the plane stood still, and he confesses that on other occasions the sudden slowing down of the engine of the old-type plane has caused his heart to miss a beat. But the Autogiro falls not, neither does it spin—tail or otherwise. Its rotor is largely one piece, machine-made, and its blades move steadily as long as the ship goes ahead, though the rotor has no motive power of its own and no connection with the engine save through its starter. It is the air pressure which makes the rotor turn, with its doubly-hinged blades.

■ * * * ■

SO Señor de la Cierva dreamed a dream and made it come true. At fourteen he began to play with gliders. At seventeen he and two pals assembled the first airplane put together in Spain, out of the wreck of a crashed plane. By the time he was twenty-four he had built the first bomber constructed in Spain—it was the second tri-motor plane ever constructed in the world—only to see it crash to pieces at the hands of a highly experienced pilot through a bit of over-confidence in the take-off. Thereupon this young, romantic Columbus decided that it was time for him to take the dangers out of flying by making possible an immediate and safe ascent for airplanes, an easy, safe, and vertical landing, plus the ability to all but stop and to fly so low that one can drop a bundle of newspapers and hurry on to the next newsstand. There at Pitcairn field they rise so easily that the pilots sometimes fly to their restaurant—the restaurant to which they took the Drifter—some 500 yards away, and land in its meadow rather than transfer to their autos! Fine fellows these pilots. The Drifter liked their clean-cut faces, their lean shanks and lithe bodies, and noticed they had the faces of the pioneers he used to meet in the Far West years and years ago when he was a boy and rode for weeks where roamed only antelopes and deer and elk and moose and unpleasantly inquisitive bears. And they are pioneers, these pioneers and henchmen of de la Cierva. It was Ray, for example, who landed an Autogiro on the rear lawn of the White House just after President Hoover had handed the Collier trophy for the year's greatest achievement in aviation to Harold Pitcairn. It was Ray, too, who was scheduled to land a plane on a tall building in the heart of Philadelphia the afternoon the Drifter flew with him.

* * * * *

THE Drifter is more than ever sorry he is so old. Else, he would beg, borrow, or steal the wherewithal to buy himself the airplane with the horizontal-bladed windmill, this coffee-mill of the air, with which to fly and hover and drift aloft, and thus more than ever merit his name—

THE DRIFTER

Correspondence

A Neglected Socialist

TO THE EDITOR OF THE NATION:

SIR: Can you or your readers furnish me with information regarding the later life of the early English Socialist John Francis Bray? Bray wrote, during the Chartist movement in the late thirties of the last century, a book called "Labour's Wrongs and Labour's Remedy," which was published in Leeds in 1839, and which became one of the chief classics in early Socialist propaganda. Bray himself was born in the United States (probably in Boston) about 1809. In 1822 his father brought him to England, and the boy was apprenticed to a printer. During the thirties Bray became a prominent speaker amongst the Chartists, and this was when his book was written.

From some correspondence which has survived, it seems probable that Bray went back to America in 1842, and in 1846 he owned a farm at Lapeer, Michigan. In 1851 he removed to Pontiac, where he worked on a newspaper, and then, in 1856, we hear of him at Detroit, Michigan, where he had two years before given up the job of foreman of a daily newspaper.

For over thirty years we have no news of what happened to him; but about 1890 a Leeds printer, Mr. Patty, found—to use Patty's description—"his old friend Bray living within sound of the Falls of Niagara. He was now an old man, his face covered with a mass of grizzled hair which gave him the look of an old lion. He was earning his living by raising strawberries for market, and working occasionally for the papers."

A Leeds friend of mine, Mr. Mattison, who is, besides being a Socialist, an authority on the history of Leeds, has been carrying out a number of inquiries about Bray's life in England, and has asked me to do the same for his life in the United States. Mr. Mattison states that some years ago he had a cutting descriptive of Bray from an American paper in the early nineties. The article styled him "the oldest Socialist in the world," and among other things mentioned that he had been nominated for Governor of his State.

I am writing to ask, therefore, if you or any of your readers can give me information about Bray's life in the United States from 1842 onwards. Both Mr. Mattison and myself would be very grateful for any such information, which may be sent to me at 5 Wensley Grove, Scott Hall Road, Chapel Allerton, Leeds.

Leeds, England, June 1

A. LYLES

The Amalgamation Complex

TO THE EDITOR OF THE NATION:

SIR: In the review of General Pershing's book in your issue of May 20 there appear these remarkable words: "No American wanted to be amalgamated with the British; and amalgamation with the French offered special difficulties . . ."

I take this sentence to mean that there was no sentimental objection to amalgamation with the French but that such objection did exist to amalgamation with us. Now, can you tell me why? Am I not to be puzzled when day after day in English papers I read how friendly at bottom are the peoples of the United States and the British Empire? And yet they cannot amalgamate to subdue a common foe! That they are more different from one another than Australian and Japanese

is what this review implies, for a Japanese cruiser formed a unit in the convoy from Adelaide to Plymouth in 1914 when the first 25,000 Australasian troops came to our help and thought it no dishonor to be "amalgamated" with us.

I asked a Canadian acquaintance about this difficulty and suggested that it was caused by the feeling of the Americans that they might be considered inferior if they were not rather aloof. He replied that the inferiority complex, if it existed, was perhaps on the other side of the Atlantic. With that I closed the conversation.

London, June 15

F. M. KENYON

English as Taught

TO THE EDITOR OF THE NATION:

SIR: The editorial, Small Latin, Less Greek, which appeared in *The Nation* of May 27, contains some just criticism. In commenting upon Yale's decision the editorial makes this observation: "For it cannot be denied that a good part of the popular revolt against the classics is due to the ineptitude with which they are taught. . . . Surely there is something wrong here."

These words apply with equal force to the teaching of English. If English is a subject painful alike to study and to teach, this is because the language now is, and always has been, misrepresented in the school textbooks. The subject as taught imparts not the least inkling that English is a highly specialized, individualized, and simplified language—the most adaptable and the most logically constructed of all. Compared to it Latin and Greek are barbarous tongues. Its beauty, however, lies buried under a dead weight of meaningless terms, rules, and definitions taken from Latin and Greek grammar. It must be freed from these foreign entanglements if our students are ever to gain any understanding of their own language. Otherwise, I fear, Yale University (and others) will have to drop English too from the curriculum.

Milwaukie, Ore., May 29

HERMAN LEDDING

Walt Whitman

TO THE EDITOR OF THE NATION:

SIR: I am engaged in writing a book on Whitman and the Civil War. I should very much like to hear from collectors who possess Whitman manuscripts, letters, notebooks, or diaries which throw any light on his activity during the war. I am particularly interested in unpublished material. Any material sent will be copied and carefully returned. If the original is too valuable to be forwarded by mail, I should appreciate an exact copy. My address is 4130 Parkside Avenue, Philadelphia.

Philadelphia, June 9

CHARLES I. GLICKSBERG

MacLeod Again

TO THE EDITOR OF THE NATION:

SIR: In your issue of May 6 you published a letter from Norman Macleod saying that he did not write "German Lyric Poetry," as stated in your issue of April 1, but that "the Norman Macleod who did is, I think, an Englishman."

Shades of Skye and Lewis and Harris, not to mention Dunvegan, for a person named Norman Macleod to call another of like name an "Englishman"!

Honolulu, June 6

A. S. MACLEOD

THE SEX FACTOR IN MARRIAGE

By DR. HELENA WRIGHT

Introductions by Rev. A. Herbert Gray
and Abel Gregg

"Many married couples . . . lack the right understanding and enjoyment of the sex-act itself. It is to help such people that this book is written. The writer wants to give such definite and practical information that no one after reading it can any longer be ignorant of the nature of the sex-act, or fail to know exactly how it should be performed."

Havelock Ellis:—"There is probably no better small manual in simple language for married people."

BOLSHEVISM AT A DEADLOCK

Karl Kautsky
Translated by B. Pritchard

\$1.75

Unique among recent books dealing with Bolshevism and the Soviet Government

Kautsky considers Bolshevik theory and practice as an organic whole, and subjects it to critical analysis in the light of Marxian economics and historical science.

There Might Be Glory in the Night

By ANNE HAMILTON

Across the mesh of feathered pine
The moon has drifted unconcerned;
Three times the hungry owl has gone,
And three times furtively returned.
The shadow of the wicket gate
By inches eats the whitened road;
I sit and watch the flaccid hours
Bend beneath their overload.

There might be glory in the night
And rich exultancy to wait
In arrogance of certainty
For some swift hand upon that gate;
But never splendor in the sky,
Nor ever joy to comfort one
Who sits in terror through the dark
To see the rising of the sun!

A Puzzle for Politicians

Filipino Immigration. By Bruno Lasker. University of Chicago Press. \$4.

ARE we going to exclude Filipinos from residence in this country? And if we do, are we going thereby to commit ourselves to independence for the Philippine Islands? Perhaps the first action does not inevitably compel the second, but it is admitted by all shades of opinion that it greatly strengthens the argument for it. And as, in a general way, exclusionists are against independence and anti-exclusionists for it; we are cheek by jowl with a delicate issue, not to say dilemma.

In other ways, too, it is apparent that although the Filipinos are a lesser breed without the law, the proposal to exclude them raises questions possibly more far-reaching than any that have developed in the history of American immigration. We cannot legislate against Filipinos without repercussions upon our foreign relations with the entire Far East, without upsetting the situation in Hawaii, and without reference to our peculiar obligations toward the people of the Philippine Islands as our political wards for the past third of a century.

For three years there has been a bill before Congress for the exclusion of Filipino immigrants, the pressure for enacting which has grown with the increasing severity of our industrial depression. Filipinos, it must be recalled, are not American citizens but "nationals" of the United States. The Department of State uses the word to mean a kind of halfway limbo between American citizenship and allegiance to a foreign Power—with the disadvantages of each and the privileges of neither—but the legal status of a "national" never has been precisely defined. The proposed exclusion legislation would get around the difficulty by declaring Filipinos to be aliens.

In view of the importance of the issue and the many misconceptions surrounding it, the American Council of the Institute of Pacific Relations commissioned Mr. Lasker to make the study which has resulted in the present book. The council does not

take a position either for or against Philippine independence or Filipino exclusion, nor does Mr. Lasker. He set out to assemble available material as one would the pros and cons of a debate, and has done the delicate task with impartiality and intelligence. His book might have been more exciting if it had been more passionate, but it would have been less useful. It will be presented next autumn as a report to the conference in China of the Institute of Pacific Relations, and it should serve a wider audience as a source of reliable facts upon which to base opinion and action.

Most Americans, Mr. Lasker remarks in beginning his book, do not recognize a Filipino. Filipinos have been coming to the United States in appreciable numbers for several years, but generally—except perhaps on the Pacific Coast—have been taken to be Japanese or Spanish Americans. Only recently—with the considerable infiltration of Filipinos into hotel and restaurant service in the East—has awareness of the fact been dawning. Filipino immigration to the United States began in noticeable volume only a few years after the end of the World War. The census of 1920 counted 5,603 Filipinos in the United States. Mr. Lasker estimates that there are 60,000 of them here today and 75,000 in Hawaii. The great majority (ninetenths on the mainland) are males and most of them (four-fifths on the mainland) are under thirty years of age. An insignificant number of Filipinos come to the United States with the intention of remaining permanently, but actually only one immigrant in fifteen has returned home. Probably four-fifths of the arrivals have remained on the Pacific Coast.

Mr. Lasker points out, as others have noted, that whereas objection to Chinese and Japanese was almost wholly economic, the feeling against Filipinos has been, in predominating degree, social. The Filipino young man has spoken our language, dressed well, and had agreeable manners. He has seen no reason why he should not associate on terms of equality with American girls, nor have they—until in recent years somebody has told them the contrary. Mr. Lasker reports that the best-informed opinion does not find that Filipino young men differ much in their attitude toward women from that of other young men in the communities where they find themselves (unfortunately Mr. Lasker does not tell us what that is), although sometimes Filipinos fail to sense the delicate distinctions which conventional American opinion draws between liberty and license in sex relations. Can you blame them?

It has been a stock charge against succeeding waves of immigration to this country that they have been unassimilable. The Filipino has broken the tradition. And a lot of good it has done him. His reward is a hue and cry to keep him on his side of the Pacific because he is too assimilable.

ARTHUR WARNER

A Minor Epic

From Day to Day. By Ferdynand Goetel. Translated by Winifred Cooper. The Viking Press. \$2.50.

TECHNICALLY "From Day to Day" relies a great deal on clever management, and its theatricality is surprisingly reminiscent of Pirandello's best effects, where every hiatus in thought and motivation is overlaid by a new emotional surprise. Again as in the plays of the Italian dramatist, the tense absorption in the events of this novel does not seem quite justified by a later analysis in which one asks oneself the very pertinent question: "What has the author been trying to say?" Perhaps Ferdynand Goetel knows what he wants to say, and perhaps he has merely devised a new trap

for unwary emotions—his own as well as the reader's. But if the latter is the case, the trap is a clever one, and deftly sprung it catches and holds the reader at once in the tense atmosphere of this tale within a tale. And this, after all, is exactly as it should be, since in a world where every story has been told not once but a thousand times, it is chiefly the manner of telling it that counts.

What marks Mr. Goetel's work for considerable excellence is, again, his mastery of two styles in one book, which instead of clashing and confusing the issues, as ordinarily happens, serve to offset each other rhythmically just as they distinguish the two parts of his tale. One part—the prose part one might call it—is the diary of the author's life from day to day in Cracow, of his struggle with his literary as well as his more living problems. The other—the poetic—conveniently italicized, is the novel itself—the deep, rich, and tragic background against which the author's emotional life is set even as his diary is set against a more sensitive rhythm.

And both parts of the tale are apt enough, and pointed. There may not be a great deal to choose between a day-to-day recital of light living and loose thinking in a modern Polish city and a Hemingway allegory derived from the thoughtful perception that everything that is round is probably a doughnut, but the technique in either case is exquisite. The hero of the diary is laid fairly flat on the canvas so that his surroundings may appear in comparative relief, and the result is an interesting story. The novel itself is, of course, romance, an entirely creditable if much discountenanced approach to the problems of art, and one which gains in richness and color by contrast with the drab hues of the diary. To this combination the book owes its flavor, both of reality and of art. What all but destroys the illusion at the end is again a technical question—the forced abruptness of having two climaxes, one in the author's story and the other in the diary of his contemporary life, occur simultaneously, and the difficulty of thereafter rescuing a legitimate ending from the debris.

This may be merely the thorn on the rose bush, or it may linger on in the reader's mind as a question of the validity of Mr. Goetel's technique, since it seems to have got out of hand badly toward the end. But what one is most aware of, after all, on finishing "From Day to Day," is the actual participation in experience. Far from discipleship in the school that insists on serving up its slices of life in the raw, Mr. Goetel's book illustrates the point that good prose is not the arch enemy of good fiction. His story within a story is a formidable conquest of style over the unyielding forms of memory, and it is chiefly when it is checked against the loose and exclamatory prose of the diary that it achieves the heights of a minor epic.

EUGENE LÖHRKE

Primitive People of the North

Eskimo: An Epic of the North. By Peter Freuchen. Translated by A. Paul Maerker-Branden and Elsa Branden. Horace Liveright. \$3.

Turi's Book of Lappland. By Johan Turi. Edited and Translated into Danish by Emilie Demant Hatt. Translated from the Danish by E. Gee Nash. Harper and Brothers. \$2.50.

ONLY the simultaneous appearance of these two books prevents me from hailing either one as the best book which has yet appeared dealing with the life and attitudes of the primitive peoples of the North. Yet the two are so different as to merit comparison only in terms of provenience and great excellence. "Eskimo" is a story told by a white man who lived for many years among the Eskimos. It is not

ethnography, yet it is filled with interesting details of social customs and native craftsmanship, all subordinated, however, to the central theme—the story of a man who stood, physically and mentally, head and shoulders above his fellows. It is the only perfectly satisfactory attempt to treat a primitive people novelistically that I have ever read; the motivations, the conversations, the scenes all ring true. It is an accomplishment beside which books like "Batouala" of a few years ago seem grotesque.

"Eskimo" is no tale of a simple, superstitious-minded folk; it is a story of pride and violence, of the attempt of a strong man to dominate his fellows, of the ineradicable hurt given his pride and self-confidence by an encounter with white men from outside, and of the persistent dogged courage with which he works his way back into an almost incredibly isolated self-sufficiency. All through the story the reader is given invaluable insight into the psychology of a people who seem singularly little subject to any sort of complex culture. A man needs a wife; there are no unmarried women; so he takes the wife of a weaker man. A woman's husband goes away and leaves her in the charge of another; the husband is gone a year and the woman becomes the wife of the guardian; her husband returns, she greets him without enthusiasm and without comment, but after he has taken her, she is again unhesitatingly his. An orphan boy grows to manhood in the house of his foster-father; grown strong as his foster-father ages, he establishes his independence by a lucky blow which saves his foster-father's life; he demonstrates his independence by running away with his foster-father's favorite and youngest wife. Dark and slightly understood aspects of Eskimo life are lit up, as in the scene of the old grandmother who feels that she is no longer able to travel and commands her son to build her a snow hut in which she lies, walled in and dying, while her grandchildren's voices faintly pierce the snow walls. The isolated Eskimo household, held to no special locality, a traveling world of its own, is a splendid setting for the drama of struggle between a father and son—the struggle which psychoanalysts are so fond of to explain life in more complex societies. The subtler tragedy of the exceptional personality dependent on physical gifts to assert its natural right to power is as well told here as in more sophisticated novels.

"Turi's Book of Lappland" is of a different genre. It is the story of a primitive Lapp set down in his own language, which he had learned to write only after attaining manhood. Mrs. Hatt, the editor, has performed a tireless labor of love in drawing out Turi, selecting from his gifted story-telling those incidents most worth recording, and encouraging him in the long task of writing them down. The result is unique; we have the quiet detailed comments of a philosophic and completely unspoiled mind upon the difficulties and delights of daily life. However, the personal drama so conspicuous in "Eskimo" is completely lacking here. This is the story of a people who have been pushed ever back into more and more inhospitable country, where the daily struggle for existence is almost beyond human endurance. Turi's comment, although matter of fact, is strangely moving:

And when it is cold the tent cloth stiffens so that you can't fold it, and you have to dry it on the poles . . . and dry, too, all the clothes the folk have on, for those who have been out have their clothing wet through to the skin and they are so frozen that their legs swell and will hardly bend, and if they . . . can't get a fire they freeze to death. . . . During the Lapp migrations, and while they are watching reindeer, it often happens that a woman bears a child, and then there is nothing to do but to tuck it into her tunic and go on till she reaches the tents. . . . But if a woman is in camp she can go to bed when she has borne her child. . . . And if the woman does not get frozen, then she is well again in a week's time.

There is page after page of uncomplaining and fatalistic comment on all the illnesses and mishaps that the Fell-Lapp and his reindeer are exposed to—the cold of the winter, the lack of fuel and clothing, the diseases of the summer. All the slight signs by which the weather is told and all the magical significances of natural happenings are combined with matter-of-fact descriptions of incredible things. The unfamiliar detail, the precision with which sensation and portent are set down make this portrayal of primitive stoicism well worth reading.

MARGARET MEAD

The Test of the Teaching

Seven Types of Ambiguity. By William Empson. Harcourt, Brace and Company. \$3.

WE the more eagerly scan Mr. Empson's study of figurative language—"ambiguity"—in English verse, as the first published product of the teaching of I. A. Richards, who, as the author's "supervisor for the first part of the English tripos," told him to write this essay. In the pupil we discern an eager timidity on the trail of the master: a determined thoroughness in analysis, which moves toward distinctions without differences, and a profuseness of apology for the details and the overlapping that makes one impatient with what might otherwise draw one on.

The ambiguities Mr. Empson considers range from the use of one word in several ways at once, through the use of several devices that mean one thing, to the use of a word in opposite senses, "so that the total effect is to show a fundamental division in the author's mind." The body of the book is devoted to analyses of possible meanings, so detailed as to defy adequate quotation. For the first type, Jonson's poem on "Pan's Anniversary" tells us:

But when he frowns the sheep, alas,
The shepherds wither, and the grass.

The tail of the discussion points out that the "grass" here may mean:

"Men die like flies in the presence of His Majesty; one single tantrum from James leaves them nowhere" (I have the Bible behind me in saying this), and there is a hint of the Divine Right of Kings; or "a frown from James is to be expected at regular intervals, like winter; it should be accepted with resignation, and thought of as a type of the paths of mortality"; or regarding *grass* as an indifferent pastoral object, "after James has lost his temper the whole landscape is wiped out, including anything you like to mention"; or regarding it as something quite tough in the field, "a single frown from James quite permanently injures the subsoil of the neighborhood." The grace, the pathos, the "sheer song" of the couplet is given by a break in the voice, an enforced subtlety of intonation, from the difficulty of saying all these at once.

For the seventh type, Claudio in "Measure for Measure" speaks of his stainless sister:

In her youth
There is a prone and speechlesse dialect
Such as move men.

Prone means either "inactive and lying flat" (in retirement or with a lover) or "active," whether as *moving men*, by her subtlety or by her purity, or as *moving* in herself, for pleasure or to do good. *Speechlesse* will not give away whether she is shy or sly, and *dialect* has abandoned the effort to distinguish between them. The last half-line makes its point calmly, with an air of knowing about such cases; and, indeed, I feel very indelicate in explaining Claudio's meaning.

Mr. Empson must pause many times to admit that the reader need not, should not, hold all these possibilities separate in his mind while reading the poem; but from the sense that they are there rises the "ambiguity," the suggestiveness, the concentration of the verse. Some effective illustrations emphasize the part syntax may play in such concision; or puns—more subtle than Shakespeare's—

Golden lads and girls all must,
As chimney-sweepers, come to dust . . .

And there is good reminder of the Elizabethan repetition with a difference: "the slings and arrows of outrageous fortune," "the whips and scorn of Time," "in the dead wast and middle of the night" (which last strengthens its effect by a misspelling: waste, waist, vast).

The connotations of words, out of their source and history, make interesting study, and add to the poet's resources. This is as obvious as the recording of every possible association is absurd. After listing fourteen senses of Chaucer's word "lese," Mr. Empson adds, "I have put down most of the meanings for fun"; yet he is constantly as ready with far-drawn linkings, and the value of any suggestion lies in our feeling the force of it.

When James Joyce writes of mankind as developing "from atoms to it's," "Adam and Eve" lies buried in the movement from matter to metaphysics; but surely poetry is not to be reduced to such a guessing game. These eager analysts are in danger of destroying their work by proving too much. One who has read the poem they probe is likely to protest: "I understood it until you explained it to me!"

JOSEPH T. SHIPLEY

Two Immortals

Goethe and Beethoven. By Romain Rolland. Translated by G. A. Pfister and E. S. Kemp. Harper and Brothers. \$5.

DESCRIBED as a "magnificent dual portrait of two geniuses and the woman who loved them both," this book is in fact a hastily thrown together and careless assortment of the material for half a dozen magazine articles, badly prepared, badly translated, and pretentiously issued. There are some interesting anecdotes and quotations from letters, hidden away in the appendix, and several handsome illustrations, but the body of the book is dull, sentimental, and unimportant. The appendix is full of things that should have been worked into the book itself, and although margins are wide, type is large, and price is correspondingly high, so essential a thing as an index has been entirely omitted.

Rolland's attitude toward Beethoven is one of all-comprehending sympathy; toward Goethe, one of reserved disapproval. Beethoven emerges from the book a hero; Goethe a bit of a snob. Perhaps it is the pontifical and sentimental tone of Rolland's pronouncements that makes them especially annoying: "My blame is reserved for Zelter, the faithful but timid friend. For mediocrity cannot claim the excuses which we make for genius. If mediocrity be not good and loyal, what else can be said for it?" "The conclusion to which I have come is this: of the two men, the exalted and often-wavering Beethoven-Dionysus and Goethe the Olympian, it is Goethe who concealed the greater moral weakness." "I too have heard Clara Schumann speak of the old Goethe who raised her higher on her chair, so that her baby hands could reach the keys. 'N'ai-je point vu Goethe?'"

The translators offend in several directions. Distrusting, rightly enough, their own accuracy, they give nearly every other word of a quotation from the German in its original language,

whether the English word is an exact equivalent—as it often is—or not. Thus one gets passages like this: "What devilish work (*Was für Teufelszeug*)! And here, again, what charm (*Anmuth*) and splendor (*Herrlichkeit*) this fellow (*Kerl*) has produced!" Their translations are often unbelievably clumsy and sometimes quite inaccurate: "‘Lieder an die ferne Geliebte’ (To the beloved distant)."

Occasionally the translators take a thought from the original and sentimentalize it so that it is hardly recognizable: when Mendelssohn plays for Goethe a piano arrangement of the first movement of Beethoven's C-minor symphony, Goethe remarks: "Und wenn das nun alle die Menschen zusammen spielen." This is translated as "Supposing the whole of mankind played it at once," whereas "alle die Menschen" almost certainly refers to "all the men" in the orchestra, and Goethe doubtless meant: "If that's what it sounds like on the piano, imagine what a noise it must make in the orchestra!"

The sloppiness of M. Rolland and the inadequacy of the translators have not been helped by the editorial carelessness of the publishers, with the result that while "Goethe and Beethoven" is a very pretty book, it is far from a good one.

ARTHUR MENDEL

Closet Fiction

Werther's Younger Brother. Anonymous. New York: Carrefour Editions. \$2.50.

THIS is one of the first publications of that group of writers who prefer to remain anonymous—not only because they wish to establish "the art as the ideal, not the ego," but because, knowing that what they have to say is not what the general public wants, they hope, by forming a minority alliance, to create a special public of their own. Their scheme, in other words, is idealistic, and they hope it is practical too.

"Werther's Younger Brother" is the notebook soliloquy of an unusually introspective Jewish (unless I am greatly mistaken) student. The author aptly calls him "half a Hamlet, a Hamlet with only Hamlet, dreaming his soliloquy in a Denmark of the mind." Thus he is in love with his brother's wife and on several occasions seems to be in close relations with her. Once he tells her to "lie close" to him, another time he has "murdered" her. But invariably it turns out that he is only thinking or dreaming about her. As the inner life, therefore, of a particularly timid adolescent—one, moreover, who gives his timidity a dramatic turn and suggests finally that despite his hue and cry about his "suffering," nothing, not even that, means very much to him—this book surely has its ridiculous side.

But it has its merits also. It is the work of a tidy, dextrous stylist. There are some excellent lines. And it shows an understanding, as though by some age-old inheritance, of the inner meaning of things. If only because it deals so expertly, so traditionally with the inner life, it may be considered something of a novelty in American literature.

It will be taken to task for just that which makes it particularly appropriate as the publication of a minority group—its lack of universality. It is true that only a few earnest readers could be expected to take an interest in it. It has neither sensuous appeal nor story-telling charm. Yet I may say that I enjoyed it more than another story, of about the same length, which I read at about the same time and which recently won for its author a large sum of money and a good deal of attention. The other story invited me into it with much more skill; it had action, color, suspense; but in the middle it began to grow thin; I saw that it was second-hand and that its author understood but few of its essential implica-

tions. As I closed the prize-winner I realized that the modest anonymous volume had been a more interesting experience. (It is not, by the way, an introspective novel of the old-fashioned voluminous kind, but a dainty piece of classicism. If it had been written in France it might have had a vogue.)

It is dangerous to take a hard-boiled attitude toward work of this kind—let us call it closet fiction. Doubtless we are right in assuming that literature that is universal in significance will eventually make itself known to us all (though we must remember that most of the masterpieces of the twentieth century have not even yet been read by more than a few thousand). But if only because the organization of a minority is so important to all intellectuals, work of this kind should be encouraged. It is a breeze in the right direction, and God knows a hurricane is blowing the other way.

GERALD SYKES

Optimism Through Paradox

Paradoxy, the Destiny of Modern Thought. By Richard Rothchild. Richard Smith. \$3.

PARADOXY may prove more important as a portent than in itself. It is one man's honest and thoughtful attempt to find a meaning in existence. It poses again the old questions with which we shall doubtless never cease to be concerned: Is reality, as we call it, fact or fancy? Do we dream or wake when we trust the evidence of the senses? What is there to which we can hold fast in a shifting world? And newer questions: What shall we do about the problems which science shows no disposition to answer? Are science and the scientific approach to life, with its rules of observation and experimentation, any more than another faith, the latest convention by which men agree to play out the game they will never really comprehend?

It is Mr. Rothchild's contention that we need philosophy today as a major factor in our lives. The portentous quality of his book lies in his optimistic approach to the problems of life. His is not the philosophy of despair. He does not belong among the negativists who, seeing no hope anywhere and agreeing that man is a tormented, fantastic creature without hope of harmony in his life and with no other end than that of the worm's, nevertheless incomprehensibly exhort us to live according to a patterned decency and to die like gentlemen. It would seem that we have for some several years past been reading all the despairing futility possible into our circumstances and that we must now automatically swing back to a more positive and even hopeful attitude. It is possible that the next years will offer interesting opportunities to observe the building up of new, or adapted, illusions which will serve to make living seem again a tolerable, perhaps even a satisfactory and reasonable performance.

Mr. Rothchild's affirmation is religious, based upon the logical steps of his philosophy. From the study of the self, the structure of reality, and the similarities of fact and fancy, he follows the Kantian progression from the knowledge of self to knowledge of the world and finally of God. The will is the fundamental fatality illustrating the now famous second law of thermodynamics. The will is directive in time, always going forward and the one thing over which we have no control. The destiny of the will is to push continually toward the synthesizing of higher and higher unity. A Supreme Being gathers together our several unities into a supreme unity just as we gather together lesser unities.

Only by assuming such a being can we conceive of our own individualities. Just as the parts of a chair are discrete elements until synthesized in our consciousness, so would the individual

be merely a formal construction of discrete characters unless there were a synthesizing being to give *him* unity and life, and as a part of which alone he can live ■ practical, meaningful life. Science can never be the ultimate unity, for it recognizes only the mystery of the unknown and ignores the unknowable in which man finds his own soul. All life is a balance between opposites; all life is paradoxical; we strive toward deeper insight while cut off by nature from the possibility of any deep insight. But beyond the basic antinomy of existence is the mystic unity, non-paradoxical, the only certainty. Our urge toward the infinite, in relation to which alone the whole objective world gains its very meaning, toward an ultimate purpose, represents on the plane of practical living what we know in the intellectual world as the interest in philosophy itself.

Mr. Rothschild's is a wholly admirable attempt at furthering the desired synthesis of life. That his logic does not hold for me, nor his philosophy warm, nor his immortality as continuance in the Supreme Consciousness comfort me in any wise against this uncertain, brief, ignoble span of years, is but my misfortune.

LORINE PRUETTE

Books in Brief

Selected Poems of William Vaughn Moody. Edited by Robert Morss Lovett. Houghton Mifflin Company. \$2.50.

William Vaughn Moody, born in 1869 and dying in 1910, was a poet whose attainments were all but obscured in the rush toward rebellion of the so-called American renaissance. Now that the dust of that agitation has settled and we are again praising the more intellectual aspects of poetry, now that eccentricity of manner is no longer at a premium, we may read Mr. Moody with less obscured appreciation. Despite his rhetorical manner, his more personal poems are authentic. The *Daguerreotype* and *The Death of Eve* are finely sustained in their intensities. Certain of the lyrics from the *Masque of Judgment*—those in particular which deal with the theme of death (a theme which, because of his long illness, was very personal at the time)—are very good poems. The occasional poems still tire us, but the shorter, more directly conceived and felt poems show good workmanship and sincerity of emotion. Certainly some of Moody's poems will endure. In an admirable introduction, Mr. Lovett, Moody's intimate friend, gives a very interesting biography of this sensitive boy and man. We learn in detail of his Harvard days, days when Harvard meant the companionship of such men as George Santayana, George Pierce Baker, and others. We hear of his struggles as an instructor in Chicago University, his efforts to do his best both as teacher and writer. His friendships, his enthusiasms, his comments on his travels all reveal the spirit of the man. Finally came his long and fatal illness. Fortunately, these last years were free from teaching and Moody could give what energy he had to writing; he had achieved financial independence by writing "*The Great Divide*."

Whitegates. By Orgill Mackenzie. Coward-McCann. \$2.50.

This volume contains the first stories and poems of a remarkable new talent out of Scotland. The verses have charm and simplicity, coupled often with a touch of mysticism and madness. The element of fear and of Northland mystery is strong in the work. It is the stories, however, which make the publication of this volume an event of more than passing interest. One may be reminded of Katherine Mansfield, of Copland, and others because of their quality, but the tone in its finer shades is new to us and the voice a very lovely one. *A Chicken*, *Something Different*, and *Aunt Jessica* are tales that would not be out of place in any anthology of the best modern

short stories. Miss Mackenzie is an artist in her prose. Better still, she is touched with the increasingly rare gift for storytelling.

New Discoveries Relating to the Antiquity of Man. By Sir Arthur Keith. W. W. Norton and Company. \$5.

In this very excellent book Sir Arthur continues the story of ancient man begun in "*The Antiquity of Man*." Numerous important discoveries of human fossils and cultural remains have been made in many parts of the world since the last edition of the earlier work appeared, and these are described clearly and in detail. The story of man's evolution has been made a little less fragmentary. The widespread distribution of Neanderthal man throughout Europe and Palestine receives further confirmation, and again the enigmatic appearance of modern man presents itself to puzzle anthropologists. Sir Arthur finds increased reason to designate the southwestern corner of Asia as the birthplace of modern man. He carefully develops the significance of each new discovery, carrying the reader along in the reasoning that has determined his conclusions. When authorities disagree, both sides are presented, and the reader can follow the reasoning that has prompted the divergent opinions. This book summarizes many interesting facts, and—what is of equal importance—it presents a superb illustration of scientific method.

Eastward Ho! By Foster Rhea Dulles. Houghton Mifflin Company. \$5.

Taking his material from Hakluyt, Mr. Dulles gives here a spirited account of the British merchant navigators whose work, less spectacular than that of Drake and Hawkins, contributed perhaps more importantly to world intercourse and to the development of the British Empire. Lured on by the hopes of reaching the rich East by a Northwest passage, the first English navigators found themselves in the White Sea with the great Russian trade in their hands. The lure of the East led them on, and when overland trade with China through Russia proved impossible they followed the Spanish and Portuguese around the Cape of Good Hope and soon beat them out of the Indian Ocean. This traffic created the British East India Company and founded the British Empire. Mr. Dulles's style is compact and vigorous. In this book and its companion volume on Yankee enterprise in the first half of the nineteenth century, "*The Old China Trade*," he has given us two very interesting books on the history of navigation and trade.

Kinds of Love. By Max Eastman. Charles Scribner's Sons. \$2.50.

This is a collection of all the poems Mr. Eastman chooses to preserve—there are many new poems and many from earlier volumes. Taken all in all they prove conclusively that Mr. Eastman's poetry is derivative and conventional, decidedly of the older schools. His philosophy is that there is no absolute value except in having experience; his poetry is a reflection of this philosophy, and each poem in turn is a specific record of ■ personal experience. Hence the title, ■ title which is somewhat misleading, for the book contains many poems that have to do rather with the love of life than with any more personal emotion. Mr. Eastman's book "*The Enjoyment of Poetry*" has had so wide a fame that there will be many readers interested in the author's self-expression in verse. In general, however, his critical power as shown in that book is superior to his creative ability as shown in this volume of poetry.

Don Juan. By Joseph Delteil. Translated by Kay Boyle. Jonathan Cape and Harrison Smith. \$2.50.

This hotly perfumed, stylized reworking of the *Don Juan* legend has possible allegorical implications, but aside from certain

deftly fashioned episodes, like the attack on the youthful Don Juan by the washerwomen and the acts and thoughts of the elderly roué after his conversion, the retelling is thinly drawn out and of no great distinction. The translation is an excellent example of the ability of one stylist to reproduce the qualities and exactitudes of a stylist in another language.

Shakespeare's Hamlet. The First Quarto: 1603. Reproduced in Facsimile from the Copy in the Henry E. Huntington Library. Harvard University Press. \$4.

This is of course not the first reproduction in facsimile of "Hamlet," 1603, but it is the only one now readily available, since its predecessors have become both rare and expensive. It is to be hoped that the Harvard Press and the Huntington Library will combine to keep the present volume long in print. The work of reproduction has been carefully done, and the book is in itself as comely as it is valuable.

Russian Dance of Death. By Dirk Gora. Claremont, California: Key Book Publishers.

A teacher's diary records the horrors of death and destruction which overtook Dutch settlers in the Ukraine in the chaotic period after the World War. The simplicity of the narrative is moving, sometimes overpowering, in spite of the schoolmaster air certain passages have; and its authenticity never seems doubtful. As a document it is certainly valuable. As literature its directness alone makes it worth reading.

The Jewel. By Claire Goll. Translated by Pierre Loving. Alfred A. Knopf. \$2.50.

A serving girl from the French provinces who suffers and suffers, with pitying comments thrown in by the author, conceives a child by her Parisian employer, suffers again, and finally loses her position, her child, and her life. The obvious intention of this translated novel to be "brutal" and "realistic" with a vengeance reduces its effect to that of any "yellow-backed" novel occasionally distinguished by forceful writing.

His Monkey Wife, or Married to a Chimp. By John Collier. D. Appleton and Company. \$2.

A sometimes witty, sometimes confusing style adorns this fantasy of a monkey whose devotion to her English master gives her the inspiration to learn the language, to read in the British Museum, and finally to win the master for herself away from his bluestocking fiancée. Unfortunately, most of the delightful qualities of the book lie in the statement of the fantasy, and not in its elaboration into a novel. The obvious comparison it invites is with "Lady into Fox" or even "Memoirs of a Midget," and such comparison leaves the story of the refined monkey far in the rear.

Portrait by Caroline. By Sylvia Thompson. Little, Brown, and Company. \$2.50.

The eternal triangle is here handled intelligently and with a certain distinction, but it seems doubtful if Miss Thompson has succeeded in conveying to us much of beauty or newness or subtlety of approach in the realm of the emotions, particularly in that sphere which involves the relations between the sexes. There are some good conversations and a few moving scenes. The characters live and move, all excellently normal. But many of the episodes—the poker game is a glaring example—do not carry conviction. And the whole resolves itself into a problem drama which matters enormously, we are given to understand, to the people concerned, but which concerns us very little. Why should Caroline leave or want to leave her husband and her delightful (thanks to Miss Thompson) little girl-child, Anne? Why should she want Peter? The author has not made us comprehend this passion—or even believe in it. She

has taken an "affair" which never had in it the making of a drama, dignified it, and tried to convince us of its inner significance. The novel, in spite of a number of entertaining passages, remains singularly unimportant.

Films

Love and Sex

THE change of seasons is not supposed to have any effect on the quality of the movies, so it is impossible to blame the summer weather for the fare that has been offered to the public during the past month. To discuss these films individually as embodiments of definite creative ideas would be futile, for the only idea they try to embody is that of box-office appeal, and their success or failure in embodying it is accordingly the only important thing that distinguishes one from another. It might be profitable, however, to consider them in groups rather than singly, for this procedure at least promises a few interesting side-lights on the psychology of the American audience.

Here, for instance, is a group of films dealing with that most popular of all subjects, "love." As a general rule, of course, nearly every film has some sort of love story, but three of those I saw during the past fortnight—"Transgression" (Mayfair), "Men Call It Love" (Strand), and "Chances" (Hollywood)—had very little else. It is hardly necessary to add that they contributed little that was new to the lore on this subject. A conflict between a wife's loyalty to her husband and the temptations of a passionate Spanish admirer; a conflict between a wife's love for her unfaithful husband and the temptations of a polished and cynical admirer; a conflict between loyalty to one's pal and brother and love for the girl he also loves—such is the amount of originality in the stories of the three films mentioned. Having seen hundreds of similar films I am not surprised at that. What has always puzzled me is the mentality of the audience that accepts this sentimental "love" as readily as it does the most outspoken and lurid "sex." Is there any underlying unity between the two? Does not the extreme primitiveness of the emotional and intellectual content of this love reveal itself also in the ready acquiescence of the audience to sex *au naturel*, without the benefit of even a fig leaf? Ours is the age of naturalness, and boys and girls of today know more about birth control than their parents ever practiced. It is even possible to come across such scenes as I once encountered in an Automat of all places, where an angelic-looking young thing was listening reverently to a boy of twenty reading out passages from a book on sex and accompanying them with detailed comments on the mechanics of contraception. After all, if love is only that, one may just as well be frank about it.

It is facts like this that seem to link the sentimental with the brazenly sensual as springing from the identical mental state of intellectual and emotional primitivism. Not only is it true that the same public that wallows in cheap sentiment delights in watching the graceful May-poling around the thinly disguised phallic symbols of such a film as "The Smiling Lieutenant"; but one can go even a little farther and suggest that this public is only a step removed from the supposedly more intellectual readers of books that attempt to give information on "the right understanding and enjoyment of the sex act . . . exactly how it should be performed." The disarming naivete that characterizes the earnestness of their appeal signifies, it seems to me, the same simplicity and crudeness of feeling that underlie the sentimental love tosh of the films.

The utter triteness of the Hollywood love formula is brought home by the unexpected impression of freshness and significance produced by such an ordinary and not over-profound film as "The Skin Game" (Little Carnegie), based on Galsworthy's play of the same name. If only for that freshness it is worth seeing.

Censorship in the Irish Free State

By R. M. FOX

WHEN the Free State censorship bill was under discussion, I advanced the opinion in *The Nation* of May 8, 1929, that it was likely to result in an obscurantist attack on literature and thought. Now with the experience of the last two years it is possible to see how far this opinion was justified.

In front of me is a list of sixty-five books banned since May, 1930. Of these from eighteen to twenty are concerned definitely with problems of sex and birth control. The books of Dr. Marie Stopes and Margaret Sanger are on this list as well as several others written with expert medical knowledge. The Minister for Justice stated definitely that he did not intend to allow this subject to be discussed in the Free State, and the spirit of that utterance still prevails. In practice, however, it means that since denunciation of birth control became the fashion in Ireland, the subject must have been very widely discussed by people who do not read books at all. That this development has not improved the moral tone of the country is evident from the exhortations by magistrates on the subject of infanticide, which crime has increased.

Space will not allow an examination of the list in detail, but it includes such writers as Bertrand Russell, Aldous Huxley, Norman Lindsay, Joseph Hergesheimer, Isadora Duncan, T. F. Powys, Llewelyn Powys, Somerset Maugham, John Dos Passos, Michael Gold, Sinclair Lewis ("Elmer Gantry"), Sherwood Anderson, Rosita Forbes, Liam O'Flaherty, Sylvester Viereck, and Paul Eldridge. The two last are represented by "Salomé: The Wandering Jewess" and "My First Two Thousand Years." President Cosgrave, in reply to a strong American protest regarding these books, stated in a letter to Mr. Viereck:

The board is composed of distinguished citizens of different faiths . . . You will agree that among peoples as among individuals standards differ and that it is the right of any people, without imputing other than their own, to decide through their established institutions what does and what does not conform to their standards. That is all the Censorship Board or the Minister for Justice presumes to do.

It should be noted that this reply is apologetic in tone. Mr. Cosgrave shifts the responsibility from the government to the people in general. He abandons the ground, often arrogantly maintained in Ireland, that the standard is one of immutable high morality and makes it that of fitting in with popular prejudices and "susceptibilities"—a dangerous standard for those who believe in intellectual progress. Taken in conjunction with the names on the list it certainly supports the view that ignorant prejudice is being upheld against men who are recognized as stimulating intellectual forces in the world.

Unfortunately, his contention that the censorship is supported by "distinguished citizens of different faiths" is true. How it came to be so reveals the peculiar dangers of basing a censorship on the prejudices of a people whose

self-centered absorption in the national task has influenced different sections of the population in a curious fashion. In America we think of puritanism as taking the lead in any rigid censorship activities. Prohibition of books and liquor finds its natural stronghold in puritanical quarters. And in southern Ireland the Protestants have long regarded themselves as a virtuous minority which sets a rigidly correct example to their easier-going Catholic brethren. With the setting up of the Free State the Protestant minority had no longer such a favored position. Consequently this minority clings more doggedly to its idea of moral prestige. Whenever a cleric states that Catholics are determined not to allow the introduction of bad books or birth-control ideas and that Protestants who want these depravities must accept the ruling of the majority, there arises a horrified protest. Only those who have seen the "ascendancy" minority on their church parade and have noted their wintry superiority to the "natives" can appreciate the humor of the suggestion that they are clamoring for education in birth-control methods and access to bad books. These mentors and models for the Irish people rise in starchy and almost speechless wrath at the idea. So the special danger of the Irish situation is that the Protestant element, in their pride of status, may prove to be even more narrow than the clerical element. They can certainly be used to pull the clerical chestnuts out of the fire.

How far ignorant prejudice holds sway may be judged from typical happenings. Not long ago when Sean O'Casey's "Juno and the Paycock" was shown in a Galway cinema, a crowd of hooligans destroyed the film. No one has suggested that there is anything wrong with the moral tone of O'Casey's drama, and the action was strongly condemned in court. Although the film had been shown in Dublin previously without interference, there was immediately an imitative demonstration there. Another instance, by no means isolated, is that of three masked men who held up a bus containing English newspapers on St. Patrick's Day and burned the papers on the roadside, handing a note to the conductor telling him not to carry any more such papers as they were undoing the work of St. Patrick. Here we have the censorship of the gutter accompanying that of the board with lamentable results.

Turning from books to papers—which are also affected—we see how the decisions of the board work out in relation to them. It was announced, soon after the censorship came into force, that certain English Sunday journals which gave an undue prominence to forbidden subjects would be banned. But as a result of consultation with the board the ban was lifted from several of them and incidentally they secured a splendid free advertisement. Not long before, I had discussed news values with the editor of one of these journals. "Crime and passion are the only things that go," he remarked. "We've tried other things but it's no good." I was interested to notice that the ban was lifted from this journal. But the *New Leader*, a Labor journal which deals in a serious,

thoughtful way with modern social problems, is still banned. The reason is that a proportion of its space has been used to discuss questions of sex. Recently I heard a member of the board, Mr. Joyce—a name not unknown to Irish literature—state publicly that papers can always make representations to the board if they feel they have a grievance. And, he added complacently, all the papers which have approached us have admitted that they were wrong! The purely sensational press, moved solely by cash convictions, is able therefore by admitting error and making slight adjustments to get by the censorship, taking care to flatter the vanity of the censors. But a responsible journal which deals seriously with modern thought and cannot admit its error in doing so is permanently barred. The *New Leader* case illustrates, what Shaw has often pointed out, that censorship never hits the worst offenders; worthless stuff slides by while honest thought is checked.

A case involving the machinery of censorship has recently been tried in the Free State courts. Complaint was made that books not censored have been retained along with banned books. Shaw's "John Bull's Other Island" was held up in this way. Counsel for the state argued that the act empowered customs authorities to do this and that even a Catholic prayer book might be kept if found in bad company. For the bookseller this is a serious matter; for a book may be banned after it is ordered (which has actually occurred) and a whole case of books confiscated or held up till they are no longer salable. The bookshop which brought the action lost its case and had to pay costs. Later the chairman of the Booksellers' Association sent for the bookseller. He said that it was a pity for these matters to come into court, and

explained that the association would take all necessary action regarding books. The association had undertaken to facilitate the censorship and to keep out all "borderland" books that seemed likely to offend. This means that books in Ireland are subject to two censorships—official and unofficial. Certain authors, certain publishers are unofficially "discouraged."

An open censorship can be fought, but an atmosphere of censorship cannot be grappled with. This censorship atmosphere, which is not new to Ireland, has produced by reaction a tradition of Irish writers whose works figure on the censored lists of other lands. George Moore and James Joyce come immediately to mind, and a list could be given of younger Irish writers whose work bears traces of obsession with repressed and forbidden subjects. Writers and readers can usually look after themselves, but an atmosphere of censorship, limiting mental and moral growth, inclines the illiterate to an unhealthy preoccupation with what they are taught to regard as forbidden fruit.

The real problem of moral elevation in the Free State is how to get rid of rags, barefoot children, crowded tenements, high infant death-rates, insanitary and defective school accommodation, cabins like wild beasts' dens, so dark that the inhabitants cannot read anything. Men, women, girls, and boys are jammed in together, eating, sleeping, living in the same rooms. Is it suggested that there are facts of life or of sex that they can be informed about in books which they cannot observe?

Meanwhile the habit of censorship grows. Earnest men peer suspiciously at books, pitifully ignorant of the real purpose of literature in creating fuller, freer, and finer minds.

TROTZKY'S APPEAL TO RUSSIA to remove Stalin so that more Russians may live according to Marxist doctrines, and so that Russia itself may adjust its economic development to the world's economy, almost coincides with Stalin's new economic policy discussed by him at a meeting on June 23, but not published in Moscow until July 4. Stalin announces the practical abandonment of the five-day for the six-day week in factories, wherever factory work is not progressing satisfactorily. He also virtually sanctions unequal wages, establishes individual responsibility of directors of industry and workers, and readmits to favor engineers of the old regime, to whom he holds out an olive branch they have not known since the Communist rule began. These are surprising changes, especially his sanction of piece work and unequal pay, which the dictator defends on the usual ground that the present stage of the socialization of Russia is not communism, but merely a road to that goal along which any emergency measures may be adopted, however much at variance with the strict Communist theory. On the whole, however, this new policy is little more startling than Lenin's Nepman retrogression, under which a certain amount of private industry was permitted until all the state enterprises could fill the needs of the people. The Communist leaders, in other words, never hesitate to adapt themselves to emergencies, and they will have to continue to do so to

carry on. But that does not mean that the next change of policy announced will not be another plunge in the direction of pure and applied communism.

WILLIAM R. CASTLE, JR., Undersecretary of State, in his address on James Monroe and his famous doctrine before the Institute of Public Affairs at the University of Virginia, did well to recall that it is thirty-six years since the doctrine was last invoked. He admitted that so far as the original purpose of the doctrine is concerned, there is no longer the slightest need for its existence; "one cannot see the remotest possibility that we shall have to invoke it again." None the less, he would not have us "strike it from the roll of American responsibilities," even though he is ready to concede that "there still remains in Latin America a certain irritation toward the Monroe Doctrine." "It accomplished its task," he added; "in the changed circumstances of the twentieth century it offers no threat, but remains an assurance of our unswerving friendship toward our sister nations of this Western Hemisphere." To this we reply that every source of irritation between us and our fellow American republics should be removed at once. Also that the Latin Americans do not consider the doctrine or anything else "assurance of our unswerving friendship" to them, for they have good reasons in many instances to doubt whether we have any friendship for them at all. They still believe that they remain at the mercy of the whim of each succeeding administration in Washington. We are nevertheless glad that Mr. Castle spoke out as he did and that he acknowledged the Monroe Doctrine to be useless lumber in the State Department's limbo of outworn stage properties.

THE FARM BOARD DECISION to sell only 60,000,000 bushels of wheat in the domestic market during the coming year is a pitiful compromise. There remain in the storehouses perhaps 240,000,000 bushels of wheat as a carry-over, which, unless they are deliberately destroyed, will continue to overhang the market just as long as they are on hand, even though the board has promised not to dispose of them at present. In so far as this represents the board's independence of Executive interference, it is of course, welcome. But the truth is that the board has admitted its defeat. It has wasted millions of dollars in its futile efforts to peg prices, and has blamed the disaster upon the farmers, because they would not restrict their production; and it now repeats that restricted production is the only way out for the coming year, during which it will, fortunately enough, waste no more funds in efforts to stabilize world prices. Naturally, the farmers are anything but pleased at this situation. Even the sale of the 60,000,000 bushels will help to depress the price of wheat, and we shall doubtless see a new demand for export debentures and other dubious remedies for aiding agriculture. If ever there were shameful waste of public funds and complete mismanagement of a most serious problem, they are to be found in this record of the Federal Farm Board.

TWO WEEKS AGO we wrote that the circumstances attending the resignation of Dr. Ray Hall from the Department of Commerce had "thrown considerable doubt on the reliability of the department's business and economic information." Since then George J. Eder, chief of the Latin American Division, has likewise resigned his post, and under similar circumstances. Also since then Dr. Hall has brought very serious charges against the administration of the department. According to Clinton W. Gilbert, Washington correspondent of the *New York Evening Post*, Dr. Hall "says that the department suppressed information about the serious financial condition in Germany until it became evident that the American Government would have to take a hand for the relief of Germany." The dispatch went on to say that Dr. Hall once "reported from Colombian official sources that Colombia was in a bad way financially. The Colombian Minister protested. The report, copied in the Colombian newspapers, caused the fall of the government. When his next report on Bolivia came along Secretary Lamont took it to a Cabinet meeting, where its suppression was ordered. Not long afterward, Dr. Hall points out, Bolivia defaulted on its bonds with a large loss to American investors. It is suggested here that the Department of Commerce has not been alone in misleading the American business community; the Cabinet itself appears to have had a hand in the matter. The Hoover Administration must clear itself of these charges lest it lose completely the confidence of our business men and investors.

FLAG-WAVING and coercion have been enlisted by Matthew Woll in his campaign against communism. As acting president of the National Civic Federation, he has organized a committee of 600 men and women to carry on the fight with these weapons. Similar committees are to be set up in England, France, Belgium, Italy, Germany, Canada, and the Balkans. As the first step, Mr. Woll was indirectly quoted by the *New York Times* as saying, "those commercial interests in the various countries dealing with the Soviet regime would be asked to use their influence to force it to stop all propaganda looking to the overthrow of their respective governments, on pain of cancelation of all contracts and suspension of all commercial relations with it." But, Mr. Woll continued, should these commercial interests "refuse to exert such pressure, the patriotic and moral forces of the several countries should declare a boycott upon all Soviet products reaching their shores." Despite the growing criticism in the ranks of labor of his anti-Russian activities, Mr. Woll's strength must not be underestimated. Sentiment in this country for a more aggressive policy against Soviet Russia, with all the dangers that such a policy implies, is increasing. Not only does fanaticism of this kind hurt our trade; it is a direct peril to peace.

SAVINGS-BANK DIVIDENDS have kept up pretty well during the depression, but the action of a few of the larger banks in New York City in announcing lower rates for the July quarter probably foreshadows similar action by a good many other institutions there and elsewhere. The savings banks are in a peculiar position. Not many of the gilt-edged securities which were held by the banks as investments before the depression began have suffered dividend reductions, and income from these sources is reasonably

secure. The great accumulation of idle money due to the slackening of business and speculation, however, together with the decline in the volume of new bond issues, the lowered rates on thrift accounts or time deposits in banks or trust companies, and the passing or lowering of dividends on hundreds of issues of securities, has flooded the savings banks with deposits because of the higher dividends which those banks pay. The investment of this huge volume of recent deposits at rates which will enable the banks to maintain their customary dividends, when account is taken of the strict limitations upon such investments that are imposed by law, has proved a serious problem for the banks, and some lowering of dividend rates seems inevitable. On the other hand, if the restricted opportunities for profit in legal stocks and bonds shall induce the savings banks to lower their rates on real-estate mortgages, the building industry and the hard-pressed holders of mortgages that are falling due will be much better off for the help.

PPRIVATE CHARITY and local governments, we have been told time and again by President Hoover, must carry the full burden of relief for the unemployed. In no other way can the initiative and independence of the American people be preserved. It is a matter of record that no other city in the country has made so sincere and generous an attempt to care for its jobless as has Detroit, which spent more than \$20,000,000 on public relief in the last twelve months. The Detroit program has been carried forward under the direction of Mayor Frank Murphy despite the limitations put upon it by dwindling tax receipts and a growing deficit. Now, however, Detroit confesses that it has failed; the load has been too heavy. The City Council has already voted, having overridden the mayor's veto, to close the municipal lodging-houses, in which from two to four thousand men have been sheltered every night; and it is seriously considering a proposal to limit the total of family-relief expenditures to \$300,000 monthly. Last winter food, clothing, medical attention, and in many cases rent money were provided for more than 40,000 families. The average monthly outlay per family was \$40, and this small sum only too often proved inadequate. If the council's plan carries and conditions in Detroit do not improve, the city will have next winter an average of only \$7.50 a month to spend on its destitute families. Does Mr. Hoover really believe that the spirit of self-help and self-government can be kept alive on \$7.50 a month, to say nothing of the difficulty of keeping a normal American family alive on that inadequate amount?

THAT WE ARE MOVING measurably closer to redemption of our long-neglected promise of independence to the Philippines is indicated by the unusual interest in the question displayed by Congressmen this summer. Indeed, recent developments have led Senator Bingham of Connecticut "to believe that a bill granting independence to the Philippine Islands will pass both houses of Congress during the coming session." And the Scripps-Howard Newspaper Alliance has reported from Washington that President Hoover "may reverse the traditional Republican policy of opposition to Philippine independence." Others among our national legislators have been sufficiently interested to visit the islands. Senator Hawes of Missouri spent several weeks

there talking frankly, not merely with American residents and official representatives, but also with native business and political leaders. He said he would continue to work for independence, and his statement, according to reports, brought dismay only to the American colony. In addition to Senator Hawes, the islands were visited by Senators Patterson of Missouri, Robinson of Indiana, and Pittman and Oddie of Nevada, and Representatives Yon of Florida, Gibson of Vermont, and Dowell of Iowa, while Secretary of War Hurley, whose office has administrative jurisdiction over the islands, is planning a trip to the Philippines later in the summer. We sincerely hope that Senator Bingham is correct in his prediction of favorable Congressional action, but we cannot hold with him in his hope that the President "will veto any such measure." The United States has all too long and all too shamelessly withheld fulfilment of its pledge to the Filipinos.

THE STRUGGLE between Premier Mussolini and Pope Pius over who shall possess the minds and hearts of the youth of Italy is, for the contestants, a battle to the death. For the outsider, neither Fascist nor Catholic, it presents several interesting phases. The church, for the first time in many decades, is seen to be openly engaged in political controversy. It has come down from its sacrosanct throne and animadverts on capital and labor, on socialism, on birth control, on the several rights and privileges of the temporal and the spiritual powers. It restates, probably with some unwisdom, that the obligations of the true Catholic are unyielding and definable. The oath of allegiance taken to the state must be made with reservations, and "one is not Catholic except in baptism and name if one adopts and pursues a program which contains doctrines and maxims . . . contrary to the rights of the church of Jesus Christ." There will be many for whom such doctrine will weaken the position of the church. Mussolini, on the other hand, may very well fear outspoken criticism from any source. When the king in the proverb marched unclothed and his loyal subjects had faith that he wore royal robes, all was well; but the doubt of a child who watched broke the spell. Loyal Catholics may well rally to the Pope's standard now. And thousands who are not Catholics but who have endured the weight of the Fascist hand may breathe more freely and rejoice that others are ready to question the hitherto undisputed authority of Mussolini's rule.

IT IS GOOD NEWS that the peace caravan dispatched from the Pacific to the Atlantic Ocean by the Disarmament Campaign Committee of the Women's International League for Peace and Freedom is meeting with surprising success and enthusiasm in its effort to roll up signatures for the great disarmament petition which is to go first to President Hoover and then to the disarmament conference. At Santa Barbara the mayor greeted the crusaders and signed the petition and so did the mayors of several other cities. At San Francisco the mayor publicly received the crusaders in front of the City Hall, with the city's band enlivening the proceedings. "We are traveling on faith," writes Katherine Devereux Blake, one of the leaders, "but we get bigger collections than those I remember in suffrage days"—which is remarkable, indeed, if one recalls the stringency of the times. We heartily admire the pluck of those who are

striving thus to dramatize the coming disarmament conference. It is of the utmost importance to the United States and to the world that a great victory for disarmament be achieved in Geneva. The cutting of the cost of armaments will go far toward reestablishing the trade and prosperity of the world, to say nothing of the moral and spiritual benefits to be obtained. We wish that there might be a hundred such peace caravans under way this summer.

BENJAMIN N. CARDOZO, chief judge of the New York Court of Appeals and therefore the highest judicial officer in the Empire State, is by this time so accustomed to receiving medals and distinctions of every kind that one more or less can hardly thrill him profoundly. None the less, we must be permitted to express our gratification that a Roosevelt medal has now been conferred upon this singularly able and modest jurist, justly described in the award as "a scholar of immeasurable attainments, a lawyer of unbounded legal erudition, the very embodiment of impartiality, fairness, and justice." In an hour when the courts are more and more coming into disrepute, when disbelief in the possibility of a poor man's obtaining justice steadily grows, it is encouraging to look to Justice Cardozo as typifying the best that there is in the legal profession and as giving the assurance that the States as well as the federal government can have the finest kind of bench if only they will eliminate politics and seek men who have the respect and admiration of their professional associates. And while we are on the subject of a June honor, we must also record our satisfaction that the University of Wisconsin has conferred an honorary doctorate of laws upon Harry F. Ward especially because he, as chairman of the American Civil Liberties Union, has "valiantly defended those basic rights of free speech, free press, and free association without which neither scientific advance nor social progress is possible."

"COUNTRIES, oceans, and civilizations have been slipping past us so fast in this journey of a little more than a week that things aren't straight in our minds yet." Thus poignantly did the two world fliers, Post and Gatty, describe their eight-day trip. Countries, oceans, and civilizations were left behind them, not only under the rush of their plane but in the minds of men who waited to hear how they would fare and whether or not they would safely land. The days of travel on foot slipped past them, and of patient oxen; of three months to cross the Atlantic; of the laborious, months-long trek from Ohio to Oregon; the infant railroad, puffing its twelve miles an hour, the callow automobile, enduring the derisive shrieks of children as it increased its speed to ten minutes for a mile, the young airplane modestly proceeding half a mile in sixty seconds—all these were forever left behind. Fifteen thousand miles in a little over eight days and a half is the new record. It will be bettered, of course, but it is an arrow that points a new age. It makes the world smaller than our fathers ever dreamed it could be. It does another thing: it destroys certain distinctions. Mr. Post was asked how it felt to fly over Siberia. "Just the same as anywhere else," he answered, "like flying over Oklahoma." When Siberia becomes indistinguishable from Oklahoma, long-cherished boundaries, national differences, the bitter animosities that divide nation from nation seem somehow trivial and outworn.

The Triumph of the Hoover Plan

THAT the French would fight for face-saving terms was to have been expected; that is in part due to their mental habits, in part to the exigencies of their political situation. It was not in the nature of things as easy for them to swallow innumerable spoken words affirming that France never, never would consent to any alterations of the Young Plan as it was for Mr. Hoover completely to reverse himself within ten days. Yet, thanks to the skill, patience, and firmness with which negotiations were carried on in Washington and by our representatives in Paris, a great victory was achieved. The French have yielded, perhaps as gracefully as possible, and have practically accepted Mr. Hoover's terms as handed to them, with certain slight alterations that do not affect in any way the carrying out of the original Hoover plan. For this we again offer our warmest congratulations to the President. While we are well aware that self-interest played some part in his reaching a decision, it is none the less a praiseworthy achievement and may well mean, if followed up by other equally drastic measures, the rescuing of the world from the economic morass in which it was steadily sinking.

That in the end a satisfactory settlement would be arrived at we have never doubted. France might struggle as it pleased, but it could not afford to be in the position of being the sole Power to block a scheme which has not only been accepted by the entire world, but has already been put into effect by Italy, with respect to her own debtors, without waiting for the formal ratification, and has already called forth Chancellor Brüning's voluntary pledge that not one cent of the moneys gained by Germany will be applied to increased armaments. France's hesitancy and quibbling have, however, done that country no good, and it will be fortunate, indeed, if its conduct in this matter is not utilized by other Powers to plan a campaign at once to isolate it at the disarmament conference.

The truth is, we suppose, that France, having suffered less than any other nation from the economic crisis, is less able to understand the dire necessity of others. None the less, French diplomats and cabinet ministers must have known as well as Mr. Hoover that the crisis was at hand in Germany, that the Reichsbank was gravely endangered, that the whole of Central Europe was in imminent danger of financial collapse, with chaos, perhaps even anarchy, the inevitable outcome. When the whole house is falling down, it is no time to split hairs, not even if the dweller in one apartment thinks that his residence is safe and that he may even be able to pick up out of the wreckage some of his neighbor's possessions that he has long coveted. It is only a few months since a foremost British statesman declared unequivocally in private conversation that if Germany went down, England would collapse, too. What is true of England is true of France. Economic chaos, starvation, and misery in Germany would menace the peace and happiness of France to an irresistible degree. Moreover, the latest news from Germany, with its report that the run on the Reichsbank continues, that a gold credit of fifty million dollars in New York has been absorbed and half the credit

already placed at its disposal under the Hoover plan, shows that this grave emergency has not yet been passed and makes the French hesitancy and delay even more difficult to understand.

We see little objection to the concessions thus far made to France. As the American statement of July 1 pointed out, the important points are, first, that France has agreed to forego the retention of any payments from Germany for one year, and, second, that the principle of continuity of payment of unconditional annuities is recognized (for face-saving purposes), while complete relief to Germany is afforded. There is certainly no valid objection to the proposal that during the moratorium year the annual contribution of 660,000,000 marks by the German railway companies shall continue to be deposited with the Bank for International Settlements, and that the balance of 612,000,000 marks left of it after service of the 1930 German international loan shall be reloaned at once to the German railways. Naturally the United States could not accept a proposal that 100,000,000 marks of the unconditional payments paid in to the B. I. S. should be made available for loans to Central European countries other than Germany. Mr. Hoover has rightly insisted that the moratorium should be a real moratorium, and not one vitiated by a number of exceptions.

Now that the French have finally swung into line, we would earnestly urge upon President Hoover the immediate calling of Congress in extra session, not later than October 1. We are well aware of his disinclination to have Congress on his hands, lest it legislate on unemployment and other domestic issues. We are aware, too, of the widespread report that Mr. Hoover will call Congress two weeks in advance of its regular meeting in December. That is not, however, early enough. There are grave dangers in allowing more than four months to elapse between a moratorium agreement between the Executive and foreign Powers, and its submission to Congress for approval. While Mr. Hoover has been wise enough to sound out all available Republican and Democratic Congressmen and Senators, the response was not unanimous, and there is a possibility of serious opposition developing prior to the regular reconvening of Congress.

After the first flush of the psychological effect of this move has passed away, and it becomes evident that what has been obtained is only a breathing spell, that the grave situation of Europe cannot be altered merely by a year's delay, but that the numerous other causes of the worst economic crisis in modern times must also be removed, there may be an increasing feeling of doubt. No one can tell what may happen this summer. The time to strike is now while the iron is hot, when Mr. Hoover can surely count upon Congress. Delay until December will cause unrest and anxiety in Europe, which has not forgotten that Congress in its wisdom rejected the Treaty of Versailles after it had been enthusiastically recommended by the war-time President. Let us have the issue settled now, if only because other important settlements and changes will demand attention as soon as this act of the Executive is ratified.

Death of a Commission

ON midnight of June 30 the Wickersham Commission, sometimes known as the Commission on Law Observance and Enforcement, passed almost stealthily out of existence, without ceremony and without even a final meeting. It would not be possible or entirely fair to render at this moment a final verdict upon its achievements. Its various studies on police methods, probation, crime costs, crime causes, crime among the foreign-born, and "the lawlessness of the law" have not yet been made public. Some of these reports may prove to be substantial contributions, and a few of the commission's recommendations in this field may conceivably be acted upon. But any consideration of the commission's record available up to now is bound to be a depressing one.

The Commission on Law Enforcement, it must be remembered, is the most famous of all the President's commissions. Even before he took office Mr. Hoover put forward the appointment of commissions as the master-method of solving and settling the problems of government. It took such problems "out of politics." It took them out of the realm of passion and partisanship and placed them in the hands of experts. It was preeminently the "scientific" method of dealing with them. The record of the Wickersham Commission may be taken as typical of what the method of solution-by-commission may fairly be expected to achieve.

What happened to it? Almost immediately after its appointment it became in the popular eye, and even apparently in its own eye, the commission on prohibition. Its proceedings were then surrounded by a curious sort of peep-show privacy. It was not many months before Chairman Wickersham was giving out public statements and writing letters regarding his personal attitude on prohibition. Finally, after a year and a half of this wouldn't-you-like-to-know-what-we're-going-to-say attitude, the commission's report was published. After a year and a half of "fact-finding," it published no facts on prohibition not already known in their broader aspects by nearly everyone. Far from clarifying anything, the recommendations made the situation more confused than ever. The 800-word summary of the report said one thing, the complete report something rather different, and the statements signed by individual members something quite different. The summary stated, for example, that "the commission is of opinion that there is yet no adequate observance or enforcement," which was hardly an adequate summary of the statement in the complete report that "a majority of the citizens in most of our larger cities" and "at least a very large number of respectable citizens in all communities" were drinking "in quite frank disregard of the declared policy of the national prohibition act," despite the fact that "no other federal law has had such elaborate State and federal enforcing machinery put behind it," and that "after a brief period in the first years of the amendment there has been a steady increase in drinking." The summary asserted that "the commission is opposed to the federal or State governments, as such, going into the liquor business," but carefully refrained from mentioning that several of the commissioners had approved the creation of officially author-

ized agencies for the distribution of liquor in States which approved such distribution. The summary declared, without qualification, that "the commission is opposed to the repeal of the Eighteenth Amendment." It did not state that two of the eleven members of the commission were in favor of outright repeal, and that five others wanted immediate modification. The individual statements of the members showed various degrees of inconsistency with their signatures to the main report. The palm went to Mr. Baker, who signed the report opposing repeal, while stating categorically that he favored repeal.

What did Mr. Hoover do with this report? He vaguely "commended" certain of the minor suggestions "to the attention of the Congress at an appropriate time"—though he did not specify what time would be appropriate. He repudiated, however, the only really important change the commission had been able to agree upon—that altering the present mandatory prohibition amendment into a merely empowering amendment—by asserting that he saw "serious objections" to it. He did not specify what the objections were.

The history of the Wickersham Commission therefore comes down to this: In appointing it, the President called for "an accurate examination of fact and cause" to be followed by "constructive, courageous conclusions." In the report on which the commission spent the most of its time, no facts were found that altered what was generally known. There was virtually a different conclusion from each member of the commission. The summary of the report was not an honest reflection of the opinions of the individual members, and the most important recommendation even of that summary was rejected by the President who had appointed the commission. Congress, of course, did nothing. Let us keep these facts in mind when the next commission is appointed to solve—or evade—the next issue.

Haiti Still a Problem

GROWING impatience on the one side and literal-minded stubbornness on the other threaten, unless common sense is soon brought to bear on the situation, to make a tragedy of the Washington Administration's expressed desire to end the American occupation of Haiti. It was more than a year ago that the Forbes Commission, complying with the instructions of President Hoover to determine "when and how we are to withdraw" from Haiti, made several specific recommendations. It urged that the government be reorganized by substituting parliamentary rule for the dictatorship of President Luis Borno and his extra-legal Council of State, that the general of marines acting as High Commissioner be replaced by a civilian Minister, that the marines be "gradually withdrawn," and that a policy be adopted "providing for an increasingly rapid Haitianization of the services, with the object of having Haitians experienced in every department of the government ready to take over full responsibility at the expiration of the existing treaty." The first two steps of this program, which was approved by Mr. Hoover, have already been taken. Beyond that there has been little progress; marines are still in Haiti and Americans continue to hold most of

the high government offices. As a result trouble is again brewing.

Storm signals have been noted by several observers, among them Ernest Gruening, editor of the *Portland Evening News*, and Harold Denny, *New York Times* correspondent, who have recently visited the Caribbean republic. They report that the Haitian patriots, meaning the majority of the people who since 1915 have been chafing under the restrictions of the treaty imposed upon them in that year, are extremely impatient to have the occupation ended without further ado. They have always held the treaty to be invalid, and now, in view of the Forbes Commission's recommendations, they assume that even Washington admits the occupation to be illegal, and so they see no good reason for haggling over the terms of the withdrawal. Moreover, the patriots are being egged on by the press, which is constantly demanding immediate withdrawal, and by leading Haitian politicians, most of whom have seats in the national assembly, and all of whom are looking forward with eager anticipation to the fruits of office they will enjoy once the Americans have got out. A few of the more prominent cabinet officers, including President Stenio Vincent, appreciate the necessity for patience and peace during the period of withdrawal, but they too believe the task can be completed in a relatively short time.

On the other hand, the American occupation officials appear to the observers to be obsessed with the desire to abide strictly by the letter of the Forbes Commission program rather than by its very liberal spirit. The commission itself found that "the acts and attitude of the treaty officials gave . . . the impression that they had been based upon the assumption that the occupation would continue indefinitely." Now that these officials know they must give up their jobs and get out they are, in the opinion of the Haitians, quibbling over unessential details. The Americans, to all appearances, are just as eager to hang on to their jobs as the Haitian politicians are to appropriate them. The new American Minister, Dana Munro, who with Pauleus Sannon, Haitian Foreign Secretary, has been negotiating an agreement to govern the Haitianization of the government services, thus finds himself under pressure from two sides.

But in concerning ourselves too much with Haitian political ambitions and with the petty details of the withdrawal, we are apt to overlook the larger problem involved. Now that we have recognized the error of our intervention in the first place, we ought to get out without standing upon formality or ceremony. Perhaps this course would do violence to our notion that the Haitian leaders are not yet so well qualified to rule their country as are the American experts sent down there for that purpose, ignorant as the latter are of the language and psychology of the people, and perhaps an abrupt departure would not be strictly legal or regular as the State Department sees it. But only by such a straightforward and honest course can we begin to right the wrongs we have done the Haitians these last sixteen years. Our present insistence upon precise observance of every detail of the withdrawal program is only filling the Haitians with still more resentment against us. One of their editors, Ernest Chauvet, has already warned us that in the present situation there is an "acute possibility of serious disorder." It would be a pity if such were the result of the visit of our well-intentioned Forbes Commission.

Literature and Affairs

FROM the office of Senator Norris has just come a statement made by Theodore Dreiser to Paul S. Clapp, managing director of the National Electric Light Association. It was Mr. Clapp who, in answer to Senator Norris's strictures on the Power Trust, declared indignantly that no such animal existed. Mr. Dreiser does not believe it, and his reply is well informed and ably written. Nor is this by any means the first time he has taken part in public controversy. Lately, in the case of eight Negro boys sentenced to die for rape in Scottsboro, Alabama, he was an active member of a committee of protest; and he has made one of another committee of writers to hold hearings on cases of alleged brutalities perpetrated on miners by mine guards in western Pennsylvania.

Mr. Dreiser thus is carrying on a tradition much neglected in America of late years, that an artist need not disassociate himself from public affairs, but may, if his temperament permits, hold office, criticize public men, and in general take part in the life about him without injury to his art. John Milton spent his middle years as secretary of foreign tongues to Cromwell's Council of State, and was prolific and passionate in his writings on current affairs; the author of "Tom Jones" as Mr. Justice Fielding dispensed justice for many years from the King's bench; Dean Swift, not over-busy with his duties at St. Patrick's, had before assuming them tasked his spirit and his pen in ardent political advocacy. There are many writers to whom this sort of occupation would be unthinkable. For them the ivory tower in which they can contemplate life without letting it destroy them. If Mr. Dreiser, as one of America's first novelists, can be partisan in the lives of men and women around him, Mr. Robinson Jeffers, one of America's first poets, has built himself a stone tower by the Pacific and retreats to it at the first approach of insistent sociability. These two happen to be honest men, honestly behaving as their own natures compel them to behave. From the character of his writing, so deeply and persistently concerned with every small detail of living, Mr. Dreiser might well be expected to watch with interest what goes on in the world about him. Mr. Jeffers, to whom the world is one vast magnificent metaphor, and the men and women in it whirling shapes bent by fate to fill it, can properly enough let politics and economics take care of themselves while he occupies himself with writing poetry.

This, of course, is very unpopular doctrine with our young "proletarian" writers. For them the current scene is everything, the current injustices of the capitalist system are the only matters with which an honest writer can concern himself. They are not individualists, they will not grant any man the right to be different from his fellows, or to wish to be apart from them. They love Upton Sinclair, not because he has written patiently and interestingly of contemporary America, but because he is on the side of the workingman; they will love Mr. Dreiser for the same reason. In America today there is much to observe, much to champion, much to fight and abhor—for the writer whose taste urges him to take sides as well as to watch. This is an excellent way of writing. One should not, however, make the mistake of thinking it the only way.

A Man Can Be Free*

I

By ROMAIN ROLLAND

YOU have both written in a friendly spirit. I thank you. You know, as I hope all your brothers in the Soviet Union know, that I am your sincere friend and a defender of the Soviet Union in the West. I have welcomed your young revolution from the moment of its birth in 1917, and from the beginning I have untiringly defended it with my pen against those who have attacked and misrepresented it. Just a few days ago I mercilessly tore the hypocritical mask from the face of the "Pan-Europeans." I believe in the Soviet Union and will continue to support it to my last breath. Therefore there is every reason for peace between us, and we should rejoice in this.

But you have found it necessary to become alarmed and perturbed because I consider myself an individualist, and because I harbor a "love for humanity." My dear friends, accept me as I am. Whether I am mistaken or not, at least I am sincere and honest. And in my honesty lies my strength. Yes, I believe in humanity. And this individualist, this "believer in humanity" is fighting your battle. Instead of saying, "No, this cannot be!" would it not be wiser to rejoice because the Soviet Union has on its side the most ardent champions of individualism and humanity?

You say, my dear Selvinsky, that individual freedom does not exist and that an "intellectual" has never been free and never can be free. My whole life is an example of the contrary. I have lived as a free man. Amidst my enemies, as amidst everything I have loved, through all that I have fought for, through all that I have been and stood for, I have always remained free. And for this freedom I have paid a high price, the price of living in the absolute seclusion of my own thoughts, surrounded by an atmosphere of violent hatred. I shall not dwell on the hardships this condition has brought upon me, hardships made particularly unendurable by my sensitiveness. For I have never been tempted to make a profession of heartlessness. I have loved and wanted to be loved in return. But I have sacrificed everything—happiness, ambition, and material well-being—in order to remain free. And I have succeeded in remaining free—free and alone during all these years of my life. I have stood alone among the herd of Western intellectuals, whose proud dogmas and egotistical prejudices I have never been able to share, alone in my native country, with its nationalism, against which I have fought; I stood alone in 1914, when I unmasked all that was behind the fratricidal war. And I have stood still more completely alone since the signing of the peace treaty, this false peace of robbers, which I have unceasingly attacked and denounced. And alone, with a very small group of persons who think as I do, I stand in the West for the defense of the Soviet Union. So do not say that one cannot be free. One is free when one has enough courage to sacrifice everything for the freedom of one's soul.

And now we come to love for humanity, which, in your opinion, Feodor Gladkov, it is ridiculous even to mention, in these days of brutal and savage upheaval. In my opinion this is precisely the moment to speak of it. Love for humanity has become a standard around which we should rally, at this time of conflict when there is danger of its being trampled under foot. I am doing what I can to rescue it from destruction by people who are savagely fighting one another. You can trample upon me if you wish. . . . Surely when it comes to proclaiming the hypocrisy of "lovers of humanity" and of "peace," we are at one. And who has struggled more tirelessly and attacked this hypocrisy more severely than I, the author of "Liluli"? But hypocrites we shall find at all times and everywhere, and in every camp. Those are the jackals that follow the lions in order to eat their leavings, and put an end to them if they should happen to become ill or wounded. Do not confuse them with the lions. And do not confuse noble individualism, that believes it "better to die than to betray your convictions," with low egotism, that thinks of nothing but how to fill its stomach and satisfy its ambitions and interests. Do not confuse the false love for humanity of the Tartuffes who grow fat on the peace treaty and the international bureau of disarmament with the ardent flame of love and sacrifice that burns in the name of freedom, and that seeks to elevate and enlighten the oppressed and exploited masses of humanity—this same flame that lives within you.

For in your country, my friends of the Soviet Union, consciousness and appreciation of life are free. And you yourselves, not realizing this, are true individualists, true apostles and ardent servants of humanity. Can you not realize that? I am bringing to you, into the camp of workers who have become masters of their own destiny, the sacred banner of freedom of spirit and love for humanity. Do not be so blind as to reject it. Be proud of it! Rejoice that we are fighting in your ranks. Do you remember in Shakespeare's amazing work, "Antony and Cleopatra," the eve of the great battle that was to decide the destiny of the world, and that was to give the power into the hands of Octavius? Mysterious music is heard on the night air; the sound of flutes floats over Antony's camp, and singing from an invisible parade is heard, gradually fading away and dying out. That is the march of Dionysus, and it is Antony's gods who are abandoning him. They are abandoning the one who is doomed to die. . . . The gods of the old world, individualism and humanity, are fleeing from the camp of your enemies, and they are coming to your camp. Accept them. And accept the hand of one who leads them. This hand is experienced in the battles of a whole lifetime. And this hand is firm. And it presses your hand.

II

By A. V. LUNACHARSKY

I must ask your forgiveness, my friends Selvinsky and Gladkov. For in this controversy I am nearer to the point of view of Romain Rolland than to yours. And I consider myself none the less Marxian for that.

* A letter from Romain Rolland to Feodor Gladkov and Ilya Selvinsky, published in the *Literaturnaya Gazeta* of Moscow and translated from the Russian by Lubov Meiller and Harold Ballou, together with a letter by A. V. Lunacharsky simultaneously published in the same review and also translated by Miss Meiller and Mr. Ballou.—EDITOR THE NATION.

One might easily understand from Romain Rolland's letter that you have accused him of being an individualist and a "servant of humanity," but that in reality there exists no such thing as individual freedom, nor any such thing as love for humanity. One is forced to conclude from Rolland's letter that you think there are only social restrictions, which are borne by the classes. This accusation sounds orthodox, but you will pardon my saying that it is somewhat superficial. In reality, if we consider a true proletarian, it is evident that the freedom of his activities and of his class should naturally coincide.

What is individual freedom? In this case our point of view is Hegelian, invariably resting on a dialectical-materialistic foundation. A free man is a person whose behavior coincides with the very essence of his being. If my freedom did not correspond with my character, it would be a strange situation indeed! Free actions must correspond with one's convictions and feelings. (A proletarian's freedom, by the way, may be hindered through his backwardness and his lack of education. Therefore when a proletarian becomes enlightened through education, he discovers and broadens his true self. His personality becomes freer, at the same time still belonging to his class. The party discipline, which he accepts, is as the very air which he breathes. The more disciplined a member of the party, the freer he is.)

Now let us consider the individuality of the intelligentsia. This is not only a merely bourgeois individuality, but also an individuality that spends itself in perfecting its own being. . . . Originality, for a writer, lawyer, doctor, painter, engineer, or other intellectual is the greatest gift that he can possess. . . . And in precisely this lies his talent. There also exists among the intellectuals a competition in originality. In the process of development of this competition the intellectual suffers purely personal complications. . . . An intellectual thinks that his "sensitiveness" is a sign of highly developed individuality. But this is just as false as to consider as a quality the noises made by an expensive automobile while in motion. . . .

There are many threads that bind an intellectual, especially a European intellectual, to his bourgeois environment. . . . How can such an intellectual (and in Europe 99 per cent are of this type) tear himself away from such a situation and approach the proletarian? I can assure you that he can do it only through the development of the greatest individual freedom. . . .

Let us suppose that the intellectual does not at once find the communistic road. This will still be his first honest refusal to serve the bourgeois idols—to oppose them through his desire to be truthful to himself. This alone will bring our "Doctor Stockman" into conflict with the society in which he lives. It may take him some time to discover that there exists a society that will support him in his convictions, a society in which he will have a chance to develop, namely, the revolutionary proletariat. But in the beginning he will suffer from a deep feeling of loneliness. He will come to the conclusion that outside of this society there are many other spheres, some good and some bad, in which he can spend himself, but the essential thing is that at last he is developing his true individuality. This culmination, which calls for sacrifice, brings him to the summit of his self-esteem. . . .

So how can Romain Rolland help being proud of such

individualism? How can he refrain from speaking of freedom as of something truly noble? Now tell me, friends Gladkov and Selvinsky: if Romain Rolland did not believe in individual freedom, would he not be forced to believe the alternative, that a man can only express the interests of his class and no more? In this case he would be forced to remain, according to Pereversev, within the frame of his class, forever a bourgeois. And Romain Rolland does not want that.

Lenin has said that everyone has his own way of arriving at communism. Thus the road of an intellectual leads through highly moral social individualism and scientific freedom of thought. And this requires a strong character.

It is a road to freedom through freedom, the highest type one can attain. This freedom is no longer individualistic, because it harmoniously coincides with the requirements of the class. Romain Rolland, with a somewhat ironical smile, tells Gladkov and Selvinsky that Communists, not themselves realizing it, are "true individualists." This is not true, my friend. We Communists are great individualists, fully aware of it. And you, our friend, you fully understand our individualism. . . . Individualism grows to a colossal stature when it works hand in hand with the great social movement of its time. . . .

We are well aware that our struggle produces tremendous individualities. Surely we would laugh to scorn any person who tried to maintain that Marx, Lenin, or Stalin were not very outstanding individualities. We also know that the socialistic order will create varied and strong personalities, although there will be no conflict or competition between them over a career, which some bourgeois consider a necessary condition for individualism.

The same misunderstanding arises when we come to consider love for humanity. From Romain Rolland's letter it is evident that he despises scoundrels and fools who want to hide the class struggle from the new humanity. No, there does not exist at the present time an undivided humanity. There is a gigantic class struggle between two consciously hostile camps, the camp of the leaders of the bourgeoisie and their lackeys, and the camp of the proletariat and their followers. Lenin pointed out more than once that with the natural development of sharper class conflicts there will gather around the banner of communism hundreds of millions of men, and around the flag of capitalism there will remain a small group of exploiters and their servants. In this respect we speak in the name of humanity. We only deny the exploiters the right to be considered as a part of humanity, for they are its enemies. And they must be liquidated as a class. Socialism will lead to the annihilation of classes, and thus to the complete realization of humanity.

We do not have to build up contradictions between such people as Romain Rolland and ourselves. . . . My dear friend, we love your personality which is so distinctly different from that of the intellectuals you have described in "Liluli." We welcome your freedom, which permitted you to protest proudly against the idols of European public opinion. We know that you want to serve humanity. We know that you are beginning to absorb completely the truth, that one can serve humanity only by giving oneself wholly to the proletariat through its revolutionary, communistic vanguard.

Graustark Gets Down to Figures

By JOHN GUNTHER

JUST a year ago this week King Carol flew back to Rumania an exiled prince, dishonored, outlawed, scandal-pelted by a brace of continents. He stepped by night from a hard-flying airplane to assume a throne held previously by both his father and his son. Once he was pretty close to being a fugitive. Now he is pretty close to personal responsibility for 17,000,000 Rumanians. This sounds romantic, but today Carol is facing critical realities. The details of his coup outdid Hollywood—the decoy whereby the Rumanian spies were foiled, the conspirator in false mustachios who impersonated Carol in a Paris hotel, the code telegrams signed “Sophie,” the night flight across the Carpathians. Very pretty it all was! Today Carol holds his head over problems of grain export, trade balances, budget deficits. Graustark is getting down to figures.

Carol is not a dictator—yet. The plain truth of the matter is that he has no need to be. His personal government serves the same purpose, with less ostentation and risk; his cabinet of three cronies and a half-dozen non-party specialists gives him a properly constitutional executive committee; and his parliament, more or less hand-picked by the elections of June 1-4, provides a convenient and outwardly irreproachable façade. These are bad days for unconstitutional kings, and Carol knows what happened to Alfonso. Moreover, his brother-in-law, Alexander, across the border in Jugoslavia, has not had an easy time.

Just the same, Carol intends holding as close to actual as well as titular power as possible. This was the purpose of the elections, which were a pretty neat job, even for Rumania. It is, of course, a historical fact that no government in Rumania has ever lost an election. Governments go out not by vote of parliament but by royal decree, and the new government is formed specifically with the intention of holding elections and thus confirming itself in power. But the new government of Professor Jorga chosen by King Carol had only one seat in parliament, that of Professor Jorga himself. So a party of exactly one had to be transformed into one big enough to swing a chamber of 387. It was done by an electoral pact with the Liberals—the party which hounded Carol from the country. Strange bed-fellows! But cooperation with the Liberals was the price that Carol was willing to pay to avoid an overt dictatorship.

The Carol-Jorga-Liberal bloc polled 1,389,894 votes out of 2,100,000, and got 289 seats in the chamber. The National Peasant opposition, which polled 2,200,000 votes in 1928, dropped to 438,761, and was reduced in parliament from 324 seats to 30. Obviously such a terrific swing of the pendulum shows that once again in Rumania the elections were “made.”

The turnover was effected in perfectly orthodox Balkan fashion. About 10,000 opposition votes were “lost,” and are still missing. In some districts voters were warded from the polls by sudden quarantines, to protect them from mysteriously arising “epidemics.” Fraud and intimidation kept thousands from the polls. In Bucharest only 26 per cent of the electorate voted, and in the country as a whole only

50 per cent. Moreover, by the terms of a convenient electoral law which may surprise Westerners, but which is common in the Balkans, the government on getting 40 per cent of the total poll takes a 30 per cent bonus of extra seats in the chamber. So “democracy” protects itself.

Even so, the victory of Carol’s personal government was not so sweeping as it might have been. The Jorga group has, it is true, 289 seats out of 387; but 80 of the 289 are promised to the Liberals, and 18 to minority parties. If these should secede from the government bloc the majority would be precariously reduced. The Liberal leader, a hard-boiled politician named Duca, may make trouble. But Carol is so certain to put the screws on recalcitrant politicians that it is unlikely. Everyone remembers what happened to poor M. Titulescu, Carol’s minister in London. Titulescu worked night and day for thirteen days before the present crisis to form a government, and twice he very nearly succeeded. Carol put him to the all but insuperably difficult task, first, of getting the nauseous welter of minor politicians to work together, and, second, of effecting a reconciliation between the Liberals and their bitter enemies, the National Peasants. Titulescu sweated, but he did it. But when he finally presented his cabinet the king brusquely refused to accept it, on the ground that it did not include his personal friend Dr. Argetoianu. Then through Professor Jorga a cabinet was formed almost within an hour. Titulescu is described as much hurt still at the truly horrible way he was let down.

Carol aside, the three men who run Rumania under the present regime form an amusingly variegated trinity. Professor Jorga was professor of universal history at the University of Bucharest at the age of twenty-two. He sits in a little house on a Bucharest boulevard, roars orders to secretaries through a glistening black beard, has the temper of a Tartar, has written 357 different books and pamphlets, and when I saw him was answering all complaints and petitions from all parts of the country personally. He is also completely honest. This is a handicap to a Rumanian politician.

Dr. Constantine Argetoianu is a doctor of medicine, a successful banker, a politician who has led several different parties, and an advocate of dictatorship. He is both Minister of Finance and Minister of the Interior, and it was he who managed the elections. The third man, Mihai Manoilescu, is a typical Balkan character—an economist who is also an *agent provocateur*, an authority on public finance who had enough knack for political conspiracy, to say nothing of aviation, to organize and engineer the plot that brought Carol home. Once he was arrested by the Bratianus for running messages to Carol in exile. He is Minister of Trade and Commerce, and the closest man to the king in Rumania.

The National Peasants, isolated in opposition under their Jesuit-trained leader Dr. Julius Maniu, are blistering sore at the way they have been out-manuevered—and, at the moment, are absolutely impotent. All they can make is

■ lot of noise. They will. Their prestige in the country has dwindled greatly, though not of course so greatly as the elections indicate. They made promises they found it impossible to fulfil; the two groups within the party, the Transylvanians and the Czaraniists, began to squabble; after thirty months of office the people were ready for ■ change. Moreover, Carol and Maniu quarreled. It was Maniu's government which made Carol king, and kings do not like to be too much indebted to their own subjects. Carol was bored by being grateful to Maniu. Again, Maniu fought with Carol over the position of Helen, the unhappy woman who is daughter, sister, mother, and ex-wife of kings, but not ■ queen.

One should note briefly some of the positive achievements of Maniu and his party in their term of office. First and most important of all, they ended the vicious Bratianu tyranny. They took office saddled with ■ deficit of 18,000,000,000 lei (\$1 equals 166 lei) and got ■ foreign loan just the same. They tried to reorganize the railroads; they sought to decentralize the administration; they promoted essential government economies. The Finance Minister, Dr. Madgearu, issued a series of decrees which swept through the rotten fabric of Rumanian finance like wind from the pines. The currency was stabilized; income-tax defaulters were corraled; and a law mercifully reduced the interest rate to 14 per cent. *Fourteen*, you say? Yes, because in Rumania rates of 35 per cent or even 50 per cent are common.

There have been rumors lately that Carol intends to marry Mme Lupescu, his famous red-haired friend. This is highly dubious. Carol once gave up his country for this woman, it was written recently, but now it appears he is giving up the woman for the country. The violent and fantastic confusions of his personal life seem quieting down. Just the same, there has been no reconciliation with Helen, his divorced wife, and none is likely. Helen will doubtless leave the country soon. With Carol will stay young Michael, the only personage in history who has been king of a country once, and who will presumably be king of the same country again. Carol and his mother, Marie, get along none too well, and her visits to Bucharest are becoming increasingly infrequent.

Rumania is 80 per cent agricultural. In Bucharest kings come and kings go; scandals flourish and administrations collapse; politicians scamper, cluster, and depart; and the problem of 13,600,000 peasants remains. A land reform which did almost as much evil as good gave 85 per cent of the land to small peasant owners. They had little machinery and little capital, and usurious money-lenders sucked out of them the highest interest rates in Europe. This incidentally accounts for much of the anti-Semitism in Rumania, the money-lenders being mostly Jews. Year after year the peasants mortgaged their holdings, until at present the agricultural debt is colossal. It has been calculated at ninety billion lei, ■ sum three times the total national budget.

On this land grain grows. It is grain which gives life to the land. And it is this same grain rotting in elevators which may give death to it. The world agrarian crisis has hit Rumania especially hard; as prices fell, taxes soared, and cheap Russian wheat hit the Black Sea markets. The country produces, but it cannot sell. The surplus this year is 250,000 metric tons of wheat, 400,000 of barley,

500,000 of corn. The total surplus, including left-over grain from the last three harvests, runs close to 2,000,000 metric tons. And Rumania all but smothers under it.

Here enters a notable example of how economic decency may be sacrificed to cutthroat politics. Rumania, like Yugoslavia, is highly tempted by the projected Austro-German customs union. Politically both countries are bound to France, but economically their magnet is Germany, because Germany alone can buy their glut of grain. One of the chief results of the customs union has been to throw into sharp light this cleavage in the Balkans between French political and German economic policy. Czecho-Slovakia is the ally of Rumania and Yugoslavia within the Little Entente, but Czecho-Slovakia cannot buy enough Rumanian or Yugoslav grain to make good business. Germany can. Bucharest and Belgrade get little from Prague but the promises of eventual bayonets.

So in the first week of May ■ German delegation set out for Bucharest to sign a commercial treaty. The Germans were prepared to offer 50 per cent preference on Rumanian wheat. The treaty would have absorbed a large part of the Rumanian surplus and saved the country from acute agrarian depression and financial stringency. What happened? During the same week the Little Entente conference was holding its annual meeting. Pressure from the French and Czechs persuaded the Rumanians that ■ German delegation in Bucharest at the same time would be improper—very! The French have nothing to offer directly for Rumanian grain. (Hence the elaborate efforts of France to promote an *international* system of agrarian credits for Eastern Europe.) Nor have the Czechs. The Germans have. But so strong was the political suction exerted by M. Benes, the Czech Foreign Minister, that the German delegation, actually en route to Bucharest, was stopped and turned back at the frontier. As diplomacy, it was rude; as economics, grotesque.

Rumania is one of the richest countries on earth. It sprouts timber, oil, corn, wheat, in abundant profusion. Rumania is also one of the poorest countries on earth. Every year it has to borrow to finance its own harvest. The budget deficit is upwards of ten billion lei. Almost one-third of the budget goes, it is true, to the army, but this is the normal figure for Balkan countries. The recent French loan was a lifesaver, but Rumania paid for it through the nose. Only 78 per cent of the nominal \$52,000,000 issue was received, and the interest rate worked out to 11½ per cent. Usury in the end, it seems, gets the usurer.

But as to the revenue, where does the money go? The peasant gets 2.8 lei for a kilogram of corn (a lei is three-fifths of an American cent, remember), 3.4 lei for a kilogram of wheat. A day's work in the fields brings him 40 lei—25 cents. But a single kilogram of sugar costs him 40 lei. Where does the money go? Why is grain so cheap, and bread so dear? In waste and inefficiency, to be sure; and also in dishonesty. Rumania, latently one of the most productive countries in Europe, is smothered with a tradition of *backshesh*, befouled by grafters, and greasy with corruption. Even the National Peasant party has its smears.

However, the situation is no worse than it was last year. And it may get better. There are great hopes of Carol and his henchmen, if they stick to their word to clean house and remember that Rumania is not the inevitable

Graustark-Zenda of Europe, but a country needing common sense more than pretty uniforms. After all, it is great credit to Carol that he returned. Ciro's and Longchamps were probably ever so much more fun. He has announced that hereafter he will attend all cabinet meetings himself,

and he may take other steps bringing him to the edge of formal dictatorship. In any case, he is running the country, and the country is his personal responsibility. Its tradition of opera bouffe hampers him. And he is making it the great compliment of treating it quite seriously.

President Hoover's Record

IV. The President and Unemployment*

By ROBERT M. LA FOLLETTE

THE Administration of Herbert Hoover began on March 4, 1929, with his inspiring declaration that "the larger purpose of our economic thought should be to establish more firmly stability and security of business and employment, and thereby remove poverty still further from our borders." Although he acquiesced in the laissez faire philosophy of his immediate predecessors in office by voicing a hope that this purpose would be attained largely through the spontaneous cooperation of individuals, President Hoover added the significant pledge that his Administration would "assist and encourage these movements of collective self-help by itself cooperating with them."

For eighteen months unemployment has been spreading poverty and acute suffering through industrial and agricultural areas alike. No one yet knows when the present economic disaster will be brought to an end. The illusory prosperity and feverish optimism which marked preceding years have given way to fearful economic insecurity and to widespread despair. These eighteen months have revealed the hypocrisy of the President's pledge of cooperation toward the attainment of economic security. The Administration's efforts to attain economic security have consisted of attempts to minimize the seriousness of the depression, of bold assurances that steps which would restore prosperity were about to be taken, and of a woefully unsuccessful program to stimulate private or local agencies to undertake tasks which the Administration was determined to shirk.

The utter inadequacy of the President's plan to muddle through the depression was increasingly evident as time went on. Instead of adopting constructive measures to meet the issues confronting us, the President in his Valley Forge speech of May 30 last abandoned all pretense of economic leadership. He counseled his fellow-citizens to await with resignation and individual fortitude the day when good fortune might again bring better economic conditions. Abandoning all thought of controlling the complexities of modern economic society, he urged that we "pin our faith upon the inventiveness, the resourcefulness, the initiative of every one of us."

President Hoover entered office with a widely accepted reputation as an economic expert. For years he had indicated his interest in preventing and mitigating unemployment. After appointment by President Harding in 1921 to the chairmanship of the Conference on Unemployment, Mr. Hoover said: "There is no economic failure so terrible in its import as that of a country possessing a surplus of every

necessity of life, in which numbers, willing and anxious to work, are deprived of these necessities. It simply cannot be if our moral and economic system is to survive."

Pledges to bring about security of employment and to "abolish poverty" marked the campaign of 1928. The election of Herbert Hoover, the country was assured, would mean the adoption of constructive and aggressive measures to cope with the problem of unemployment. Three months after the inauguration these pledges were recalled to the President's mind by the head of the Iowa State Federation of Labor, who suggested that a national conference be called to consider the unemployment problem. The President replied that he "hoped that we will be able to take it up when some of the momentarily pressing problems of the Administration are out of the way." These "momentarily pressing problems" continued to dominate the President's attention down to the day on which a stock-market crash warned even the unwary that the nation's economic structure had been undermined.

President Hoover's first recognition of the situation was a reassuring statement, on October 25, 1929, that the country was still "on a sound and prosperous basis." Events soon exploded this theory, and on November 15 the President temporarily avowed a sounder view by saying that "words are not of any great importance in times of economic disturbance; it is action that counts."

Action was to proceed along five fronts. The first involved the maintenance of credit stability and of ample supplies of capital through the Federal Reserve system, a task which the long-established banking organization readily accomplished, especially since it soon became evident that the country had an over-supply rather than a shortage of capital. Other points in the program, including the revival of construction activities, the stimulation of exports, and assistance to agriculture, were defeated by more permanent Administration policies which ran in a contrary direction. The fifth point, a reduction of income taxes to reassure business, was jammed through Congress only to demonstrate the hollowness of the Administration's glib description of the depression as merely psychological.

By way of doing something more specific, the President on the same day announced that he called a series of conferences with industrial, financial, and labor leaders, not so much to meet as to "head off an emergency." The eminent gentlemen who visited the White House seemed to agree with the President that no attempt should be made to reduce wages, and pledged increased capital expenditures to maintain employment.

* The fourth of a series of articles on President Hoover's Record. The fifth, on President Hoover's Appointments, by Charles A. Beard, will appear in our next issue.—EDITOR THE NATION.

An increasing wave of unemployment soon followed, and the President again declared that it was slight in volume and that it would soon be over. On March 8, 1930, he issued his justly famous statement:

All the evidences indicate that the worst effects of the crash upon employment will have been passed within the next sixty days, with the amelioration of seasonal unemployment, the gaining strength of other forces, and the continued cooperation of the many agencies actively cooperating with the government to restore business and to relieve distress.

On June 4, 1930, the President was waited on by a delegation of bishops, bank presidents, and manufacturers, described by Mr. Amos Pinchot in *The Nation* of January 14, 1931. The President assured the delegation that they must be misinformed concerning the seriousness of the unemployment situation. In Mr. Pinchot's words:

With calm confidence he spoke of the results that were being gained through the conference he had called of great business leaders and of their fine response to his appeal not to curtail the volume of their activities. He showed us, in authoritative style, that every agency of both the federal and State governments was working at top capacity to relieve the situation. "Gentlemen," he said, "you have come six weeks too late."

Ironically enough, it was at this time that the President reached his decision to sign the Hawley-Smoot tariff bill, which contributed greatly to the almost complete ruin of our export trade.

Demands that the Administration adopt a constructive program became more and more insistent as the fall of 1930 came on. Optimistic statements and announcements of small increases in the volume of federal public works failed to conceal the growth of unemployment, and the protracted drought further enlarged the area of disorganization.

Admission that the unemployment problem had not been met came on October 17, 1930, when President Hoover announced a new series of conferences to draw up more effective plans, on the ground that "as a nation we must prevent hunger and cold to those of our people who are in honest difficulties." The immediate result was the creation of the President's Emergency Committee on Employment, with Colonel Arthur Woods as its chairman. The Woods committee collected information for the President's guidance and made suggestions to private employers and to States and municipalities of ways in which they might alleviate unemployment. The major public-works expansion program recommended to the President by the Woods committee, which would have thrown the powerful resources of the federal government into the breach and substantially reduced unemployment, never saw the light of day because of the President's opposition to legislative action and his blind faith that "the spirit of voluntary service" would be strong enough to cope with the problem "in full measure of the need."

Throughout the following session of Congress, from December, 1930, until March, 1931, the President successfully prevented enactment of more adequate measures to relieve unemployment. Federal assistance to meet the relief of actual distress was blocked through the subserviency of the leaders of a bi-partisan majority in the Senate to the influence of large income-taxpayers, and through the responsiveness of a majority in the House of Representatives to the pressure of the Administration. Instead of an emergency

public-works program upon a scale sufficiently great to reduce substantially the volume of unemployment, the Administration's emergency public-works program was limited in the main to an appropriation of \$116,000,000, most of which will be available only until September 1.

In harmony with the Administration's general attitude toward unemployment, the session ended with the President's pocket veto, based upon untenable grounds, of the Wagner employment-exchange bill, which almost alone among the measures passed by the Seventy-first Congress might have made some permanent contribution toward the alleviation of the evils of unemployment. The virtual disintegration of the Woods committee, whose members had accepted appointment in the belief that their expert knowledge would receive at least courteous attention from the President, followed within a few weeks. Although the chairman of the committee refused to comment upon his departure from Washington, one of his admirers, Edward A. Filene, remarked that "Colonel Woods is a man of action who refuses to follow a road which leads windingly or not at all to the goal."

A review of the Hoover Administration's unemployment policy demonstrates that the President has lacked either the understanding or the courage to press toward the goal of alleviating the distress of the unemployed and of reducing the number out of work. Timidity and disingenuousness have marked the course of the Administration at a time when heroic courage and bold frankness were necessary. Vigor and firm leadership have been displayed by the President at times, but only to resist proposals which would have mitigated suffering but which necessarily involved an additional levy upon wealthy income-taxpayers.

No informed person has charged the President with full responsibility for the disaster which overtook the United States in 1929. It was produced by factors which had long been working, although President Hoover, like his predecessors, lacked the vision or the will to control those forces. No one has maintained that the federal government alone could solve all the economic problems which now confront the nation. The failure of President Hoover during his Administration is revealed, however, by his attitude toward the measures which would have at least partially ameliorated the unemployment crisis, and which had been under discussion since the unemployment conference over which he presided in 1921. Some of these proposals had again been recommended only a few days before President Hoover's inauguration by the Senate Committee on Education and Labor, which under the chairmanship of Senator Couzens had carried on a thorough study of unemployment.

Instead of frankly informing the country concerning the actual state of affairs, the President repeatedly gave out misleading statements. He clung vehemently to his assertions that the depression would soon be over, and that the number of unemployed was smaller than informed observers had been led to believe.

His Cabinet members for months continued to place the number out of work at 2,000,000, even after official figures had shown the total to be far greater. Finally the Woods committee, in order to obtain a sounder basis for its own guidance, induced the Metropolitan Life Insurance Company to make an independent survey in January, 1931, which resulted in an estimate placing the number out of work at more than 5,000,000. Characteristically the Administra-

tion withheld this information until it had been demanded by a resolution of the Senate. A second and more detailed survey, conducted by the Bureau of the Census early in 1931, showed 6,050,000 persons unemployed. It too was withheld by the Administration, this time until after the adjournment of Congress had made it impossible to pass relief appropriations. Strange light is cast upon the Administration's good faith in this connection by Secretary of Commerce Lamont's announcement in March, 1931, that in accordance with a change of Administration policy the public would henceforth be given "all the facts." For more than a year, in other words, the facts had been suppressed.

Despite this assurance, unwarranted optimism continues to emanate from the White House. Late in May, 1931, the President informed the country that he and his Cabinet had found "many factors they considered favorable." A week later Fred C. Croxton, vice-chairman of the Woods committee, felt it necessary to issue a warning that there must be no let-up in relief activities and that almost certainly millions of unemployed would need assistance next winter.

For a hundred years the federal government has granted financial aid to communities temporarily unable to cope with relief problems created by disaster. In spite of his inaugural declaration in favor of cooperation with "movements of self-help," the President devoted much of his energy during the past winter to the defeat of proposals to cooperate with local communities by supplementing out of federal revenues their relief funds, which were rapidly being exhausted. To defend his position, the President drew an arbitrary distinction between "natural" disasters and economic disasters, although the suffering created by the present economic disruption probably far exceeds the burdens imposed by all the "natural" disasters of the last century. He insisted that relief for the unemployed must be locally and privately financed, although official figures finally disclosed that during 1930, 72 per cent of the meager assistance given the unemployed was contributed by local governments and was therefore out of local taxes. The net result of this policy was to throw the burden upon direct, local taxpayers and to relieve the big income-taxpayers of their fair share of the relief levy.

Expansion of public works to afford temporary employment in times of depression had been favorably discussed for more than ten years. Appropriations large enough to initiate an effective emergency program were urged by President Hoover's own advisers. He insisted upon a meager appropriation of \$116,000,000. To satisfy the demand for a larger program of public works, he has sponsored misleading statements which lumped expenditures for the purchase of land with expenditures for actual construction, which failed to distinguish between the volume of work normally undertaken prior to the depression and the amount now under way, which obscured the amount of employment actually afforded, and which combined federal and State outlays.

Senator Wagner's bill setting up a permanent organization to regulate federal public works in accordance with business conditions was enacted only after long delay on the part of Administration leaders, and a director to guide its operations is yet to be appointed. Creation of an organization for effective cooperation between federal and State employment offices was proposed in a bill passed by Congress only to be pocket-vetoed, after the adjournment, on specious grounds. Instead, the President set up a system of federal

employment directors who have already begun to antagonize and disrupt existing State employment offices. Measures to encourage the establishment of employment reserves or to create a national system of employment insurance were ignored by the Administration, and when the Senate nevertheless authorized a special committee to consider this problem during the present adjournment, Senator Wagner, who had sponsored the creation of the committee, was deposed from the chairmanship by Administration influence.

Other long-range measures—to abolish child labor, to revise the Smoot-Hawley tariff in order to stimulate export trade, to increase federal income and inheritance taxes to provide funds for an expansion of the government's construction program and to enable it to relieve suffering, and to bring about intelligent planning of our economic life in order to prevent a repetition of the situation into which we drifted—have met with Presidential indifference or hostility.

The third winter of unemployment is approaching. Responsibility for the failure of the federal government to provide a program for the relief of distress among millions of our people rests squarely upon President Hoover. The bankruptcy of his leadership in the worst economic crisis in our history reveals the tragic failure of rugged individualism and places the major cost of deflation upon those least able to bear it—the unemployed.

Copyright and Common Sense II*

By THORVALD SOLBERG

THE hearings on copyright legislation before the Committees on Patents of the Senate and the House have produced convincing testimony that amendments to the copyright law are necessary. First consideration should be given to the entry of the United States into the International Copyright Union. This must be accomplished by acceptance of the Berne Convention. There are three texts—the original of 1886, and revisions, Berlin, 1908; Rome, 1928. The copyright bills proposed adherence to the Berlin revision. But the Rome Convention provides (Article 27) that it is to replace "the Convention of Berne of September 9, 1886, and the acts by which it has been successively revised." It is declared in Article 28 that ratifications of the Rome Convention shall be deposited not later than July 1, 1931, and that it will go into effect one month after that date. *If before that date* six countries shall have ratified it, it shall then go into effect as between those countries one month after the deposit of the sixth ratification. There has been unexpected delay in ratifying; hence this provision is now of no effect. New countries, according to Article 28, may enter the union by adhesion either to the Convention of 1908 or to the Convention of 1928 *up to August 1, 1931*. After that date they can adhere only to the latter convention. It is obvious, therefore, that the proposal to go before the next Congress must be acceptance of the convention signed at Rome on June 2, 1928.

Legislation is required to bring our copyright laws into

* The first article on this subject, dealing with the period of copyright protection, appeared in our issue of June 24.—EDITOR THE NATION.

full accord with the articles of that convention. Copyright must be extended to works of architecture, choreographic works, and pantomimes. Article 11 *bis* declares that "the authors of literary and artistic works enjoy the exclusive right to authorize the communication of their works to the public by radio diffusion [broadcasting]," and that the legislatures of the several countries of the union are to regulate the conditions for the exercise of that right. There must also be legislation to carry out the provisions of another new article (6 *bis*) which grants to the writer the right to claim the authorship of his work and "to object to every deformation, mutilation, or other modification of it which might be prejudicial to his honor or to his reputation." For our present common-law or equity protection of an author's unpublished manuscript must be substituted automatic, statutory copyright from the date of the creation of the author's work. The convention declares (Article 4) that the enjoyment and the exercise of the rights granted shall not be subject to any formality. Authors who are nationals of countries within the union must therefore be released from obligatory deposit and registration of copies and the insertion of a copyright notice. The copyright bills have retained obligatory deposit by American publishers of any work in book form "for the use of the Library of Congress"; but otherwise deposit, registration, and notice are made permissive.

A further necessity is the abrogation of the obligatory manufacture in the United States of the foreign author's work. This requirement has prevented the entry of the United States into the Copyright Union since the Act of March 3, 1891, went into force, compelling authors to have their books "printed from type set within the limits of the United States" in order to obtain copyright. The obvious purpose of the provision is to insure profit for the reprinter of the foreign book. It is not certain that it has been of much benefit even for that result. Of the books produced in Great Britain it is estimated that 85 per cent have not been reprinted and published in the United States. Their authors have had to forego obtaining copyright here because the cost of the compulsory second printing of the book at the time of its first publication could not be met. If, however, copyright protection is now assured to British authors from the time of the creation of their books, then, in the natural course of business, a considerable percentage of such books may be voluntarily reprinted in the United States. In the copyright bills, while the foreign author's work is exempt, obligatory manufacture in the United States has been extended to everything produced by an American author "in book, pamphlet, map, or sheet form"—practically every article subject to copyright except works of the fine arts.

For every article deposited there is required to be filed an affidavit "setting forth the manner in which compliance has been had" with these requirements. Not only is there imposed the burden of executing and filing many thousands of such useless affidavits, but the irritating necessity for our publishers of books and newspapers to swear in each case that they have used their own presses! The absurdity of this requirement is manifest. It would seem that for many cogent reasons the time has now arrived for the removal from our copyright legislation of these archaic requirements.

The incorporation of this obligatory manufacture brought into our legislation for the first time the restrictions upon the importation of copies of the foreign author's own

edition of his book. The copyright bills contained detailed provisions relating to this matter amounting to 120 lines of print (Sections 28-31). At the hearings by the Committee of the House of Representatives the Department of State criticized these proposals and recommended that Section 30 be struck from the bill on the ground that its provisions "are designed for the protection of American manufacturing industry" and "are without necessary connection with copyright or with a statute governing copyright." Thereupon the House Committee on Patents altered the text of the bill so as to restore to libraries their present importation privileges, but applied new restrictions upon importation by the individual book buyer. Senator Cutting, during the debate on the copyright bill, spoke in disparagement of this provision and intimated that were it not for nearness to the end of the session he would propose an amendment. It is imperatively required.

Other amendments, not required to permit entry into the Copyright Union but nevertheless highly desirable, are, first, provisions for the legal separation of the various rights comprised in copyright so that each may be dealt with separately and singly and the copyright owner may be permitted to sell any part of his general copyright—such as the right of dramatization or of translation or of use for a motion picture—instead of being subject to the present highly inconvenient necessity of parting with his whole copyright in order to transfer some special part thereof; second, the abrogation of the fixed royalty for the use of copyright music for mechanical reproduction, which, the chairman of the House Committee on Patents declared, would remove "abuses and evils and injustices which have prevailed for nineteen years."

Finally, as concerns the period of copyright, which I discussed at length in *The Nation* of June 24, much could be said in favor of the union term. The fact that some forty countries have adopted it speaks in its favor. It seems probable that it will become the term most widely accepted. Ultimately even the United States may adopt it. But in view of the existing opposition to that proposal, it may be feasible to adopt some reasonable compromise. It is possible to substitute for our present detrimental double term a single term of copyright, to vest in the author from the creation of his work and to continue until the termination of fifty-six years from the date of the first publication or first public performance of the work.

So far as existing copyrights are concerned, they would be taken care of by simply leaving Section 24 of the Act of 1909 in force, which permits an increase of protection for another twenty-eight years beyond the end of the first term of copyright if application for such extension is made to the Copyright Office and registered therein within one year prior to the expiration of such first term of protection.

The great mass of copyrighted works survive publication for only a comparatively short period. But there are some works of such character and value that an even longer term of protection than fifty-six years after publication should in justice be accorded to them in behalf of their authors or the families or heirs of such authors. One method for at least partly meeting this reasonable demand would be to authorize the reprinting by anyone of such books after the expiration of the proposed term of fifty-six years upon the payment of a fixed royalty upon the retail price at which the reprint is sold.

All these improvements should be secured by suitable amendments. But it is not at all necessary, in order to do so, to abandon all existing copyright legislation. Denunciation of the Copyright Act of 1909 has been encouraged as propaganda for the enactment of a wholly new codification. But this was doing scant justice to that act, which was prepared with great patience and much industry upon the part of men well known in relation to literary and artistic property and its protection. It is perhaps well to be reminded that among them were Edmund C. Stedman, Bronson Howard, Edward Eggleston, Mark Twain, Thomas Nelson Page, Robert Underwood Johnson, Edward Everett Hale, Henry van Dyke, R. R. Bowker, George Haven Putnam; John Philip Sousa, Victor Herbert; John W. Alexander, Karl Bitter, Frank D. Millet; and, of lawyers, Paul Fuller, Edmund Wetmore, Colonel Stephen Olin, Samuel J. Elder, and Edward S. Rogers. In Congress devoted service was rendered by Senators Kittredge and Smoot, and Representatives Currier and Washburn.

It should be borne in mind, also, that there is value in such court decisions as have been obtained under that act, which have elucidated its provisions and made clear their meaning and application, and that it is not desirable to depart so far from the original text of the existing law as to lose the value of such judicial interpretation. Much has happened affecting authors' rights since the Act of 1909 went into effect, and it is admitted that amendatory legislation is required to meet the changes which have taken place. But common sense dictates practical proposals for the minimum textual alteration necessary to cure the maximum copyright difficulties.

In the Driftway

ALL the excitement in Republican Spain is welcome to the Drifter, who glories in the revolution. But none of the reports have set him at peace regarding certain things that trouble him. He serves notice that he is ready to shout for the monarchy any day the new regime starts to abolish the Spanish donkey. Spain without donkeys would be like Manhattan without Brooklyn. In a true sense the donkey, whatever his shortcomings, has helped to make Spain. A car will take you around more quickly, and over some of the most delightful roads in the world; but who would want to go to Spain knowing that the donkey was no more, and that half the charm of the countryside was no longer to be enjoyed? If the donkey cannot be used profitably in the new order, why not at least do as the former government did and allow selected donkeys to live on the earnings of the peasants? The ones the Drifter thinks of would nowise be so greedy. Culture, tradition, art, architecture, literature—the Drifter means no offense, but for himself, the more he sees of human culture anywhere, the more he takes to donkeys.

* * * * *

IF there is another creature possessing the same kindliness, patience, and philosophical humor as the donkey, the Drifter would like to know its name. Even when a Spanish donkey feels it necessary to assert itself, the minute its heels

are lowered to the ground those flashing eyes are turned around to reveal a half-conscious smirk, as if to say, "I'm sorry if I hurt your feelings." Along a road outside of Alcalá the Drifter once saw a buff-colored donkey being tormented by a young goat, the latter gifted with more energy than wisdom. After long ignoring the most obvious threats, until the offensive quarrel-picker's head was within lazy reach, the nonchalant donkey, almost with a world-weary sigh and scarcely interrupting its joyous grazing on the frayed side of a tether rope, poked one sharp little hoof into the goat's nuzzle and sent it bleating with outraged astonishment over the dusty red plateau.

* * * * *

AND what has happened to the midget golf that insinuated itself, like a simpering maiden, into this stern land of bullfights? Halfway between Madrid and the Escorial, that pile of ancient stone thirty miles away where the kings of old lived and died, the Drifter once saw a Tom Thumb golf course. Nobody was there; but is anybody ever there when it comes to Tom Thumb golf? Bullfights were unknown in Spain for many generations, after centuries of familiarity; they were reintroduced a hundred years or so ago by an alien king from France, Joseph, brother of Napoleon, who wished to make himself solid with the masses. This gruesome sport may go into obscurity again, and the Drifter hopes it will. But if it goes, something must take its place. Midget golf, at first thought, seems a trifle tame. But if illuminated so that the Spaniards, after eating their usual ten o'clock dinners, could wander out for a few hours' play before retiring at the sober hour of 3 a.m., even this diversion of dotards might tire them out and ultimately cheat the gory arena; for nothing that the Drifter can think of could be so fatiguing to a lively Spaniard—and don't believe they're lazy people—as Tom Thumb golf. But be it midget golf or what not, the Drifter's pious hope for Spain is twofold: that bull-butcher may go, and the donkey's sweet laugh be long heard in the land.

THE DRIFTER

Correspondence

Applying the Brakes

TO THE EDITOR OF THE NATION:

SIR: In the issue of *The Nation* for June 24, in the article on The Tragedy of Herbert Hoover, is a statement which piqued my interest: "But if the major responsibility of the panic is not his, there are minor responsibilities for which he can be and is justly held responsible. His Treasury Department and the Federal Reserve could have put some brakes on the stock-exchange speculation long before the crash."

I am interested to know just what these two organizations could have done and what method they could have employed.

Washington, D. C., June 29

B. M. JOYCE

[The simplest thing would have been sharp and courageous action in raising the rediscount rates of the Federal Reserve banks. Authority for such increase was sought by various of the Federal Reserve banks and refused by the board in the face of clear warning from the most responsible bankers of the country. To quote a single example: on March 7, 1929, Mr. Paul M. Warburg, in an address commented on all over the

world, declared, "Procrastination in bringing such rates into a proper relation to actualities and hesitation in taking effectual means to reassert the Federal Reserve's leadership place a grave responsibility on those in charge of its administration." That responsibility they share with those members of the President's official family who used their position for the encouragement rather than the discouragement of the wild speculation that led up to the crash.—EDITOR THE NATION.

Stone of Ohio State

TO THE EDITOR OF THE NATION:

SIR: When I was in Columbus, Ohio, I was informed that Mr. Julius Stone had been reappointed to the board of trustees of Ohio State University by Governor White, the Democrat now in office. His secretary writes me that I was misinformed and that Mr. Stone was reappointed in 1930 by former Governor Myers Y. Cooper.

I hasten to make this correction, adding, however, that the situation in Ohio State University requires of Governor White more than the negative credit of not being responsible for the reappointment of Mr. Stone.

A personal letter to me from a reader of *The Nation* showed a misunderstanding of my passing reference to Mr. Stone's German ancestry and the change in the family name from Stein to Stone. Nothing was farther from my thought than to reflect on German ancestry, or the good name Stein, or the right of a family to anglicize it if they want. I did mean to imply that under such circumstances Mr. Stone's ultrasolicitude for British imperialism in India as against Gandhi was peculiarly out of order.

New York, July 2

NORMAN THOMAS

Eighty Years After

TO THE EDITOR OF THE NATION:

SIR: In a letter published in *The Nation* for June 17, Upton Sinclair mentions the fact that Einstein's "2 per cent buttons" distributed by the pacifists in Los Angeles are being taken for agitation for 2 per cent beer. He also mentions "the story of 'the days of the 1905 revolution in St. Petersburg, when the revolutionists shouted for a constitution and the troops thought that 'Constitutza' was the mistress of one of the grand dukes.'" Perhaps Mr. Sinclair would be more sympathetic with the mistaken people of Los Angeles if his attention were called to the fact that the incident that he refers to occurred in 1825, during the interregnum of the grand dukes Constantine and Nicholas, and not in 1905.

Minneapolis, June 17

SHELDON KARLINS

Up in a Balloon

TO THE EDITOR OF THE NATION:

SIR: With reference to the aeronautical achievements of Professor Piccard and Messrs. Lee and Brossy, *The Nation*, in the issue of June 10, indulges in one of its frequent bursts of unreasoned criticism. The sour skepticism of this particular editorial paragraph is such as to antagonize any fair-minded reader. Although *The Nation* renders a valuable service in many ways, its utter impotence in dealing with scientific matters is notorious. Let the writer of that paragraph read any of the elementary books on astrophysics and discover why cosmic

rays are so tremendously interesting. Let him keep in touch with aircraft developments and learn about the practical advantages of the Diesel motor which kept Lee and Brossy aloft over eighty-four and one-half hours.

Philadelphia, June 8

ERNEST R. RECHEL

The Nation's Candidate

TO THE EDITOR OF THE NATION:

SIR: The announcement on page 15 of your issue of July 1 that "*The Nation* will not support any nominee of the Republicans or Democrats" represents a change in policy that will be heartening to readers of the most influential progressive American weekly. It means that never will *The Nation* support a candidate like Al Smith in the hope of defeating a more reactionary Republican. It means that *The Nation* will always support a third party, for you are not anarchistic and will therefore never refuse to vote.

You certainly will not back the Communist or Prohibition parties, so you will doubtless give your valued support to the Socialists until such time as the League for Independent Political Action is able to place its candidates on the ballot.

New York, June 29

WILLIAM FLOYD

No Second Term

TO THE EDITOR OF THE NATION:

SIR: It has for some time been clear that Mr. Hoover's friends were starting a campaign for his reelection in 1932; and you now give notice of an intention to unlimber your heavy artillery to meet them. But there is one thing that ought to be said in every reelection campaign, and tiresomely reiterated till every voter in the country is familiar with it. This is that a man who has gone through the strain of a first term as President is not physically fit for a second term, is not capable of doing as well in his second term as in his first. Bringing it down to brass tacks, no President since Andrew Jackson has gone through a second term with as much public favor as he had in his first term, or has gone through a second term ably enough to deserve as much credit as his first term deserved. The Presidency of the United States has become so big a job that it takes too much out of a man; when he starts his second term he is no longer the man that he was when he started his first, and all experience proves that his second term will be at a lower level than his first.

Ballard Vale, Mass., June 15

STEVEN T. BYINGTON

Amos 'n' Andy 'n' Herbert

TO THE EDITOR OF THE NATION:

SIR: The time is June 15, 1931. The scene is a home, in which my father-in-law (Republican) and I (radical) are playing cribbage. The nine-o'clock whistle blows.

"Well," says my father-in-law, "shall we listen to what Amos 'n' Andy have to tell us?"

"Why not?" I lay down my cards in mild anticipation; but instead of the annunciatory strains we find ourselves listening to a speech.

"What in the world is that?"

"That," says my father-in-law, "sounds very much like Herbert Hoover, if I am not mistaken. Can it be that they are cutting out Amos 'n' Andy?" And so it was.

In their effort to "humanize" the President, couldn't they at least have had the foresight to see how disappointing his substitution must be to all the many adherents of Amos 'n' Andy? This egotism will cost him votes. People doubtless heard him who prior to that experience had always thought him a brainy chap, people who would never have known the contrary but for the fact that their radio habits caused them to listen in on doctrine garbled more than Andy himself could have garbled it. But perhaps Mr. Hoover actually chose this hour to be sure of an audience. If so, it is just another example of fools rushing in where even Will Rogers is content not to tread.

Duluth, Minn., June 16

H. J. GRIFFITH

Price Stabilization

TO THE EDITOR OF THE NATION:

SIR: Brazil tried price stabilization. Here is one result, as reported in a cablegram to the Chicago *Tribune*:

RIO DE JANEIRO, BRAZIL. The National Coffee Council here today destroyed 594,000 pounds of coffee, excess stocks, by throwing it into the ocean seventeen miles from shore. This method has been approved as more satisfactory than burning or dumping it near the shore. The latter method has led to the coffee being rescued by the poor.

Every attempt to set aside natural economic law has resulted in serious trouble. For more than a year and a half now the Federal Farm Board has been attempting to set aside natural economic law. In that period world consumption of American cotton has dropped from 15,076,000 bales in 1928-29 to only 5,200,000 bales for the first half of 1930-31. During the same period the consumption of foreign-grown cotton has relatively increased until now the world consumes more foreign-grown than American-grown cotton, though during 1928-29 it consumed only 10,800,000 bales of foreign as compared with 15,076,000 bales of American cotton.

New Orleans, June 18

WALTER PARKER

Disarm Now

TO THE EDITOR OF THE NATION:

SIR: In *The Nation* for June 3 there was an editorial quoting and agreeing with Arthur Henderson's statement that the success of the world disarmament conference to be held next February is "the most vital need of the world today in the field of international relations." Mr. Henderson has also said that "the governments will do what the peoples want. If the people want disarmament they can have it."

In my experience, most people approve of disarmament. The great problem is to arouse them to the crucial situation in regard to world peace. While the militarists, both in the army and in industry, are actively on the job, I find many pacifists who are only discussion-interested, and unwilling really to work.

The Women's International League for Peace and Freedom is circulating in forty countries an international disarmament petition, asking the governments to stand for total and universal disarmament at the conference next February. England has some twenty peace organizations pushing the petition, and a month ago had some 350,000 signers. They expect to get at least a million.

What is the situation in this country? The W. I. L. started its petition campaign last fall. On April 15 not quite 21,000 people had signed in the whole United States. Since that time

there has been a general speeding up of the work, so that possibly the figures are doubled by this time, but at any rate, we are a long, long way behind England. If the disarmament conference is a failure, and the pacifists have not exerted every ounce of their energy to prevent its being so, they are to that extent guilty.

Won't readers of *The Nation* help circulate this petition? It certainly offers a very definite way of expressing public opinion. Canvass your church, your summer school, your clubs, your neighborhood. Petitions may be obtained from any local branch of the W. I. L. or from national headquarters at 1805 H Street, N.W., Washington, D. C.

Dr. Albert Einstein asked for the privilege of signing the petition. President Park of Bryn Mawr, President Comfort of Haverford, and President Aydelotte of Swarthmore are with us. Every historian approached has been glad to sign. Professors Charles A. Beard and Parker T. Moon are two of them.

Philadelphia, June 6

RUTH WANGER

Pioneer Youth

TO THE EDITOR OF THE NATION:

SIR: This month marks the eighth birthday of Pioneer Youth of America, a working-class undertaking which has come to be recognized as one of the most significant expressions of the workers' educational movement. Pioneer Youth conducts an experimental camp in the foothills of the Catskills which a group of trade-union representatives and leaders in the progressive educational movement established for workers' children. Beginning with raw land, the children and staff created most of the facilities needed for community living. They have cut through artificialities and conventional procedure, and are conducting a camp without points and prizes, without uniformity, without competition and regimentation, and have obtained amazing results.

Parents interested in a non-profit-making social camp community for their children, and individuals wishing to make its facilities available for workers' children requiring scholarships are invited to communicate with Pioneer Youth of America, 45 Astor Place, New York City.

New York, June 20

E. C. LINDEMAN

Political Prisoners' Relief

TO THE EDITOR OF THE NATION:

SIR: Some eighty political prisoners are now in jail under sedition and criminal-syndicalism laws or because of strike or union activity. Their terms range from one year to life. The Prisoners' Relief Fund, with Robert W. Dunn as chairman, has been organized in order to send regularly each month to each of these prisoners \$5 with which he can buy postage stamps, stationery, candy, fruit, books. And more important still, the fund undertakes to send each month to the dependents of each prisoner \$20 to help meet rent and grocer's bills.

If every reader of *The Nation* who is not—for the moment at least—in prison for his political or economic beliefs or activities will send a check for from \$1 to \$20, no prisoner need go without his monthly payment and no prisoner's family need go hungry. Every cent that is contributed goes for this purpose, all overhead being covered by the International Labor Defense. Checks may be made payable to the Prisoners' Relief Fund, 80 East Eleventh Street, New York City.

New York, June 17

GRACE HUTCHINS

Meekness After Wrath

By MARK VAN DOREN

Of all perfected things,
Man-made or devil-god-made; yea, or both;
Nothing so undefective is, and fine,
As thundered wrath.

Nothing! save this mute
That follows like a lamb beside the udder,
Gesturing, when the mind—except it burst—
Cannot grow madder.

Nothing so pure as this—
The after-meekness, lacking any tongue;
Nor anything so powerful, though it lives—
Poor child—not long.

Books About Negroes

The Negroes of Africa. By Maurice Delafosse. Translated by T. Fligelman. Washington: The Associated Publishers. \$3.15.

Djuka, the Bush Negroes of Dutch Guiana. By Morton C. Kahn. The Viking Press. \$3.50.

Jungle Ways. By William B. Seabrook. Harcourt, Brace and Company. \$3.50.

THE appearance within a short time of these three books marks perhaps the highest point thus far in the flood of books about Negroes. The difference in the character of the three books, moreover, is not without significance, for it indicates how broad is the interest in this subject. The first volume is a translation from the French of a history and ethnology of the African peoples; the second, a serious account of travel among African tribes in South America; while the third is a good yarn about the "wild" inhabitants of the Ivory Coast and certain regions in the French territory of the Upper Volta.

It is good to have M. Delafosse's conclusions, based on his many years' work with and among Africans, available to the English-speaking public, and in a translation that has been done with as much care as Miss Fligelman has done her work. One is grateful to her for her attention to the transcription of the French spelling of African words, a spelling which, while phonetically correct for French, constitutes a trial to eyes accustomed to English. The difference between Ouagadougou and Wagadugu makes the point, and in choosing the latter, Miss Fligelman has chosen well. The volume would be more correctly named if it were called "The Negroes of West Africa," and it is a pity that the publishers did not see fit to go to the expense of having the maps, lifted bodily from the French edition, redrawn, with the names of tribes and cities and districts set down according to the orthography of the book. M. Delafosse's history, unfortunately, is political history, and thus makes dry reading. Though it is of value to have the story of the rise and fall of the various West African kingdoms in such handy form, I doubt whether many lay readers will have the patience to go through this portion of the book. The ethnological part is much more lively, and constitutes a fine summary of what we know of the customs of the West

African peoples. However, with Professor Labouret, who contributes an excellent preface, one wonders at some of M. Delafosse's conclusions. To give one example: after some intensive work with a Dahomean native on the clans of Dahomey and what animals the members of the respective groups may not eat, and the reasons why they must "respect" their animal relations, it is rather a surprise to come across the statement that there is no totemism in West Africa. However, disagreements over points such as this are the affair of specialists, and need not deter one from commending the work as well worth reading.

Dr. Kahn's account concerns the Bush Negroes of Dutch Guiana. It is a travel book which gives a picture of the life of these Negroes while telling of the author's adventures among them. Having accompanied Dr. Kahn on one of his trips to these people, I can quite agree with Blair Niles's statement, in her preface to the book, that one of the outstanding characteristics of Dr. Kahn's account is its integrity. Unlike so many of the volumes of the past few years, wherein the cultures of various groups of Negroes have been sensationalized beyond recognition of what actually exists, Dr. Kahn reproduces soberly and faithfully what he saw. If one does not agree with some of his interpretations of the customs of the people he visited, or with some of his African correspondences, one is nevertheless quite sure that what is given is an honest conclusion based on what he actually observed. Dr. Kahn does not hesitate to say "I am told" when he writes of something reported to him, and this is something that most authors of popular books about Negroes might well learn from his example. His book is finely printed and beautifully illustrated, many of the photographs and line-cuts being of specimens of Bush Negro wood-carving which Dr. Kahn himself collected in the Guiana bush. Knowing his material, I regret that he did not confine himself to the photographs he himself took, for several of those which he credits as having been taken in the colony have already been published and are thus available elsewhere. One such photograph is unfortunately mislabeled, for the picture given of Jankoeso, chief of the Saramacca tribe, is not of this chief. In one of the appendices to the book there are reproduced some very important examples of a syllabic writing that is used by the Auka tribe of Bush Negroes. This is very little known, if at all, and in publishing the sample he gives us, Dr. Kahn has put students distinctly under obligation to him.

Mr. Seabrook's book exhibits, as far as facts are concerned, his well-recognized tendency either to distort them beyond recognition or to call by the term fact something that is, at best, an account given him by some old-timer. With it all, his style is excellent, and if his accounts were presented as hearsay, or as his impressions of what he saw on his travels, there would be no objection to the books he writes. As it is, however, it is impossible to take his material at face value even for the purpose of criticizing it. I marvel at his findings. For one thing, after some years' experience in the investigation of Negro cultures, I wonder where Mr. Seabrook finds his native friends—men and women who control the most esoteric material of their civilization—who are ready to tell him everything they know. What is the case, of course, is that they simply do not exist outside Mr. Seabrook's mind, and if I were to stop to point out the errors in the account of some of the simplest facts of the cultures of which Mr. Seabrook writes, or to name the sources from which he derives a great deal of his information (reading M. Delafosse's book will indicate something of what I mean), I should require much more space than this deserves. Nevertheless, as I have already said, one must admire Mr. Seabrook's facility of language and the way he knows his public. Adventure? Read how he crossed the

mysterious bridge into Liberia, and what he found there. Sex? Turn to the account of the phallic cult among the Habbé, or, better still, read the tale of Wamba, the beautiful *fétichiste*, and how she shared Mr. Seabrook's mat with him. (Here in West Africa may I be pardoned for wondering what the author did with his mosquito net?) Shivers? Learn how to cook an excellent steak from the thigh of your neighbor. Do you enjoy the feeling of being an intellectual? Read the sprinkling of Einstein, Paul Morand, and Brancusi, and the philosophizing as to whether magic is or is not. Where Mr. Seabrook got his ideas of these matters one cannot say, but they are as far from the African type of reasoning as can be imagined, and one thing is certain—that no African gave them to him.

I have said enough, however, about this book. When one compares it to the other two, one realizes what a pity it is that works of its sort must appear, and still more what a pity that they constitute so often the best sellers. For if the truth be known, the facts about African life are so much more fascinating, even sensational, in their reality than Mr. Seabrook's account of them that they quite shame the feeble glimmer of their verity that is found in this book.

MELVILLE J. HERSKOVITS

Whitman and His Friends

Whitman and Burroughs, Comrades. By Clara Barrus. Houghton Mifflin Company. \$5.

WHEN young John Burroughs met middle-aged Whitman all his senses were alert to the importance of discovering a leader. What he found was a man who confused his contemporaries and whose inconsistencies have always been a source of annoyance to his biographers. The warm handclasp, the dignity of physical appearance, the lack of social poise, the sensual, drooping eyelid, the loosely phrased generalities that rolled from oratorical lips, the personality that repelled and attracted both men and women were all something of a mystery to those who met him. Though Burroughs's acknowledgment of Whitman as a master was immediate and continued throughout the course of his own career, the personality of John Burroughs remained intact. He could take his Whitman or leave him. He understood Whitman's large gesture of friendliness toward all humanity and his deep, impersonal warmth that was extended into an ideal of Emersonian democracy. Burroughs had much of the same impersonalized attitude toward his friends; it enabled him to see Whitman clearly and steadily, to make much of his value to American literature, and to discount the casual flaws in his character.

The Whitman circle in Washington and later in Camden was an extraordinary company. There was William O'Connor, brilliant, vivid, erratic. He quarreled with Whitman over the question of Negro slavery, but was the first to come to his defense when Whitman lost his job as clerk in the Department of the Interior. There were a handful of semi-illiterate and completely lost post-Civil War young men who clung to Whitman as to a mother's apron-strings. There was Anne Gilchrist, an admirable little woman who made a transatlantic pilgrimage to sit at Whitman's feet in Camden. And last of all, Horace Traubel and Edward Carpenter. All these drew their sustenance from Whitman's radiating glory. They constituted what may be called Whitman's family. Burroughs alone was able to negotiate an honest exchange of friendship with Whitman, to influence Whitman's wide range of observation, and to absorb Whitman's influence, recreating it, as it were, into his own idiom. The rest of the company, like most disciples, were a rather pathetic lot. Despite their daily contact with Whitman, none of them seemed to know him intimately. Like a mon-

strous white whale he eluded them. Love for him settled in their brains with something of the density of a thick warm fog. At times they could discern a shoulder, a hand, or the vague outline of the bearded head, masculine in contour and yet curiously womanish, motherly in the same sense that we think of earth as being so. The fog enters Traubel's monumental effort to emulate Boswell; one plows through it patiently so as to catch, wherever possible, the oracular roar of Whitman's voice, but always there is considerably more fog than Whitman. Burroughs, living some distance away on the Hudson with brief visits to New York City and journeys across seas to England, is the better guide. His eyes are wide to all natural phenomena, including man. Whitman as a particular man is worthy of strict observation.

Dr. Barrus has given us the complete story of the Whitman-Burroughs relationship. It is evident that she has an honest admiration for both men, but she is not tricked into attitudes of awe concerning them, nor is she hampered by the necessity of proving a preconceived theory. She handles a large body of source material, arranging it by selection so as to form a coherent narrative. In this fashion the entire story of Whitman's dismissal from the Department of the Interior is accurately reproduced, including a large share of O'Connor's valiant defense of Whitman against a would-be reign of terror perpetrated by Anthony Comstock. There are generous extracts from the Whitman-Burroughs correspondence, from which both men emerge in sharply defined detail, and for those who are interested in the question of Whitman's illegitimate children, there is a plausible answer. Dr. Barrus is inclined to believe there were none, though Whitman on his deathbed spoke of having two—a son and a daughter—both dead. Dr. Barrus's work is an excellent example of sturdy, unbiased scholarship, annotated at intervals by the most reliable of contemporary authorities on Whitman, Mr. Clifton J. Furness.

HORACE GREGORY

Violence on a Business Basis

Dynamite: The Story of Class Violence in America. By Louis Adamic. The Viking Press. \$3.50.

IN the United States a vociferous chorus has been proclaiming that violence is giving way to peace and harmony in all walks of life. Louis Adamic's book, "Dynamite," should serve as a reminder to those who have short memories that harmony between capital and labor is not only not on the increase in the United States, but that no other country can hold a candle to this in the extent and degree of violence that has occurred in connection with labor activities. Violence did not abate even during the reign of the American Federation of Labor, notwithstanding its insistence on harmony between capital and labor, and its emphasis on collective bargaining and the sanctity of trade agreements. The Ludlow massacre, the violence of the "Cossacks" during the steel strike, and many other similar cases were experienced even by unions that were members of the American Federation of Labor. They are instances of the rejection by the powerful capitalists of the olive branch tendered by the conservative unions. On the other side of the ledger there are the cases in which labor in its desperation took the offensive and meted out punishment, or waged open warfare on capital; the McNamara attempt to unionize the structural-iron workers is the most glaring example.

Since the war the character of the labor struggles has undergone a change. Whereas previously it had been carried on, so to speak, in an unbusinesslike manner and as an amateurish auxiliary activity, it has now, in line with capitalistic development, become a "corporate" business enterprise. Labor and

capital have both accepted the change. Now they usually turn to professional mercenaries directed by the racketeers. To such a pass have events come in the outstanding capitalistic country that even the radicals find it necessary to hire help from the standing armies of the racketeers. As in pre-war days the newspapers depicted the colorful struggles between the buccaneers of industry, commerce, and finance, they now entertain their readers by lurid accounts of the battles between rival racketeering gangs.

And what has the future in store for us? Adamic rightly predicts that in view of the new rationalization of violence, the generally unsettled conditions, and the general economic readjustment downward due to unemployment and wage reduction, violence in labor matters is inevitable. Since this book has been written we have had confirmation of this prediction, notably in the experience of the full-fashioned hosiery workers and the coal miners in Pennsylvania. Indeed, in both cases it was American Federation of Labor unions that experienced the attacks of employers and the public authorities. In fact, the history of violence in the labor movement reveals that both employers and public authorities administer violence indiscriminately toward conservatives and radicals. Similarly, all shades in the labor movement resort to violence from time to time. And so the class war goes on whether we like it or not.

Not only has Adamic presented an admirable picture of class violence in its various ramifications, but he has given us a worthy sequel to the brilliant pre-war book on "Violence" by Robert Hunter. The two supplement each other, in that Hunter's book concerns itself primarily with the history of the philosophies and theories of violence, whereas Adamic's book is confined chiefly to a lucid history of the actual practices and events in the United States. Students of labor and social problems should be as indebted to Adamic as they are to Hunter for his valuable contribution to American social literature.

DAVID J. SAPOSS

Letters of a Man and an Artist

Letters of John Marin. Edited with an Introduction by Herbert J. Seligmann. New York: Privately printed for An American Place.

ABOUT seventy-five letters, from 1910 to 1930, by the water colorist to his artist-patron and friend Alfred Stieglitz, along with certain notes written for art publications, make up this unusual volume. Unusual in the first place in that the principals are alive: one might expect a certain embarrassment—or elision—on that account. But though a name or two are blanked, there is little cause for worry here. Because the writer possesses those qualities which give truth without offense: forthrightness, casualness, humor. In a word, genuineness. And this in turn suggests what else is unusual in the volume. So a privilege ordinarily deferred—viewing a man through his letters—is offered while all is still going on.

Occasionally a paragraph in these letters has a sheer literary value. I want to quote one:

They have trees here, too, wonderful evergreens, the more beautiful in their last death throes when the wonderful parasite moss begins creeping upwards and along the branches. Here and there a green piece holding out and then, lo, they are in their death clothes, beautiful, wonderful death wraps.

The expression there is really literary. But for the most part that is not their success, their interest; as with most letters, the interest is in the man and the artist, the man back of the artist. And here there is distinction enough. Personal even to grammar and punctuation, there is a native gnarliness, a

pawky honesty, about these letters which makes them delightful reading, and deserving of their present state.

With regard to the artist: one will get no elucidation of a formula here, no revelation of method or trick. But for the sensitive reader the volume is full of light. There is the paragraph on "fewer strokes—still fewer strokes. . . . A full mellow ring to each stroke." Consider that when you look next at a Marin. There is the paragraph on the artist's medium, whatever it is, as an instrument to give out "the *sing* of his life." How many workers in the arts—even poets, even musicians—try to accomplish their ends by analysis alone, by criticism, by doctrine, by smartness—never coming to the sheer "sing" of themselves, which is simplicity of heart! There is the paragraph on respecting the several identities of the things in front of one as well as the unity of one's picture. That's something, too. All through the letters there is the sense of a continual struggle to "get at" the thing, to be true to both outer and inner vision, not relapsing into a mere transcription of either.

Above all, as one reads, one feels the substance, the feeling back of the vision, which must be the man himself. His feeling for place and life—in this case for that type of elemental scene with which we connect Marin: "Sky, Sea, Mountain, Plain"; the "big forms" almost if not quite dominating the human life there, making it knotty, a little contrary, yet full of character. "But to express these, you have to love these, to be a part of these in sympathy"—I quote Marin. "One doesn't get very far without this love."

FERNER NUHN

White Majesty

The White King of La Gonave. By Faustin Wirkus and Taney Dudley. Doubleday, Doran and Company. \$3.50.

THE worst thing about this book is the ballyhoo that preceded its appearance, which likewise finds expression on the jacket. I was prepared to set it down as another of the numerous pieces of literary propaganda designed to nourish American prejudices and delusions. But between the covers the book is—amazing! Here is a Nordic, white American—though not a Protestant, Nordic, white American (maybe that explains all)—and a Marine sergeant to boot, who actually likes the black Haitians. Really likes them—not Dixie style—and despite the fact that he occasionally—at first—shows the effects of his Occupational environment, treated them like human beings. And so he won their friendship and respect, and even more, their affection. What a lot his superior officers of the Occupation might have learned from him!

As a straight adventure story of a unique experience, the tale stands up well. A tropical island, especially one as virgin as La Gonave, makes an ideal setting. But as a document in an obscure and complex chapter of history, imperialism, inter-racial and intercultural relations, the book contains much of greater value. There is, for instance, this casual glimpse of our *mission civilisatrice* in action:

Wandering down the trail . . . I came to a pole some eight feet high on which straw hats were spiked through their crowns up to at least six feet from the ground. I was curious. I went back to camp and asked what the idea was spoiling such a perfectly useful lot of native hats.

"Oh, that's Williston's attendance record," Blake told me. "It's everybody for himself up here, you know. Each man takes his orders his own way." . . .

"Williston believes that orders to 'get' a Caco (or a bandit) means literally what the old story about the centipede and the tarantula does. 'You had best get him before he first gets you.'" . . .

"He never bothers to bring in the bodies of the men he 'gets.' . . . He just brings in the hats and he files them

on that pole down there to let the rest know what to expect. It's going to get him into trouble, some time, because he's apt to 'get' somebody he shouldn't."

Then there is the Occupation's interpretation of that useful titilliant of prejudice back home—*voodoo*. "Officially we were informed," writes Sergeant Wirkus, "that the voodoo cult was the medium of black magic, blasphemy, treason to Haiti and the United States, communism, and all the other evils that government today is believed to be heir to"; and "we had orders from headquarters . . . to make a report leading to criminal punitive action . . . 'on all voodoo artists.'"

Of course folklore and folk-ways were beyond the high command's comprehension. And there is an interesting analogy between the way the early Spanish conquistadores and accompanying friars treated the native customs—and codices—in Yucatan, Anáhuac, and Peru, a performance roundly denounced in retrospect by our historians, and the manners and methods of our twentieth-century white invaders. Making allowance for differences in time and place, the conquerors' psychosis was much the same. The Americans might have learned a great deal about the native *mores* from such an eminent authority as Dr. Price-Mars (recently elected to the Haitian Senate), but consulting Haitians about themselves wasn't done. (Instead they arrested Dr. Price-Mars for the forced road labor of the *corvée*.)

As for Wirkus—he achieved a great triumph over his environment. Never having the good fortune to meet any cultured Haitians, he reveals—and how revealing it is—his second-hand misinformation that they were all "trouble-making politicians"—the Occupation's prize cliché. Had he met them, probably his touch of nature would have established kinship with them also. They too might have shared in the sentiment that prompted the Gonavian peasants to feel—and one of them to say: "Your white skin has nothing to do with your heart and soul."

But Wirkus—an elite in heart and soul among his fellows who came with ignorance, and hence with contempt and hatred, in their hearts and souls—was helped to his unique success by a fortuitous freedom from supervision. In his own words: "It was a great satisfaction to . . . see . . . how much could be accomplished by leaving a man alone to study the people and make up his mind how they were to be helped to help themselves, rather than driven into doing things according to the rules and regulations of outsiders who had no understanding of them at all."

And being the only one of his kind, he was intuitively recognized as such. His kingship was *pour le mérite*.

ERNEST GRUENING

New Mexico Today

Starry Adventure. By Mary Austin. Houghton Mifflin Company. \$2.50.

NEW MEXICO of the Pueblo Indians, New Mexico of the cowboy regime, New Mexico of the Spanish conquests—all this has been the subject for a number of admirable novels. But no one has written of New Mexico as a land sought for health and happiness, and this is actually the New Mexico of today. How many Eastern families have come West for this purpose and this purpose only and have consequently come to know a new country. It is of one such isolated group in its alien surroundings that Mary Austin chooses to write. She knows her subject from personal experience and she knows New Mexico as very few writers know it.

We meet the Sitwells: Professor Sitwell who must make the long and, in this case, futile struggle against disease in a

country which is imprisonment to him, since it cannot afford him the culture, the libraries, the classrooms which are his rightful domain. His wife is with him, a sensitive woman, more capable of adjustment to her surroundings than is her sick husband. Then there are the two children, Laura and Gard—Gard a mere baby. It is upon Gard chiefly that the country writes its message. Gard alone is capable of building in this land of high blue mountains and loneliness a complete and different education for himself. The years bring about undramatic but important changes in each of these characters. The father of the family dies, but his children remain perfectly in tune with the new environment, choosing it for home.

"Starry Adventure" is perhaps just a bit sentimental in its message, but its message is not very important. The book is a fine piece of realism. Miss Austin knows every detail of the ranch life, knows the country and its changes, knows the Mexicans and the Indians living in it, the strangers coming into it from the East. She has written all this down with reserve and with considerable distinction. She is interested chiefly in the effect of country upon character, and she convinces us of the changes her people live through. She is, moreover, a very good story-teller; the novel has plot and movement and emotion which is not merely sensationalism.

EDA LOU WALTON

Soviet Children and American Adults

New Russia's Primer. The Story of the Five-Year Plan. By M. Ilin. Houghton Mifflin Company. \$1.75.

WHY is it that this book written in Russian by a Soviet engineer for Soviet children aged twelve to fourteen should be printed for American adults and accepted by the Book of the Month Club for at least 40,000 grown-ups in this country? The book deals with the Five-Year Plan which is so much discussed in America's fashionable drawing-rooms, not to speak of women's clubs and the fashion magazines. The hostess must know what it is all about. So must the tired business man. And here it is set forth—briefly and very delightfully.

But serious persons whose mental age exceeds fourteen will also read it with relish and absorbing interest, for it reflects present-day Russian psychology better than the best modern Soviet fiction. An engineer composes a children's book, and nothing is more typical of the new Russia. One sees how the mind of the new Russian generation is being molded; how its thinking is being directed. "We should take nothing on faith," says Engineer Ilin. "Why the Five-Year Plan?" he asks the Soviet youth. "Why these factories?" "We change nature," he replies, "in order that people may live better."

[Man] is not a machine. He has a mind that wants to know, eyes that want to see, ears that want to hear, a voice that wants to sing, feet that want to run and jump and dance, hands that want to row and swim and catch. We must organize life so that not merely the lucky ones but all may be able to feel the joy of living.

The last chapter is on New People. The Five-Year Plan aims to make a new man—at least to conceive him.

The Bolsheviks have banished fairies from juvenile literature. But what need is there of creating a world of myths and gnomes when the new society rising under their very eyes is so exciting, romantic, and fascinating? Ilin's book is not of a unique type in Soviet literature for children. My Vitya, aged seven, and Yurka, one year his senior, demand that we buy at least a few new books each week, and soon I find

myself absorbed in "How Rubber Became Galoshes," "How Cotton Became Textiles," "Turksib," "The Postman"—all expensively and exquisitely illustrated. The dreaming, impractical nation of Slavs is being taught to think of machines, of figures, of efficiency, not for the sake of these things themselves, but because under present conditions there is no other way of lifting 160,000,000 Soviet citizens from their miserably low standard of living. Ilin's primer is so thrilling because it affords a glimpse of the reeducation of a race. One could do it justice only by endless quotation. I cannot see how any teacher will dare to miss the book.

I have often stopped on Moscow street corners to watch a group of Pioneers or Young Communists. And something in their demeanor and manner has made me say to myself: "These people will be free. In them Russia is being reborn." I get the same feeling from reading "New Russia's Primer." It grips you, and instead of you yelling, it yells: "This revolution is tremendous, bigger far than the dirt which accompanies it, the people who lead it, the pigmies who write about it, and the men who suffer from it."

LOUIS FISCHER

The Literary Magazine

English Literary Periodicals. By Walter Graham. Thomas Nelson and Sons. \$7.50.

TODAY the literary magazine is so prominent both in the encouragement of emerging talent and in the publication of work of positive merit that its history must be of interest to all students of literature. Mr. Graham is to be commended, therefore, for providing us with the first complete study of this vast field. If, as I read through description after description of the several hundred periodicals, I sometimes longed for a richer treatment of the background and a more constant relating of the elementary facts to the stream of literary tendency, I can still conscientiously report that Mr. Graham's is a book that all future interpreters of the field will find basic and indispensable.

Establishing the source of the literary periodical as the *Term Catalogue* of books of 1668, Mr. Graham indicates the development by way of the Question-and-Answer serial ("Q. When had angels their first existence? A. Who but an angel knows?") into the essay periodical that culminated in the *Tatler* and *Spectator*. (These first few chapters are actually a rewriting of the author's earlier book on the "Beginnings of English Literary Periodicals, 1665-1715," with some slight revision of judgments and a general correction of inaccuracies.) There is an extended treatment of the growth of the miscellanies in the seventeenth century and the progression into the modern "magazine," which was originally only a storehouse of articles that had appeared in other periodicals, somewhat similar to the contemporary *Living Age*. The reviews that began in 1790 are traced back for their origin to the early learned periodicals consisting chiefly of summaries of scholarly books, and then brought forward to the *Criterion*. Chapters on the weekly review, at present the most common form, and on poetry, drama, and comic magazines indicate the general specialization of function that the serial has undergone. Parallel to these categories, Mr. Graham also develops several pertinent elements, such as the disappearance of anonymity in contributors, the increase in importance and critical honesty of the book review, the practice of paying for contributions, and the heightened literary merit of these contributions.

The scholarly apparatus is excellent: each periodical is described as regards dates of publication, names of editors, publishers, and contributors, nature of the articles and their literary quality, and the size and format of the layout; there are also

a good bibliography and index. In several instances the allotment of space seemed to me disproportionate, as when the *Yellow Book* is disposed of in less than a page (whereas many an imitation of the *Tatler* and *Spectator* is given more) or W. E. Henley's *Scots*, later *National Observer*, the most frequently quoted magazine of its time, is slighted in a paragraph. There is an occasional omission (the *Anglo-Saxon Review*, a quarterly edited by Mrs. George Cornwallis-West, 1899-1901; the *Adelphi*, a monthly edited by J. M. Murry, 1924-27) and an unaccountable inclusion of Henley, who died in 1903, among the contributors to the *Athenaeum* of 1920. But such minutiae do not, of course, detract from the qualities of sound scholarship constantly in evidence.

MORRIS U. SCHAPPES

Books in Brief

A Scottish Man of Feeling: Some Account of Henry Mackenzie, Esq., of Edinburgh and of the Golden Age of Burns and Scott. By Harold William Thompson. Oxford University Press. \$5.

Henry Mackenzie's dates (1745-1831) are almost coincidental with those of Goethe. Both were "men of feeling." Both were poets, novelists, dramatists, critics during a Golden Age of their respective literatures. Both became grand old men of letters. There the analogy ceases. Goethe was the genius of his age and culture. Mackenzie's fame has been overshadowed by his own proteges, younger men whom he so generously fathered into literature, preeminently Robert Burns and Sir Walter Scott. But Mr. Thompson does well to choose the "Scottish Addison" as the central figure in his scholarly history of the period which produced so many great Scotsmen in so many and varied walks of life. This is a thorough, well-written, and provocative study of an age, of a people, of a literature, and of a culture, by an American scholar who three years ago discovered and caused to be published Mackenzie's "Anecdotes and Egotisms," a most important book of reminiscences. Both for the scholar and for the general reader who loves the literature of Scotland's Golden Age, Mr. Thompson has produced a valuable work.

Adventures in the Santa Fé Trade: 1844-1847. By James Josiah Webb. Edited by Ralph P. Bieber. Glendale, California: The Arthur H. Clark Company. \$6.

This, the first of twelve volumes to be edited by Mr. Bieber as The Southwest Historical Series, is the autobiography of a trader who knew the Santa Fé Trail a decade later than Josiah Gregg, whose "Commerce of the Prairies" is the standard account of life along the Trail. Webb adds much to our knowledge of the period and place he lived in; it is to be hoped that the series as planned can be brought to its conclusion.

The Web of Youth. By W. E. Suskind. Translated by Malcolm Campbell. Brewer and Warren. \$3.

W. E. Suskind is introduced by Thomas Mann as one of the most gifted and representative members of the generation of young German writers. His novel, "The Web of Youth," is concerned with that generation of boys who were still in school during the war and very young men during the post-war inflation and consequent deflation. Fleming, the leading character, is the average lower-middle-class boy. His grandfather has seen the gathering and his father the breaking of the war clouds. He himself and his young friends are at first strangely detached from the reality of the war: their school activities, their early adventures are, as always with youth, more important to them than the affairs of their country. Some

of them are sickly from undernourishment, some of them actively radical but without much sense of direction, all of them have indirectly but not very consciously felt the disillusionment of the war period. Their outer and inner lives are analyzed with great sensitiveness by the novelist, whose method is that of understatement and realism. We see all these boys in the "plastic age," changing before our eyes as gradually they are forced into some comprehension of the world in which they live. Their pitiful idealism soon fades, their youth itself is unable to endure the stress put upon it, and they are all grown old early. The book is an excellent, quietly written, and very illuminating study of the present period in Germany and of the influences molding the young men of that country.

Thirty-One Families Under Heaven. By Georg Fink. Translated by Lillie C. Hummel. Horace Liveright. \$2.50.

A German tenement district with its variety of inhabitants and miseries is the rambling subject of a novel not so distinguished as Stephen Crane's "Maggie" or Somerset Maugham's "Liza of Lambeth," but possessing a subjective intensity marred now and then by sentimentality and generally by flatness of style. The most interesting episode lies outside the pale of the tenement in the story of the foolish marriage of the narrator's mother to his blond, brutal father. Only at the very end of the book does one realize that the author had any other intention than to write another account of personal misery; and then this intention seems forced upon him by the necessity of rounding the book off. A more complete realization of his purpose would have forced a more objective approach to his subject matter.

Traitor or Patriot: The Life and Death of Roger Casement. By Denis Gwynn. Jonathan Cape and Harrison Smith. \$3.50.

Casement was knighted in 1911 for his great work in exposing slave-trade horrors in the Congo and in the Putumayo district, a No Man's Land in South America. In 1916 he tried to organize Irish soldiers in German prison camps to return home, with Germany's consent, and take part in a rebellion against British rule. But the prisoners were apathetic, and the Germans suspicious. One small shipload of munitions was sent by Germany, but Casement realized it was not enough and that the rising must fail, and he tried to halt it. Tried for treason, he pleaded that he had not adhered to the king's enemies, but to his own people. Masfield, Chesterton, Conan Doyle, and many others protested vainly against his execution, but there was never a chance for acquittal. Mr. Gwynn's book illuminates much that was obscure in the Casement story.

Eros Invincible. By Ricarda Huch. Translated from the German with an Introduction by William A. Drake. The Macaulay Company. \$2.

Isolated from its context the love story of Frau Huch's novel is moving and successful. Shortly after his marriage, the almost godlike Ezard Ursleu finds that he is passionately attached to his cousin Galeide and she to him. For a long time they keep their passion secret in loyalty to the many people whose sorrow its disclosure would cause. But it cannot be hidden and it causes misery and death in the close-knit and decadent family of the Ursleus. With the death of Ezard's wife the lovers are ready to take their happiness. But now Galeide meets Gaspard, the brother of Ezard's dead wife, and falls in love with him. She is torn between loyalty to her love for the Apollonian Ezard and the power of the Dionysian Gaspard and she kills herself, partly to escape from the dilemma, partly to admit the completeness of Gaspard's power over her. Unfortunately, this story, which would have fitted D. H. Lawrence's hand so well and which he would

Just Off the Press

THE AMERICAN LABOR YEAR BOOK, 1931

There is no other volume in the world giving such thoroughly up-to-date, accurate, and expert data on the labor movements and industrial conditions at home and 48 other countries.

A Few of the Topics Included:

EXTENT OF UNEMPLOYMENT
DEPTH OF THE DEPRESSION
AMERICAN FARMER'S PLIGHT
WAGE CUTS AND COST OF LIVING
OLD-AGE PENSIONS AT HOME AND ABROAD
PROPOSED PLANS FOR UNEMPLOYMENT INSURANCE
UNEMPLOYMENT INSURANCE SYSTEMS IN ALL COUNTRIES

The 1931 edition contains one of the most complete sections on Trade Unions since the encyclopedic volume of 1926. It has a new chapter on Foreign Legislation. It gives latest statistics on Soviet Russia, Germany, and Great Britain.

THERE is never a dull page in *The New Statesman and Nation*, England's leading weekly review.

If you take a real interest in international affairs—political, social, literary, scientific, artistic or financial—you will find in *The New Statesman and Nation* a weekly inspiration. Its comments and criticism are written with a measure of detached common-sense that makes it refreshingly readable, whilst its contributors are drawn from the most virile and authoritative writers of to-day.

The Publisher invites those not familiar with *The New Statesman and Nation* to send a post-card for a specimen copy of a recent issue.

have told in far fewer pages, must be picked out from its very dull context. The story is told by Galeide's brother and it assumes the character of his semi-pietistic, wholly objectionable mind. The decadent family, so proper a background for the story, is wrapped in a Novalis veil of sentimental mysticism which befogs and dampens the whole book.

The Antigone of Sophocles. Translated by John Jay Chapman. Houghton Mifflin Company. \$10.

This beautiful folio contains a translation of the "Antigone" which, if not quite so beautiful, is nevertheless stately, intelligent, clear, and strong. Mr. Chapman, it would seem, has approached his task with an affectionate reverence, for he calls the "Antigone" "the best-written play in the world," which it probably is, and discloses in his memoranda at the end a special liking for the story and its heroine. His translation is hardly superior to several others which exist; but it is fine enough, and a reader would do well to renew his acquaintance with "Antigone" in this volume.

The English Captain, and Other Stories. By L. A. G. Strong. Alfred A. Knopf. \$2.50.

Mr. Strong is a careful observer of men, animals, and nature, and he records his observations concisely and exactly; his prose, though thoroughly traditional, is vivid and forceful. Unfortunately, his talent for visual perception is not accompanied by any equivalent insight into human psychology. The twenty stories in this volume are sketches with little or no plot; most of them are placed in Scotland, Ireland, or Devon, and deal with dialect-speaking fishermen and farmers or with the discontents of young married couples. The incidents related are lacking in significance; the author is content to set down what he sees, and there is little about his perceptions that is individual. The only exception is the title story: an Irishman recalls his boyhood in the summer before the war, when he witnessed the encounter in a friendly gathering of an English officer and an Irish patriot; the reactions of these potential enemies are shown with great subtlety, and the implication that one was killed in France and the other during Easter Week heightens the significance of the whole episode. Little else in this volume is worthy of the author of "Dewey Rides."

Life as We Have Known It. By Cooperative Working Women. Edited by Margaret Llewelyn Davies. With an Introduction by Virginia Woolf. London: The Hogarth Press. 5s.

Here are some personal sidelights on the growth of a notable English movement. In 1844, at Rochdale, twenty-eight flannel-weavers started a cooperative shop which in blazing the trail toward modern consumers' cooperation was to give a measure of practical fulfilment to the visions of Robert Owen. Today, nearly a hundred years later, the English Cooperative Wholesale Society alone is probably the largest commercial undertaking in England. The Women's Cooperative Guild, with nearly 1,400 branches and 67,000 members, was founded in 1883. Miss Davies, for many years its secretary, has here collected a group of autobiographical sketches written by working women themselves—present and past members of the guild. The sketches vary in length and mood, but there shows in all of them a rugged tenacity of purpose, a refusal to submit, without at least a constructive gesture, to circumstances tragically difficult, and a warm loyalty to the suffering millions who do so submit. These sketches may not be literature. They were not written as literature. But they are the stuff of which literature is made. Miss Davies has shown a nice tact in the arrangement and editing of her material, and the introduction by Virginia Woolf is a happy example of Mrs. Woolf's oblique penetration and persuasive good humor.

Has Gandhi Sold Out?

By RICHARD B. GREGG

COMMUNISTS say that Gandhi has sold out to the British and to Indian capitalists. Many non-Communist friends of India are troubled and fearful for the future. The leading causes of such suspicions and fears are these:

1. Gandhi has agreed to go to a conference in London, though formerly he refused.
2. He has agreed to discuss safeguards, reservations, and federation with Indian states.
3. Gandhi is to be sole delegate of the Indian Congress at London.
4. Gandhi's love of non-violence may make him accept compromises in order to avoid violence.
5. It seems a terrible blunder to have arrested the momentum of the struggle for independence when its results were already so great.

Gandhi's willingness to go to London is explainable by changes in the British attitude since his refusal eighteen months ago. The year's struggle has compelled open admission by the British government of the great power of the Indian Congress, and advanced the idea of complete independence much farther in British as well as in Indian minds. Indian Congress representatives will now be treated with real respect. In contrast to the earlier situation, the conference agenda is now defined—to discuss responsible Indian government. True, the phrases "safeguards, reservations, and federation" were in the agreement, but the safeguards and reservations are to be only those which are "in the interests of India." And Gandhi has repeatedly stated, both before and after the agreement, that the safeguards and reservations proposed at the first Round Table Conference were not in the interest of India but of Britain only. As for federation, the Congress regards the Indian princes as a secondary difficulty. Their chief power comes from Britain, and if British power in India goes, the princes will lose theirs, and federation with the Indian states will cease to be a menace.

While it may seem dangerous to make Gandhi sole delegate of the Congress at the London conference, it is no more risky than the whole civil-disobedience movement, judged by ordinary standards. Gandhi is bound by the instructions of the Congress.

At the Karachi Congress Gandhi discussed fully the terms of the truce and the charges that he had compromised, or at London might compromise, be tricked, or sell out. He told the Congress:

The power of repudiation is absolute if your agents act outside the power that you give them. . . . When they [the Congress delegates to the second London conference] have turned traitors and sold your cause, or when they have become so idiotic, so unintelligent as not to be able to see the many traps that might have been laid for them and thus fall into one of these traps . . . you have absolute right to repudiate all that they have done, and that power is good against the whole world. . . . You must understand that

your delegation cannot be so stupid as to forget the sacrifices and the sufferings the nation has gone through. Rest assured that they will not sell the country. . . . All that I promise faithfully to you on my own behalf and on behalf of any delegation that you might wish to send with me is that we shall not be disloyal to the Congress in any shape or form.

Bearing in mind that the Delhi agreement is only a provisional truce, there are real advantages in the one-delegate plan. It will save much expense of money and energy. Also, as Mr. Gandhi wrote in *Young India* for April 9:

Congress could not afford to keep away from the country its best workers for any length of time. In the end it will not be work at the conference that will bring Swaraj; it can only be work in India that can do it. Not the ability of the delegation will tell at the conference, but the power behind it. It was further thought that the Congress delegation was not designed to enter into or examine details but to discuss and examine principles and their application.

But will not Gandhi's love of non-violence make him compromise, yielding to the argument that violence and disorder will be the alternative to the acceptance of British terms? No. Last spring, before the march to the sea began, he wrote in *Young India* that non-violence must prove its power in the face of the worst violence, and that, indeed, there could be no true non-violent resistance until there was a violent situation in which to act. He also said that he would go ahead even though it should mean civil war. He now has a far larger number of devoted and disciplined followers than when he made those statements, and has proved to all the world the power of his method. Since the Delhi agreement he has told the Indians that they may have to renew their suffering.

Gandhi specifically stated at Karachi: "I have not much confidence in our getting what we want at the Round Table Conference." Even failure in negotiation, however, would not be barren; for his going will end the contention of the Indian Moderates—"If we had only all gone together, England could not have refused our demands." To refuse to go now would be to lose the support of world opinion. But world opinion would support a renewal of the struggle after failure in negotiation. Britain asked for this negotiation. In non-violent resistance the resister must, whenever possible, act and speak as if his opponent were going to do right, thus stimulating the spirit of justice latent in the heart of his opponent, even though the latter be imperialist and capitalist.

Gandhi believes that both economic and political freedom are much more a matter of moral character than of exterior organization, conferences, legislation, or particular persons in office. Indian independence will be achieved as soon as an effective majority of Indians are strong enough to refuse to be flattered by the British, to refuse to buy foreign cloth, to refuse to pay taxes, to stand lathi charges without flinching or counter-violence, to go to jail, to be willing to die non-violently for their cause. Such a state of

mind and will is a living thing and requires time to grow. The period of truce is being used to stimulate this growth. This deeper political truth answers the idea that suspension of civil disobedience was a tactical blunder. The detailed hard work, self-control, and discipline shown by India since the Delhi pact are portentous. The difference between India on this occasion and at the time when Gandhi suspended civil disobedience in 1922 shows the marvelous growth in India's understanding of his method and in her readiness for self-government.

Gandhi's experience in struggling against all forms of exploitation is longer and more varied, intense, and thorough than that of any other Indian leader. His record of accomplishment is unparalleled. Neither British politicians nor capitalists of any nation can offer him any position equal in power, security, prestige, or happiness to what he has won by his own political ability, energy, determination, sacrifice, and devotion. He has not sold out, nor will he. He cannot be frightened or flattered. His understanding of exploitation is too profound to be deceived, and his love of truth and of the poor keeps him steady.

Misery stalks the coal fields as the mining industry collapses. In a half dozen states the miners are in revolt against starvation.

"Coal and Capitalism"

By LOUIS STANLEY

The first of a series of five articles will appear weekly in **THE NEW LEADER** beginning June 27th.

What the Articles Will Contain:

Starvation and Coal Production

Can Private Ownership Succeed?

The Price of Crazy Production

Union versus Non-union Worker

Why the Mess?

THE NEW LEADER

7 East 15th Street

New York City

\$2 per year

\$1 for six months

Sample Copy on Request

Copies of *The New Leader* containing the first instalment of the Coal and Capitalism series will be sent on request.

Contributors to This Issue

ROMAIN ROLLAND, author of "Jean-Christophe," "Colas Breugnot," "Goethe and Beethoven," and many other world-famous works, and winner of the Nobel prize for literature in 1915, has been ever since the beginning of the World War the outstanding literary exponent of pacifism.

A. V. LUNACHARSKY, Russian politician, author, and dramatist, was until 1930 People's Commissar for Public Instruction in the Soviet Government.

JOHN GUNTHER is correspondent in Central Europe and the Balkans for the *Chicago Daily News*.

ROBERT M. LA FOLLETTE is United States Senator from Wisconsin.

THORVALD SOLBERG was formerly Register of Copyrights.

MELVILLE J. HERSKOVITS is now on an anthropological expedition to French West Africa.

HORACE GREGORY has just published a translation of Catullus.

DAVID J. SAPOSS is the author of "Labor Government in Post-War France."

FERNER NUHN contributed an essay, Art and Identity, to the last "American Caravan."

ERNEST GRUENING, formerly managing editor of *The Nation*, is an authority on conditions in Haiti.

EDA LOU WALTON is assistant professor of English at Washington Square College, New York University.

LOUIS FISCHER, Moscow correspondent of *The Nation*, is the author of "Why Recognize Russia?"

MORRIS U. SCHAPPES is an instructor in English at the College of the City of New York.

RICHARD B. GREGG, author of "The Economics of Khaddar" and "The Psychology and Strategy of Gandhi's Non-Violent Resistance," spent nearly four years in India, living most of the time in the Gandhi colony.

Have You Thought of What 15 Years in Jail Mean?

Remember fifteen years do not pass as quickly as reading this advertisement. It means fifteen confined summers, fifteen long winters, fifteen lonely Christmases, fifteen years when one cannot celebrate birthdays or anniversaries with people dear to one. It means half of a man's forceful life taken out and put into a cell.

So when you hear about TOM MOONEY you are not listening to a story of abstract injustice. It is the account of a terrible disaster which overtook one man.

Let us not sacrifice a man by being bored. No man can do much singly, but each can do a bit by spreading the truth. Information is the force which must free an innocent man. If you are not fully informed send for the moving account of this unbelievable and ironic disaster.

"Tom Mooney Betrayed by Labor Leaders"

Revised and Enlarged Edition

The pamphlets are sold at cost: single copies 10 cents. In bulk 5 cents plus expressage, in case you could distribute them to friends or thru friendly organizations.

Send all orders and remittances, to

IT IS DIFFICULT to imagine what purpose Mr. Hoover hoped to serve in announcing that "certain persons are selling short in our commodity markets, particularly in wheat," and in urging that "these gentlemen" should "close up these transactions and desist from their manipulation." The action of the market on the day following his statement, when wheat fell still further, did not indicate that the gentlemen in question were taking the President's patriotic appeal very seriously. But suppose that a large short interest had existed in the commodity markets, and that, on the President's rebuke, it had suddenly grown repentant and covered? What would have been the result? There would probably have been a sharp temporary upward flurry, lasting, perhaps, several days or more. After that the market would have had to take care of itself, and as there would have been no short interest to act as a potential cushion, it would have broken badly on days of heavy liquidation or disquieting news. The truth is that short selling is nearly always a minor and temporary factor in its influence on the larger movements of commodity prices. Every bushel of wheat sold short must eventually be bought back; a large outstanding short interest, therefore, is a factor not of weakness but of strength, for repurchases in general raise prices by as much as former sales depressed them.

THE PRESIDENT'S STATEMENT would have been ill-advised in any case, but it seems extremely unfortunate as applied to the present situation in wheat. As the wheat market is notoriously a world market, one

cannot hope to control it very much by abolishing short sales at Chicago. The presidents of the large American grain exchanges, moreover, unite in declaring that the short interest in the grain markets at present is virtually negligible. They remark that with July wheat in the neighborhood of fifty cents a bushel, the lowest price in the records of the Department of Agriculture (the present Liverpool price of wheat, as Charles T. Stevenson, president of the Minneapolis Chamber of Commerce, points out, is lower than it has been for 250 years), few traders see much profit to be gained from selling short. The main cause of the present low price of wheat, as even schoolboys know by this time, is the tremendous world crop, the result largely of Russia's return to pre-war production. On the same day as President Hoover's statement, the United States Department of Agriculture, which so far as is known is not subsidized by short sellers, forecast an American spring and winter wheat production more than 5,000,000 bushels in excess even of that of 1930. The second most important depressing factor in the market is the 200,000,000 or more bushels of wheat still held by the Administration's own Farm Board, which everyone knows must soon or late be sold back to the market. Mr. Hoover could hardly have hoped that his statement would deflect attention from this. This wheat was bought at more than twice the present level of prices. Suppose the Farm Board, instead of being virtuous purchasers of wheat above a dollar, had wickedly sold it short then? Instead of now having 200,000,000 bushels to sell, it would have had 200,000,000 bushels to buy back—which would have been an enormous force for encouragement. Incidentally the board would have made a large profit instead of a heavy loss for the taxpayers. The President's statement, if anything, might tend to undermine confidence rather than restore it; the outlook for wheat prices would be indeed dark if there were no better reason than "patriotism" for refraining from short sales now.

THERE STILL EXIST business men who insist that their particular line must be made the one exception to the world-wide economic adjustment. Here is William L. Enequist, president of the Long Island Real Estate Board, for example, voicing what must be a very widespread opinion among brokers and real-estate owners that rents and real-estate values must not be permitted to suffer any real decline. "It may be true that rents are still greater than many can afford to pay," says Mr. Enequist, "but this does not alter the fact that the landlord is entitled to a return on his investment." Stated the other way round, this proposition sounds considerably more plausible: "It may be true that the landlord is entitled to a return on his investment, but this does not alter the fact that rents are still greater than many can afford to pay." The farmer whose crops are selling at less than half their former prices can hardly be expected, if he is a tenant, to continue to pay as high a rent as he previously did, nor, if he is an owner, can he expect to sell his farm for as much; the manufacturer with a smaller volume of sales and lower prices for his goods is in the same position; not to speak, when we turn to residential rents, of the

PUBLIC LIB

millions of unemployed and the still greater number of those with reduced salaries or wages. Is the landlord "entitled" to "a return on his investment" in any other sense than the security-holder to dividends, the farmer and manufacturer to profitable prices for what they produce, the wage-earner to a job and fair pay? In the long run it will not profit landlords to precipitate bankruptcies by excessive rents, or to maintain nominally high rents with half-empty apartment houses and business buildings. In the present profound readjustment there are likely to be few exemptions.

THE TARIFF COMMISSION, through the President, has reported on the first nine months of its activities since its reorganization. During that time 229 investigations were authorized and 110 of them completed. Of the remaining 119, public hearings have been held on 33 articles, and the status of 51 others is such that public hearings may come at any time. The commission reports that the results of 22 of its investigations, covering 46 articles, were reported to the President. As a result he has put into effect decreases in the rates on such articles as pigskin leather, wood flour, maple sugar and maple syrup, wool-felt hats, sewed straw hats, edible gelatine, olive oil in packages, bent-wood furniture, and pipe organs (for use in cases where admissions are not charged to hear the aforesaid pipe organs). Increases were announced on woven-wire fencing and netting, Four-drainer wire, cylinder wire, woven-wire cloth, hemp cordage, dried-egg products, and last, but perhaps not least, on that very important article of consumption, bicycle bells. The commission is proud that it has disposed of an average of one case per week from the time of its appointment. Well, it is justified if one compares that with the record of the previous Tariff Commission. But when one reads the list of articles cited one cannot pretend that any of them, with the exception of hats, is of particular importance to the American people, while the sad fact remains that there were no less than 21,000 items in the Hawley-Smoot tariff. At this rate it will take Mr. Hoover's flexible Tariff Commission about seventy years to overhaul the whole of the most iniquitous tariff in American history.

THE TIME HAS PASSED when what happens in the courts and prisons of one country is unnoticed beyond its boundaries. The recent revelations of the ill-treatment of prisoners in the Polish jail at Brest-Litovsk echoed all over Europe, and the persecutions of minority politicians in Yugoslavia and Hungary have attracted widespread attention from time to time, as have the bloody crimes committed by the Soviet Government against its own people. But it is our own courts which are now being particularly watched abroad and in a really remarkable way. Thus, in Russia, Cuba, South America, and Europe there have been vigorous protests against the execution of the eight Negro boys convicted in Scottsboro, Alabama, on the charge that they assaulted two young white women of admittedly loose character. In Dresden, Leipzig, and Berlin groups of Communists have demonstrated before the American consulates, even smashing six windows of the offices in Berlin. It is, unhappily, obvious that, with the Southern temperament what it is, foreign protests will not help but injure the cause of the convicted Negroes. But it is not only this case which stirs sentiment abroad. No less a person than Albert

Einstein has just appealed directly to Governor Rolph of California asking for absolute pardon for both Mooney and Billings. The world has not forgotten the crime of the execution of Sacco and Vanzetti. It looks with suspicion upon American justice and finds much in contemporary American newspapers to sustain its mistrust.

THE GREATEST political demonstration in the history of the Philippine Islands"—so the cables reported the outpouring of Filipinos in honor of Senator Harry B. Hawes of Missouri in Manila on July 12. There were 40,000 marchers and 120,000 to 160,000 looking on and applauding, and Senator Hawes received an "elaborately phrased expression of gratitude" for his "untiring and entirely unselfish efforts in behalf of the Philippines." Senator Key Pittman of Nevada, who was also present, received a much less eloquent resolution of gratitude since he has been less outspoken for Philippine independence than Senator Hawes. Some of the marchers—like the school children—were doubtless forced to parade. In spite of that, the Filipinos have again made clear beyond question that they wish to cut loose from us. Indeed, the feeling became so intense that there was a conflict between natives and Americans, with the result that the latter were stoned. Of course our jingoes and imperialists will reiterate that the Filipinos are unfit for self-government. That is not our business; it is not our country but theirs, and their wishes alone should control. After thirty-three years we have failed to win their affection—they want to be rid of us.

HOW TREMENDOUSLY INDIGNANT the newspapers can become over the violation of constitutional rights when it is some of their own people who fall under the blows of policemen's clubs! Most of the press can look on with perfect equanimity while workingmen, college professors, and others suffer from the lawlessness and tyranny of the authorities, but let a single reporter be harmed and the press forthwith begins roaring. At Barberton, Ohio, on June 26, the police with tear bombs and billies charged an open-air meeting of radicals being held contrary to the wishes of the city authorities. The guardians of the law failed to distinguish, however, between radicals and newspapermen. Frank Demshaw, a photographer for the *Akron Beacon-Journal*, was blackjacked during the assault (it is said he will lose his hearing in one ear as a result), while Edwin W. Kain, a reporter for the same paper, "was kicked in the side by an unidentified club-wielder, but not seriously injured." The newspapers of Ohio immediately got into action. Damage suits were filed against nine policemen and special officers of Barberton. The fact that several other citizens were also clubbed seems to have been lost sight of in this great outburst of indignation. But of course they were only Communists.

NO FEWER THAN 115,537 NEGROES were added to the colored population of Manhattan in the decade from 1920 to 1930, during which period the white population decreased by 537,000. Indeed, to traverse Harlem on one of these summer nights is to raise the question whether the flood of colored humanity there visible will not submerge still other quarters of the metropolis. In the Bronx the Negro gain was 8,124. In 1910 Negroes in New York con-

stituted but 2.6 per cent of the population; they are today 12.03 per cent. In New Jersey there was a similar development in this last decade; the white population increased 26.1 per cent, while the Negro rose 78.3, so that there are now 208,832 Negroes in that ex-slave State. In New Jersey, too, the influx settles in the towns and cities and enormously increases the problem of urban government. In the hands of unscrupulous politicians Negroes become, like many other groups, a menace to the health and progress of the community. Given inadequate residential spaces, they are bound to add enormously to the problem of government.

IT IS ALMOST INCREDIBLE that any government could allow its juvenile offenders to be treated with such wanton brutality as that depicted in the latest Wickersham Commission report. The revelations of the treatment accorded minors in federal prisons were published by the White House. They showed that boys have been flogged and girls confined in dark cells for infractions of prison rules. "A few minor offenses noted in the records" of the Chillicothe (Ohio) Industrial Reformatory, says the report, include "possession of a two-cent stamp, talking in mess line, concealing an apple in bunk, kicking a refuse can, stealing five eggs from the kitchen." In some of the jails where children have been kept awaiting trial there were found conditions "of filth and misery impossible to convey." That a situation like this has been permitted to develop is another grave indictment of our penal system. The commission itself declares that "the federal government is not equipped to serve as a guardian to the delinquent child. Nor should it assume this task. Whenever a child has broken a federal law, his local community has failed in its responsibility to furnish adequate parental guidance. This duty is local, not national." It is recommended that the "federal government be empowered to withdraw from the prosecution of juveniles," leaving this task to the States and communities.

THE HEART OF EVERY SPORTSMAN must go out to the skippers and crews of the ten yachts that started from Newport on July 4 in a 3,000-mile race to Plymouth, England. Ranging in length from forty-six to seventy-one feet, the boats are well within the class of ships to which an Atlantic crossing is weighted with peril. It is true, of course, that many boats of no greater length and many of less have crossed the ocean safely. But in the weeks that are required for such a voyage high courage and a stout heart are demanded of those who make the trip. There will be fog and heavy weather, unpredictable winds, the treacherous currents of the North Atlantic; hard work, little sleep, a surfeit of canned food, life under difficulty and hazard will attend the voyagers. If the yachts are captained and in some cases manned by those accustomed to living luxuriously, all such considerations will be thrown overboard. Two-fisted mariners are required for this trip, and it is safe to assume that no others had the temerity or backbone to apply. It is rather a pity that the officials in charge of the race could not permit the midget sloop Ahto, whose twenty-eight feet of length has already safely negotiated the Atlantic, to compete because she was so small. The Ahto sailed nevertheless, politely waiting until the ten contestants had crossed the starting-line. She will come along, too, and will share the good wishes that attend all.

Impatience for Peace

ALL that words can do for peace was done on July 11 at the great demonstration meeting in Albert Hall, London, when 8,000 persons inside the hall and many times that number outside heard Ramsay MacDonald, Stanley Baldwin, and David Lloyd George tell them, in language that there could be no mistaking, what the Government of England meant to do to stop war. The Prime Minister's speech came first. He spoke not only of the united enthusiasm for peace that exists in England but of the folly of preparation for war: "History is one unbroken story of armed peoples attacking armed peoples." Unfortunately, he added, "the sentiment of peace is universal. The practice of peace is circumscribed." The coming Geneva conference on disarmament *must* bring results.

Mr. Lloyd George was equally pertinent. We have talked peace and prepared for war, he said. We have had disarmament conferences, a Locarno agreement, a pact to renounce war—"proposed by a country whose armaments were much more powerful than they were before the war and whose armaments have increased since they signed the pact to renounce war." And since then all the nations which attended those conferences, which signed that agreement and that pact have become more militaristic than ever. "They have kept Germany to her promise but they have broken their own." "The world is going on steadily, horribly, stupidly marching toward war, that catastrophe, singing the songs of peace and preparing for war."

These are not merely words, they are facts. In France, in the United States, in Germany, in Japan, even among England's navophiles it is evident that the lesson of the last war has not been learned. We have thought that an overpowering sentiment against war would have to spring up from the people of every great nation. Governments make war, we have said time and again; peoples must make peace. It may be that, owing in part to the present condition of the world's finances, this state of affairs is changing. Governments may begin to realize what a powerful instrument they are controlling, that the safety of mankind rests on their refusal to unleash these engines of destruction, to arouse the war spirit, to give the jingoes in any country free rein to print their lies and their half-truths in order that an enemy may be created and a war begun. The speeches of these three men indicated something of the kind, as did the remarks of the chairman, Field Marshal Sir William Robertson, fifty years a soldier, when he said: "I believe the majority of the people in the world now think war hurts everybody and helps nobody—except the profiteers—and settles nothing."

No sounder truths about war and peace could have been spoken. What remains? Patience, said Mr. MacDonald, patience and persistence and faith. Impatience, said Maude Royden, the only woman speaker, impatience from the common run of people, so that the negotiators for peace would be compelled to get results. Words for peace are very well. But what we must have in addition is a burning, an unconquerable, an undeviating hatred of war, any war for whatever reason. When war becomes unthinkable, then, and then only, is peace assured.

International Bankruptcy in Sight

ALMOST like lighting out of a clear sky came the fresh developments in the German financial situation which culminated in the failure on July 13 of the great Darmstädter and National Bank. That the situation remained grave after the acceptance of the Hoover moratorium was obvious, but it was everywhere believed that the President's action had removed the possibility of disaster. Yet it was disaster which faced not only Germany but all Europe when the week of July 12 began. Whether international bankruptcy has definitely been avoided is not certain as we go to press, despite the encouraging actions of the Bank for International Settlements and the readiness of the central banks of the various countries—with the exception of France—to extend prompt aid. That was the least they could do, for if Germany collapses financially, the rest of Europe cannot escape the consequences and will be drawn into equal misery. We are well aware, and have frequently stated, that the German Government's conduct of its affairs has often been extremely ill-advised and mistaken, as was repeatedly pointed out by S. Parker Gilbert when Agent General of Reparations. But that is today entirely beside the mark. What the financial powers and governments are today fighting for is the safety of Europe and of capitalist government everywhere.

If it is necessary to place the responsibility anywhere, let us put it where it belongs—upon the madness of Versailles, upon the utter stupidity and folly of the whole reparations and debt policy, which, as *The Nation* stated from the very beginning, was impossible of fulfilment, fraught with most grievous mischief for the whole world, and certain to bring economic misery if not complete disaster in its train. Europe is paying now for the political folly and the economic insanity of the men who made the Treaty of Versailles—Woodrow Wilson, Clemenceau, Orlando, and Lloyd George, and it will never be safe again until the books are wiped clean of all the Versailles mistakes. Even as we write, the measures of safety proposed seem utterly inadequate. In 1894 the United States Treasury, in the emergency of that year, got together \$100,000,000 to protect the gold reserve; it was swept away in a few days. The credit of \$100,000,000 given to Germany following the Hoover moratorium announcement was exhausted in nine days. The additional sums offered by the B. I. S. will similarly help but little. There must be offered not only the necessary funds but much more than is needed, if the situation is to be saved. Meanwhile, Germany must do its utmost, besides closing all banks for two days, besides taking over the Darmstädter Bank, besides restricting credit and limiting the withdrawals of foreign capital. It is the gravest financial emergency which the modern world has ever faced, and it is surpassed in its menace to all nations only by the outbreak of the World War on August 1, 1914.

Whatever else may be confused, one thing is beyond doubt, and that is the despicable character of the policy followed by the French. Approached by Dr. Luther with a plain statement of the exceeding gravity of the German crisis, the French Premier calmly replied that Germany

could have financial aid, but only upon certain terms. Not financial terms. It was not a matter of haggling over interest rates, or other conditions of a loan, or series of loans. No, indeed. What Premier Laval, in the role of Shylock, demanded was political terms. Germany must cease building her "pocket battleships" and abandon her customs union with Austria—the latter already referred to the Hague Court for decision as to whether it violated Germany's treaty obligations. For cold-blooded, sadistic cruelty commend us this French action. If this is justified, it is humane and moral to withhold a life-preserver from a drowning man while one seeks to wrest from him a promise that he will restrict his liberty in return for his life.

Never since the Brest-Litovsk treaty of Germany's making have we witnessed in international relations anything similarly calculating and conscienceless. But even worse than its cruelty is its stupidity. Apparently the French politicians were quite willing to have Germany collapse if only they could get their pound of flesh. Even after the failure of the Darmstädter and National Bank, when in Basel, Berlin, London, and New York last-hour efforts were being made to save Germany in order to save Europe, the word came again from Paris that the German Ambassador, von Hoesch, had been received by Briand and Premier Laval only to be told that while France was "quite sympathetic" it would abate not one jot of its demand, decrease not a tithe the blood-price demanded for its aid. What is that price? Nothing else than that Germany yield its national independence and become a vassal state—to France; that it allow France to dictate to it what its foreign policy shall be; whether it can or cannot make a simple tariff agreement with a neighbor.

It is the folly of it, we repeat, that leaves us aghast. For Europe is at stake. We suppose that some of the French politicians are still of the belief that if Germany collapses, a "menace" to France will have been removed, France might then help herself to the left bank of the Rhine, and go her way supremely content with Germany prostrate, in ruins. Nothing could be farther from the truth. Let its officials ask any American financier what the effect on France's finances of an insolvent Germany will be. Let them ask themselves if with chaos and perhaps anarchy in Europe they can keep the contagion from crossing their borders. Let them inquire of any of the leading British statesmen what they think the effect will be on Great Britain if Germany collapses. But they need not stop to do that. Let them read the outburst of indignation from the British press at their attitude toward Germany, such a warning, for example, as that of the *London Times* that there must be "no more haggling," that "the sands of time are running out," that "the [French] process of hard bargaining that has followed Mr. Hoover's original proposal has largely nullified its beneficial effects already"; and then let them ask themselves whether the price in international anger they are paying for their Neronian policy is worth the cost. *They* be unaffected if Germany collapse? Let them call the tune as they please. Eventually they will pay the piper, and not only they, but all of Europe and the United States as well.

A Triumph for Labor

THE most progressive piece of labor legislation in the country has just been enacted into law by the State of Wisconsin and signed by Governor Philip La Follette. This is Wisconsin's labor code, introduced some months ago by State Senator Thomas Duncan. It is substantially the same bill as that recently introduced in Congress by Senator Henrik Shipstead and now indorsed by many prominent lawyers as well as by labor organizations throughout the country, and it closely approximates the model labor bill drawn up by the Committee on Labor Injunctions formed by the American Civil Liberties Union, under the chairmanship of Charles F. Amidon, former United States judge.

The main features of the bill are three: one dealing with the "yellow-dog" contract, one dealing with procedure in cases of application for injunction, and one defining the rights of persons committed for contempt of court in injunction cases. In addition there is a general statement, a sort of bill of rights to introduce the various aspects of labor legislation. The measure then proceeds to outlaw the yellow-dog contract—whereby an employee engages, as one of the terms of his employment, not to join a specific labor union—declaring it to be "contrary to public policy" and not to afford any basis for legal or equitable relief in court. Next it declares that "whether performed singly or in concert" strikes, membership in a labor union, payment of union dues, giving publicity to strikes, peaceful assembly, peaceful picketing, and in general the orderly conduct of strikes and labor disputes shall be in all ways legal, and that none of the foregoing acts may be enjoined by any court.

Most interesting, however, are the provisions with regard to the granting of injunctions. The bill removes entirely the possibility of the summary granting of ex parte injunctions, and provides that the courts may issue an injunction only after clearly prescribed procedure designed to protect not only the complainant but the defendant. Injunctions may be granted only after a hearing at which witnesses for both sides are heard under oath; affidavits are no longer permissible as evidence of the necessity for an injunction. Ample evidence must be given that unlawful acts have been committed or are threatened and that public officers charged with the duty to protect the property of the complainant are unable to furnish that protection. Due notice of injunction proceedings must be given. Temporary injunctions may be issued—after sufficient proof of their need has been offered—only for a period of five days and only after forty-eight hours have elapsed, during which due notice must be given that the application for injunction has been made. Nor are temporary injunctions renewable, although if hearings have actually begun, the temporary injunction may remain in force while they proceed. And, finally and in some ways most important, bond must be posted by the complainant to cover costs of the proceedings.

The provisions to cover contempt cases are equally far-reaching. Persons charged with civil or criminal contempt for violation of an injunction shall enjoy the right to admission to bail, the right to make adequate defense, to a

jury trial, and to demand that they be heard before a judge other than the one before whom the alleged contempt was committed. Punishment for contempt is specifically defined and limited to a fine not to exceed twenty-five dollars or to imprisonment for ten days or both, and, when the fine is not paid, fifteen days is the limit for incarceration therefor. The latter provisions, of course, do away with the time-honored practice of holding labor "agitators" in jail while the injunction, itself often of long duration, remains in force.

It will be seen from this fairly detailed account of Wisconsin's labor code that the rights of labor and the conduct of the courts with respect to labor organizations are defined to a surprising degree. While Wisconsin is the leader in this defense of labor's rights, others States are slowly coming into line. Pennsylvania passed at the last session of the legislature two bills, one of which changed the procedure in injunction hearings and the other of which duplicated the Wisconsin provisions in contempt cases. Both of the bills were bitterly opposed by former Senator Grundy, and although Governor Pinchot accepted Grundy support at the last election, he was courageous enough to sign the bills regardless. It is said that not a few votes for the bills were for the sole purpose of embarrassing the Governor. If this is so, the legislators in question were hoist with their own petard, for the obnoxious bills have become law. Bills outlawing yellow-dog contracts have been passed in Arizona, Colorado, Ohio, and Oregon. Ten other States introduced similar legislation, but it failed of passage. But now that Wisconsin has led the way, and that even the National Civic Federation, under the headship of Mr. Matthew Woll, has indorsed the federal bill, other States will undoubtedly follow. It is by no means unlikely that, owing largely to the concerted, nation-wide campaign carried on by the injunction committee, we are at the turning-point in labor equity. Nor should the effect of the violent protests in the Judge Parker case be overlooked.

The question of the constitutionality of this legislation will undoubtedly come up as soon as the laws become generally in force, if not in Wisconsin's conservative courts, then surely in the courts of other States. The Supreme Court of Massachusetts, one of the most reactionary courts in the country, has already ruled that anti-labor-injunction legislation similar to Wisconsin's is unconstitutional. With respect to the injunction procedure and to the limitations in contempt cases, the matter must be tried out as it comes up. No strictly analogous cases have been heard before the United States Supreme Court, and the temper of that body is such at present that labor may feel it has at least a fighting chance of seeing its rights in court, as defined in the Wisconsin law, upheld. There is every reason to hope that the new Wisconsin law will remain in force, and that other laws similar in content will be put on the statute books and stay there. Too much credit cannot be given not only to Senator Duncan of Wisconsin, but to Judge Amidon's committee, of which Alexander Fleischer of Philadelphia, volunteering his time, was perhaps the particular star, for achieving what may be called a triumph in labor's cause.

President Hoover's Record

V. The Presidential Appointments^{*}

By CHARLES A. BEARD

PRESIDENT HOOVER'S appointments have been under a heavy fire. Ardent souls who expected miracles on the day of his inauguration have been disappointed. They seem to have thought that Mr. Hoover's previous training, experience, and demonstrations of interest meant a divorce from historic politics and the selection of supermen for the administration of the great departments and agencies under his jurisdiction. At last, it was said, we have a man who has come to the White House by a route of distinguished service, not the ordinary dusty way of politics, and who will be free to choose "the best men in the country" for high offices of state. Of course, no seasoned observer of the political show cherished any expansive delusions, but editors given to literary hopes and liberals always on the lookout for marvels began to search the heavens for rainbows on March 4, 1929. Judging by their recent comments on Presidential manipulations they are discontented. Were they justified in their expectations? Have they warrant for their present depression of spirit?

Before attacking these questions, a number of considerations must be drawn into the picture; points of reference, bench marks must be set up. First of all, what are the criteria by which to judge excellence in political personalities? Are there units of measurement which can be established by the Bureau of Standards, good always and everywhere? Is the fact that a man looms large in the headlines and is praised in double-leaded editorials by sapient Olympians proof that he is "great"? These questions may be answered at once with an emphatic no. There are, to be sure, many soothsayers, necromancers, and shamans who think that they know "greatness" when they see it, but those who are given to the long study of history shrink from snap judgments. Matters of greatness are complicated—men and women do not know their real powers until they confront the impossible; and circumstances, no less than inner urges, account for the permanent stars on the horizon of humanity. If Lincoln had died in 1857, he would have appeared only in the local histories of Illinois as a village politician of dubious and devious methods; had he lived until 1880, through the scandals of the reconstruction era, he might not be today one of the saints in the national calendar.

Headlines and popular judgments are far from infallible. Who was the greatest figure in Europe during the storm of the World War? Joffre, Ludendorff, Foch, Clemenceau, or Lloyd George? Perhaps in the long verdict of history it may not be any of them, but an obscure, despised, outlawed agitator, Nikolai Lenin. It is too early to speak with assurance, but if the Soviet system succeeds and forces world-wide transformations in politics and economy, it may turn out that the mighty men who fought the war will be regarded as the last of the barbarians and Lenin will be

hailed as the harbinger of a new day. If the Soviet scheme fails and the diplomacy of Europe continues on the old level of Petersburg-Berlin-Paris-London cynicism, then Lenin may linger in history merely as a sinister curse or troublesome madman. The strange thing is that concerning our contemporaries we never can tell, or at best can make only a poor guess. What capacities, therefore, may be buried in President Hoover's official family may never be known. They may never emerge from the commonplace cloud that hangs, in an era of peace, over the land of the free and the home of the brave. But some kind of crisis may test them in fire. Destiny always shimmers like a mirage on the horizon. There are times and circumstances. Carlyle to the contrary notwithstanding, great men do not make history; or at all events they cannot make a drama out of gossip. If to reporters hot for news or editors bent on swift judgment, all this seems remote, the retort is that "Weltgeschichte ist Weltgericht" and all other courts are on a level with the justice of the peace.

Zooming a little nearer to earth, let us take a look at the political landscape in which the President of the United States operates. No matter what may be the power of the President's personality, he must work with his party. Free lances may talk savagely about "breaking the shackles of party," but the Chief Magistrate of the nation is put into the White House by a party and he makes promises and creates obligations in the process of getting there. It is childish to ignore these cast-iron realities. Wistful wishers may long to see the day when a President will strike out right and left, declare his indifference to renomination or to the fate of his party after he has climbed the ladder and got over the wall; but the country is not governed by or for wistful wishers. The mighty Roosevelt, even when he was beating coal-mine owners over the head during the great strike, was playing politics to get the grand old party's contingent back into the Congress of the United States. And if a careful study is made of his "hard hitting" it will be seen that he picked dead men for his stunning blows—until the squall of 1912. He could use the big stick on Bryan, but he spoke softly unto T. C. Platt in the latter's day of grace. No President ever did or can, save at great peril, ignore his party fences; nor can the public ever distinguish operations on his part designed in the interest of personal advancement from operations intended to protect party interests. So those who are inclined to attack Mr. Hoover's appointments will do well to consider prayerfully the state of the Republican Party before they let off their heaviest artillery.

Swinging lower, nearer to political earth, we may look still closer at the net in which the President works—the close-watched servitude mocked by the pomp of power, as Macaulay would say. Few indeed are the appointments in which he really has a free hand. Glowering on the eastern sky is the Senate of the United States. The President's

^{*} The fifth of a series of articles on President Hoover's Record. The sixth, Mr. Hoover's "Noble Experiment," by Professor Peter Odegard of Ohio State University, will appear in our next issue.—EDITOR THE NATION.

chief nominations are subject to the review of that august body, and the Republican members of that august body know full well, most of them at least, that unless appointments falling within their respective States are made with reference to local machinery, they will fail to return at the end of their terms. This may be regretted, but it is exigent. Even members of the House of Representatives belonging to the President's party have a hand in the racket, at all events with respect to minor federal appointments "back home." Of this situation William Howard Taft once wrote a bit plaintively:

A member of a community remote from the capital . . . wonders that a President, with high ideals and professions of a desire to keep the government pure and have efficient public servants, can appoint to an important local office a man of mediocre talent and of no particular prominence or standing or character in the community. Of course the President cannot make himself aware of just what standing the official appointed has. He cannot visit the district; he cannot determine by personal examination the fitness of the appointee. He must depend upon the recommendations of others; and in matters of recommendations, as indeed of attaining office, it is leg muscle and lack of modesty which win, rather than fitness and character. . . . He is made dependent [on Senators and Representatives] because the Senate, by the Constitution, shares with him the appointing power; . . . practically, because of the knowledge of the Senators of the locality, the appointing power is in effect in their hands subject only to a veto by the President.

Such is one of the penalties of smoke-screen government, and there is no justice in putting the whole burden of responsibility for selections on the President himself. What goes on behind the scenery that is visible to the public cannot be known.

Coming at last to personalities, odious as the operation is, there are concrete facts to be considered. In a general sense the President's Cabinet officers are his personal representatives. The Senate seldom interferes with his selections for these posts. The accident to Mr. Charles Beecher Warren, whom Mr. Coolidge tried to make Attorney General, is an exception that proves the rule. It is safe to assume that Mr. Stimson is President Hoover's deliberate choice for Secretary of State. Like all other appointments, this has been criticized. Well, Mr. Stimson is certainly as well qualified for that office as Mr. Kellogg, or Mr. Lansing, or Mr. Bryan, or any one of ten or fifteen other dignitaries who have filled the place. That is speaking modestly at least, and without any prejudice in Mr. Stimson's favor. Yes, the pessimistic critic will say, but it is not a question of relative merits; a greater man than Mr. Stimson should have been selected. That sounds good to tender ears. But the writer of this article a few days ago put to an old and experienced student and practitioner this poser: "Who in the Republican Party in this year of grace is better qualified for the office of Secretary of State than the present incumbent?" After long deliberation he suggested Mr. Silas Strawn of Chicago. When for the sake of argument his contention was admitted and additional names were called for, the aforesaid expert in public affairs broke down and wept: there were no others. Anybody who wishes to take a whack at Mr. Stimson may profitably take stock of the supply of experts in foreign affairs now available in the

Republican Party—experts, that is, who have not committed themselves openly to some such heresy as the League of Nations or another fairly positive proposition. This game of hide and seek is as informing as it is diverting. And it may be applied with equally pertinent results to the remaining members of Mr. Hoover's Cabinet. Compare, for illumination, Mr. Wilbur with Mr. Roy O. West or Mr. A. B. Fall. Compare, for further light, Mr. Hoover's entire Cabinet with the array of talent gathered by Mr. Wilson, sometime president of Princeton.

Passing with due obeisance into the presence of the Supreme Court, we encounter Chief Justice Hughes. If there is any meaning at all in the history of the Republican Party from the spacious days of Alexander Hamilton to the crabbed hours of Calvin Coolidge, then Mr. Hughes was the logical, inevitable choice for the place. Against his character and learning not a word could be breathed, and there was as much reason for expecting liberalism from him, if that is desirable at all in that high tribunal, as from any other prominent Republican who could have been elevated to the position.

About the President's attempt to appoint Judge Parker much furor was raised, but there are today and have been in the past men of smaller caliber in the Supreme Court—men of economic views cast in a similar mold. In spite of all cavil there was something to be praised in the idea of having the South represented in the manufacture of federal jurisprudence. When Judge Parker was unhorsed, the President selected Mr. Roberts, who, it seems to be generally conceded among newspapermen, is not only worthy of the place he occupies but is likely to surprise the saints by doing some thinking on his own account. If the President should nominate "the right kind of man" according to the canons handed down from Mark Hanna's day, Dr. Moses's sons of the wild ass would flatten the victim under their iron hoofs; if he should dare, like Roosevelt or Wilson, to select some American lawyer openly, manifestly, and notoriously known to be tainted with sociological jurisprudence, a cry of distress would go up from vested interests which would rock the Republican boat and toss to heaven the sea in which it sails. No wise man bores a hole in the bottom of his own vessel.

Without going into other details bordering perhaps on the invidious, we may look at President Hoover's selections for the Federal Power Commission. No one will contend, it may be presumed, that any of the men chosen for this agency is a transcendent expert in public utilities. No such expert could possibly have been appointed to the commission. If Mr. Hoover had chosen as chairman Mr. Morris L. Cooke or some member of an existing State commission known to be strict in his theories respecting prudent investment, realistic valuation, and fair return on bona fide capital, the nominee could not have got past that third house of the national Congress—the Organized Utility Interests of America. If, on the other hand, Mr. Hoover had selected a seasoned and disciplined specialist from one of the great utility companies, the slaughter in the Senate would have been terrible to behold. Hence the President chose the only course open to him and selected colorless men for the Power Commission—men guiltless of positive opinions, at least as far as public knowledge runs.

But are they competent men for the place? Here an

answer can be made beyond all controversy. Three of them are not. One of the supreme tests of competence is capacity to get away with all that is to be got away with. In accomplishment—whatever the end—decorum, circumspection, and facility are indispensable elements. Before the ink had dried on their commissions, three of the new power board met hurriedly and fired bodily three outstanding employees of the old establishment: Bonner, King, and Russell. Bonner was known to have consistently favored rulings desired by the utility concerns. King and Russell had been found on the other side—interpreting the law strictly in the public interest as they conceived it. As all the world knows, this hasty and huddled action raised a storm, and discredited the commission with a large section of Congress, upon which it depends for its very existence.

Surprised or disgruntled by the Senate's reaction to this precipitate stroke of state, the chairman of the Power Commission made a thinly disguised attack on Congress in a public address, and the newspapermen squared away expecting a clean-cut fight on the power issue—the release of applicants for federal power rights from the narrow prescriptions of the Water Power Act. They were encouraged in their expectations by the general understanding in Washington that President Hoover himself had staged the battle and ordered the expulsion of the three “trouble-makers.” But just at the moment when the heavy artillery should have opened, orderlies came running with an authentic report that King was being restored to his position as accountant to the commission—indicating a hasty retreat on the part of the masters of the establishment.

This fumbling of the ball has concentrated the fierce light of newspaper scrutiny on the Power Commission. No other agency in the government is now so closely watched. It can hold no hearings, take no testimony, make no orders without raising apprehension. For instance, a mild and apparently innocuous hearing on minor leases, which would ordinarily have passed unnoted, broke into front-page news in all parts of the country. Why? Because, while journalists were watching every move, the commission with legal propriety refused to allow Mr. Judson King of the National Popular Government League to put in a word, through expert counsel, “for the people.” If the appointees on the Power Commission have no policy, they are a total loss. If they have a policy and cannot realize on it, then they are a total loss without insurance. However excellent, urbane, and civilized they may be—and there is no ground for criticism on this score—three of the commissioners are not fitted for their occupation. An omniscient person never sets fire to his own house. Tentatively at least, it may be said that Mr. Hoover's statecraft has failed him in this instance, lending color for suspicion with reference to his other appointments. And yet it must be said that this very same commission, in the New River case, completely flabbergasted the pessimists by administering a body blow to parties bent on dismembering the Water Power Act. So the earth seems uncertain beneath our feet.

In bringing a long story to a close, a word may be added about the Tariff Commission. It has been bruited abroad that there is a such a thing under the sun as a “scientific” tariff—one that can be taken out of politics and operated on principles of pure mathematics. Those innocents at large who believed in this marvel were, accordingly, distressed

when they read in the papers that President Hoover's new commissioners were not production engineers but earthly mortals and that even the Democratic members were tainted with protectionism. The sagacious editors of the *New York Times* were surprised to find a sugar Democrat on the honor roll and furbished up their best Latin aphorisms to give humorous point to their commentaries. But in all the adverse remarks there was a flavor of affectation. Are not the American people committed to protection? Look at the majority rolled up for Mr. Hoover and Mr. Grundy in 1928. And read again the Democratic platform of that year. Dr. Alfred Smith, spiritual heir of Thomas Jefferson, was shipwrecked on a plank sponsoring a tariff “based on the maintenance of legitimate business and a high standard of wages for American labor.” Without Democratic votes in Congress the tariff bill of 1930 could never have been enacted into law. Hence, when President Hoover selected the commission to make inquiries and recommendations for modifications in the inspired text, he quite properly felt warranted in loading the dice on the side of protection in the highest. To be sure, only two members of the establishment may be called “experts” in tariff making, but that is irrelevant, for most of the researches will be made by the employees of the board, not the mitered chieftains at the head table. Through the plain authorization of the people, the latter are merely instructed to make the tariff tighter by getting the facts required for the operation. After all, the only “scientists” in this field, upon their own confession, are the free traders who have rationalized an accident of British history into a system of political economy.

Whatever flaws may be picked in President Hoover's appointments in detail, there can be no doubt that they represent his fixed policy in the large. Several years ago, in a small volume entitled “American Individualism,” Mr. Hoover expounded his fundamental faith—individualism, in its “philosophic, spiritual, economic, and political phases.” After glancing back upon the welter of the war years, he declared: “From it all I emerge an individualist—an unashamed individualist.” While he expressed the belief that “we must soften its hardness and stimulate progress through that sense of service that lies in our people,” he quickly added that every individual “must stand up to the emery wheel of competition.” Strenuously did he object to “the perpetual howl of radicalism” to the effect that “it is the sole voice of liberalism—that devotion to social progress is in its field alone.” Radicals make the mistake of forgetting “that progress must come from the steady lift of the individual and that the measure of national idealism and progress is the quality of idealism in the individual.” Mr. Hoover was firmly convinced and openly declared that “the most trying support of radicalism comes from the timid or dishonest minds that shrink from facing the result of radicalism itself but are devoted to defense of radicalism as proof of a liberal mind. Most theorists who denounce our individualism as a social basis seem to have a passion for ignorance of its constructive ideals.” When a public man sets forth his views in language so clear-cut, appeals to the electorate on principles so candidly announced, and is victorious with the suffrages of millions, he may look with a certain amphibian coolness upon criticisms of his appointments, with justification contending that they conform in the main to policies already frankly proclaimed and approved by the people.

Russia Struggles On

By LOUIS FISCHER

Moscow, June 22

I HASTEN to record my first impressions. I have spent so many years in the Soviet Union that I no sooner arrive in Moscow than I begin to dig beneath the surface for the secrets of Bolshevik problems or policies and cease to be interested in the more superficial aspects of Soviet affairs. But these first ten days my eye is still fresh after six months' absence, and I have postponed studies to note what it sees—and what the ear hears.

My train from Riga came into Moscow on time. Strange, perhaps, that this should be put down as an achievement, but last year the railroads operated with Oriental unpunctuality. The dinner left much to be desired. The table cloths were old and yellow, the windows thick with dust, the waiters unkempt though extremely polite, and the dishes none too clean. Just elbow grease and some water would have made a sharp difference.

As I watch the flat Russian scene from my car window, a Soviet citizen engages me in conversation. He looks and talks like a professor. "We have everything," he is saying, "grain, wood, coal, water power, fuel, all the minerals—everything but brains." Dostoevskian self-flagellation! Another Russian joins us; they love to talk, these people. His manner is that of a Communist. "Yes," he interposes, "but now the brains are being applied. Our unlimited resources have at least found their exploiter. Think," he adds with growing excitement, "what all this emptiness will look like say twenty years from now, at the end of the fourth Five-Year Plan." "Four five-year periods," the professor sneers. "Perhaps four centuries." The Bolsheviks detest this type of skeptical intellectual; they have self-assurance and faith.

Everywhere from the border to Moscow we saw endless construction activities—new railway warehouses, new freight cars with Soviet machines mounted on them, numerous groups of wooden barracks testifying to factory buildings beyond, and around the capital itself whole new settlements, new plants, and much road-laying. In Moscow people are surprised at the amount of construction that is proceeding. Everywhere apartments are rising where formerly stood empty lots or one-story shacks built in the reign of Catherine. And yet the city still looks dilapidated and down at the heel.

There were no porters at the station. In my experience this has never happened before. "That's all right," a Communist woman friend said to me the same evening in my apartment; "it won't hurt you to carry your luggage yourself. The men are required for more productive labor in carrying out the Five-Year Plan." Russia needs more workers, even unskilled workers. The scarcity of labor will force the Soviet Government to hasten the tempo of mechanization.

The neighbors have been in to ask about Europe and America, and then to tell me their stories. Their interest is keen. Some display a deeper understanding of the economic situation in the United States than many an average American. "This is not America's last crisis," a worker

ventures, "but it will leave a bad scar. And Europe will take longer to get over the American depression than America itself." He has been told that, to be sure, in factory meetings. But he handles his knowledge intelligently. All are better versed in German affairs. They inquire, not very hopefully, whether a social revolution is impending there. I have nothing encouraging to offer. Nor are they sanguine. "So the world revolution is not coming yet," a housewife summarizes, shaking her head somewhat mournfully. The Bolsheviks have made the world revolution kitchen talk, but no one believes it is around the corner.

Now we grow more personal. Neighbor One, a woman office employee, has a second husband. Six months ago, while her old husband was absent in a G. P. U. prison, she had taken a young engineer unto herself. They lived in a single large room with her son of sixteen. At present the old man is free again and is back in the same room. So the four of them are in occupation, and the bed of each is screened off from other sections of the room by pieces of furniture. But the old man expects to find another apartment. Neighbor Two, a government official, shared two rooms with her brother. They had a maid. The relations between him and the maid were already quite intimate when I left Moscow last winter. Since then the sister, in a rage, has dismissed the girl and evicted her brother. The maid has found employment with Neighbor One. Neighbor Three—a workingman—is a newcomer. His small room was formerly occupied by a proletarian with wife and child. Now they have moved to a modern cooperative apartment house where they own two rooms and a private kitchen. Today's newspaper says that one million workers and their families have obtained living quarters in new apartment houses during the last five years. Since 1926, 29,000,000 square meters of floor space have been made available for dwelling purposes in newly constructed buildings throughout the country. Of this area 10,000,000 square meters were built in 1931. Further, the wife of Neighbor Four has divorced him and married another. No change in Five. Our own domestic worker, as a servant is styled in Soviet terminology, is a delightful peasant girl. Half a year ago she was thinking of taking a job in a factory. "One is freer," she used to argue. "And then I will belong to the privileged class." Now she is content to remain with us, for if she quits and registers on the employment exchange, she will likely be offered work not in a factory but in one of the new agricultural cooperatives, and she has had enough of village life.

I discover that the public is discussing a brand-new topic—the next Five-Year Plan. In the second *Piatiletka*, I am told, the nation will reap the benefits of the first. From 1929 to 1932 the foundation is being built: basic industries which supply coal, ores, power, fuel, and transport, as well as goods chiefly for export. But in 1933 the superstructure will commence to rise. It will yield clothes, more and better food, additional housing facilities, and comforts. In other words, the seers who prophesy that the Communists

will be swept out of office at the end of the first Five-Year Plan when the population realizes that its sacrifices have not resulted in an appreciable improvement of its well-being are wrong again. For the masses nurse the promise that relief and prosperity are two years off. Then, in 1933, the four years' "war" will be ended. The view one hears abroad that the present generation must pay for the joys of the coming generation would not be very popular here. The living await their reward in short order. The successes of collectivization have given them heart. Crop prospects this year are again excellent. There is ubiquitous and overwhelming evidence of industrialization. The absence of unemployment is a measure of the huge amount of work being accomplished. The fruits of all these efforts must come quickly. People, I find, really believe this. There is none of the despair and muddling-through spirit frequently encountered in Europe. On the contrary, the men and women I meet are hopeful despite all their grumbling.

Yet life is hard. With some exceptions, my acquaintances look worse than they did six months ago. They are paler and thinner. The physical and nervous strain of remaking a backward country wears on them. The symptoms of this wear are undeniable.

Lest a false impression be conveyed, it must be stated that nobody starves. The population of the entire country, however, suffers from insufficient food, from the poor quality of food, and from lack of variety. Those who have money, and many have, can buy almost anything. The private, non-cooperative markets are well stocked with supplies brought into town by the peasants and hawked by them on street corners and in the bazaars. Prices are exorbitant. Yet comparisons in foreign currency are false. Yesterday I halted in front of a store window on the Tverskaya. Women's woolen sweaters were displayed at 64 rubles each. One immediately says "\$32," and recalls that a similar article could probably be purchased abroad for \$3. But as I stood, a couple stopped at the window, and the man, who seemed to be a state employee, said: "Sixty-four rubles. That's not so expensive." It is altogether misleading to translate Russian ruble quotations into foreign currency; the ruble does not represent fifty cents in buying capacity.

My friends tell me that most of their earnings now go into the kitchen. Only occasionally do they spend on clothes. Rent and amusements are generally cheap, while luxuries are non-existent. Food takes all the money.

Despite the universal shortage, Russians are complaining less about living conditions than they did before. Some have grown inured to their troubles and regard them as temporarily normal. Others, especially the many thousands who are attached to "closed" cooperatives or have received new apartments, are better situated. The commonest subject of complaint is no longer food. It is work. Of course people could give more service if they received richer nourishment, so that the two questions are not unrelated. But in conversation the first grumble deals with the strain of office and factory employment. Collectively and individually the Russians are accomplishing more than at any time in the history of the nation. The lackadaisical Slav never exerted himself at his job. Now, in this period of stress, he is being asked to place his last ounce of energy at the disposal of the state. He never knew how to work, and he must learn in a hurry. Slacking by one man or by a single production unit

usually raises a storm of protest which may immediately find expression in public announcement or in newspaper denunciation. The pressure of mass opinion is readily applied to stimulate maximum effort. But an important cause of overwork is inefficiency, duplication, bureaucracy, and a mechanical striving toward paper results rather than toward real achievement. This and factory management, I am convinced, will soon stand out as the chief problems of the Soviet state.

"L'état, c'est moi." The speaker was a Leningrad student on a visit to Moscow. She had been telling me of her social work. "You see," she elaborated, "I am the state. All its problems, troubles, and triumphs are mine." I had told her of the preoccupation of some Americans with psychoanalysis and glands. She wrinkled her short Russian nose. "Our minds are turned outward," she said. "I would be bored to death if I had only myself to think and take care of. We are heavily burdened with all sorts of extra assignments. They tell us we must sacrifice for the state. But what is the state? It is I, Ivan Ivanovich, my fellow-students, and my family. Then I sacrifice for myself. If it won't last too long," she added with a pretty smile, "I shall not object." I know that she will soon be demanding returns from the Bolsheviks. And this girl and others will strongly disapprove if the government passes dividends too many years in succession.

"Don't you find that we are better clothed this year than last?" she asked. I had noticed that people wore better shoes, and above all that the queues, that bane of the housewife's existence, had almost entirely disappeared. "I have a new dress," the girl student added, and then the "state" commenced to describe its ruffles, its pleats, and the special cut of its collar.

This girl and two boys I have met in the last week do not want to join the League of Communist Youth (Komsomol). This is about the most unfavorable symptom I have encountered in Russian life in years. The new generation should feel itself attracted to the two-million-strong organization which is the junior reserve of the Communist Party and which trains the future leaders of the country. Membership in the Komsomol used to be regarded, and is of course still regarded by many, as a distinction. The Komsomol door is not wide open. Thousands knock for admission each month. But the fact that even a few who are ideologically Bolshevik should turn their backs on the Komsomol points to the existence of a very serious defect. If I were to pool the arguments I have heard against it, the accusation would read more or less as follows: The Komsomol roars loud slogans about the "building of socialism," but actually many of its members are politically dishonest. They aim not for a real moral and social rebirth but for effects that can be expressed in statistics and reported to higher authorities. They do not think. They become automatons. Komsomoltsi are frequently the worst students in the universities. And they are weak on Marxist theory as well. If these things are true in even small measure, the Bolsheviks will be well advised to look to the moral fiber of the people whose material conditions they seek to improve. A new healthy psychology is undoubtedly in the making in the U. S. S. R., but it may be tainted at birth by the unfortunate spiritual concomitants of a difficult struggle for existence.

The Postage Stamp Goes Republican

By C. J. HUBER

POLITICAL parties must work in sundry ways to keep a tired public amused and entertained. With characteristic inventiveness, knowing America's love of sport, some of our leaders have introduced a most amusing game, played on a national scale with stamps. This game, pleasingly called "Special Issues," is already bringing recreation to thousands of sturdy Americans, in and out of Congress. The object is to get the right kind of Special Issue, depending upon your wants or, if you are in office, the wants of those who elect you. It is wholesome sport, often of an astonishingly droll nature; and the stakes are high.

"The established policy of the Post Office Department," said Postmaster General Brown, "has been to restrict special stamps to commemorate anniversaries of important historical or industrial events of national interest." Now the purpose of the game is to make that statement sound absurd. The funnier you make it sound, the better player you prove yourself. For example, the participants who won the following issues surely qualify as experts:

Huguenot-Walloon tercentenary
Voyage of the Sloop Restaurationen
Death of John Ericsson
Surrender of Fort Sackville
Battle of Fallen Timbers

Among other Special Issues for which men have asked, keeping a straight face, are these:

Issuance of the first "homestead papers" at Beatrice, Nebraska
The Great Salt Lake
The wounding of Lafayette
The life, works, and death of Ephrata Cloister

These lists should be enough to give the reader a fairly clear notion of what one may reasonably try for. It is not at all necessary, of course, to play this game for the fun of it. Like other games, it may be played for the honor of the club, the State, the country, or the Old Home Town. It may even be played professionally—for votes. For example: in 1924 the Honorable Peter Norbeck of South Dakota and the Honorable P. J. Kvale of Minnesota sponsored the following resolution in Congress:

WHEREAS, The sloop Restaurationen—the Mayflower of the Norsemen—on July 4, 1825, sailed out of Stavanger harbor, Norway, with fifty-two emigrants on board; and

WHEREAS, This vessel, after a perilous and romantic voyage through the British Channel and by the way of the Island of Madeira, reached the port of New York on October 9, 1825; and

WHEREAS, There are now approximately 2,000,000 descendants of the Norsemen in the United States, who have been an important factor in developing large sections of our country . . . therefore be it

Resolved, etc., That the Postmaster General is authorized, and he is hereby requested, to design and issue a special postage stamp of the denomination of two cents (in recognition thereof).

For these two millions of sturdy Nordic votes the Post Office Department printed an attractive two-cent stamp with the Norwegian Mayflower on it, as requested, and for good measure threw in a five-cent value, illustrating an early Viking ship of a long, rakish design coming out of Stavanger harbor with a bone in her teeth—and the American flag floating along to windward. The flag caused much excitement. Many people were unreasonable enough to ask the department why a tenth-century Norse ship should be carrying the Stars and Stripes, but deftly the postal authorities explained that the illustration was not really a Viking ship, but only a replica of a Viking ship, sailed over the Atlantic to these shores in 1912 or thereabouts by several hardy Norwegians bent on proving something or other. Asked why a replica was chosen for the design instead of the real thing, the department sought refuge in its dignity and refused to answer.

Although the game of "Special Issues" was not originated by the sponsors of the Norse issue, credit for putting it on a profitable basis should go to them. It was readily seen by the colleagues of Messrs. Kvale and Norbeck that some excellent publicity was lying around waiting to be picked up. Between 1920 and 1925, the year in which the Norse stamps appeared, five special issues were prepared for a grateful public, and between 1925 and 1930 twenty were printed.

The game of "Special Issues" had arrived. Doughty Congressmen girded up their loins and journeyed forth into the Everlasting Hills in search of historical mammoths. Most of them returned with nothing more than a mouse, slightly spoiled by time, but several exceedingly queer species of small game were turned up. The Honorable Charles J. Esterly of Sally Ann Furnace, a whistle-stop in eastern Pennsylvania, bagged two events worthy of enshrinement in the heart of the nation—the hiding of the Liberty Bell at Allentown and the arrival at Cambridge, Massachusetts, of Captain Nagle's Company of First Defenders, of Reading, Berks County, Pennsylvania.

Not to be outclassed by the gentleman from the East, the Honorable Charles Tatgenhorst, a Representative from Ohio, solemnly arose on the floor of the House and pleaded with his colleagues that the hundredth anniversary of the establishment of building and loan associations in the United States be immortalized via a special issue of stamps. Should the nation pass up a chance to commemorate the first run of a locomotive in America? Senator David A. Reed introduced a bill in Congress requesting that stamp. Representative Hickey of Indiana thought it would be a mighty nice thing for the Post Office to honor the two-hundred-fiftieth anniversary of the landing of René Robert Cavalier de la Salle on the soil of St. Joseph County, Indiana.

The Honorable William R. Eaton of Colorado, after thumbing over several ponderous histories and the files of the *Denver Post*, gave up in disgust. It seems that his native State boasts of some mines, part of a river, several mountains and sanitariums, but no history. Nothing of any

consequence, he mourned, has ever happened in Colorado and probably nothing ever will. In view of this sad state of affairs, Mr. Eaton had a sporting proposition to offer the Post Office Department: would it feature the Mount of the Holy Cross, a natural phenomenon in the back stretches of Colorado, at the first available opportunity?

When the city fathers of Nashville threw a celebration in honor of its founding, Representative Byrns of Tennessee arose to the occasion and introduced a resolution in the House asking for the usual issue. It was referred to the Committee on Post Offices and Post Roads, and there hastily strangled. Indignation ran high on the part of the gentlemen from the North and several mass meetings were held at which the Representative from Tennessee was denounced as a public enemy. Friends tried to excuse his action on the grounds of ignorance and thoughtlessness, and made out such a good case that it was decided by the Republican Party to let Mr. Byrns off with a good knouting. So a number of the Old Guard, led by Charlie Curtis, took Mr. Byrns into a corner and explained to him several natural laws and axioms. Did he not know that it was indecent even to mention the South in the presence of his betters? Did he not know that said region was barren of historical events, being noted only for tenuous things such as the quality of its gin, the grace of its horseflesh, and the purity of its womanhood?

Mr. Byrns pointed with a certain measure of pride to the high lights of Southern history, dwelling fondly on several specific items in the records, and wound up with a few stirring references to his own glorious State, asking permission in an absent-minded way to have the latter read into the *Congressional Record*. One of the more literate Senators read to the gentleman from Tennessee a complete list of the commemorative stamps issued in the last decade, and pointed out to him that none of them were in any way connected with the South. States, cities, and regions, the battles, the nationalities, the famous and the near-famous—all so honored were of the North! Mr. Byrns said in a pathetic way that his was a very special occasion—the birthday of a majestic city, in fact—and not to be confused with the ordinary run of events.

"You are asking us to set a precedent, Mr. Byrns. We are sorry; it is utterly impossible." With these words the gentlemen from the North departed, leaving an ache in Mr. Byrns's heart and a memorandum in his hand which read: "It is the will of Allah that no stamps be issued in the name of the South, for it has nothing worthy of being so honored."

Democrats claimed that the Post Office Department was playing politics with our stamps, and a whispering campaign to that effect crept slowly through the Capitol. The Grand Old Party snuffed at the very notion and said that no intelligent person would believe that it had ever taken an unfair advantage of the South. To prove it, a stamp commemorating the founding of the Carolinas was issued by the Post Office last year. It was a gracious move on the part of the government and removed any suspicions of sectional log-rolling from the mind of the South. North Carolina bolted from the Democratic Party in 1928, but nobody has claimed that this fact influenced the department's action.

The Carolinas made the most of this golden opportunity.

Everything but the family laundry was thrown into the design. Some of the finer points of Carolina history have been explained by the artist, Mr. H. F. Church, in a letter appearing in the issue of June 5, 1930, of the *Stamp News*:

The figures of the militant colonial governor and the friendly Indian are respectively Governor Joseph West, the incumbent at the time of the official establishment of Charleston on its present site, and Shaddoo, the Kiawah cassique, through whose efforts the colonists were induced to make the original settlement at Old Town Creek across the Ashley from the present site of Charleston.

The two boats in the harbor depict the removal of the colonists from the old site and the arrival of the Huguenots in the year 1680. The palmetto tree overhanging the central group is, as you know, the South Carolina State emblem, while the sheaf of rice to the left of the design and the sheaf of indigo to the right are symbolic of the two crop staples which made up the bulk of the early colonial exports.

Twenty-five million stamps were printed by the Post Office Department and placed on sale in April. The tar heels and the conches dropped their squirrel guns and came flocking down from the mountains in such large numbers after the little messengers of good-will that the entire issue was sold out in six weeks.

The series of stamps in use today was designed in 1922. It is composed of twenty-five denominations, from a half-cent to five dollars, each bearing a different design. Presidents, famous men, buildings, symbolic figures, bits of scenery, and even an animal—a bull buffalo—were chosen for subjects. The North is represented by Niagara Falls, the West by the Golden Gate, the East by a view of the Statue of Liberty in New York harbor, and the nation as a whole by both the aforementioned bull buffalo and the goddess America. The South is conspicuously represented by nothing.

Since most of the illustrations on our stamps have not been changed for a decade, a new set of designs would now be acceptable, if for no other reason than to bring these thumb-nail sketches of the country up to date. Even Niagara Falls is somewhat changed in appearance from 1922. A small list of subjects is herewith offered for the approval of the Post Office Department and the Republican Party:

A stirring etching of the good ship Prosperity thundering out to sea with the Great Engineer at the throttle would look fine on the one-cent. An elephant, a dinner pail (full), and a hair shirt trimmed with red ribbons would do nicely for the two-, three-, and four-cent respectively, while Senator Jones should be placed on both the five- and ten-cent values and possibly a pint of Overholt on the two-dollar. A logical subject for the half-cent would be Mr. Volstead, but it is rumored that a certain New England man, a sage and a columnist of high standing on the Republican roll book, is having this space reserved for himself.

Although there are serious objections to the party custom of using the Post Office Department as a political pigskin, twig-rolling in the form of special commemorative stamps is such a harmless form of statesmanship that we can be philosophical about it and decide that our Congressmen could be doing a large number of things more harmful. And if our Senators and Representatives are kept amused through such innocent sport as boosting the home town, they will undoubtedly attend to our welfare with more gusto.

In the Driftway

TWO black boys from Uganda in Central Africa have been brought to New York, along with three gorillas, a couple of chimpanzees, and other assorted animals, by Mr. and Mrs. Martin Johnson. Although the boys have as their duty the care of the animals and sleep by preference at the zoo, they have spent some of their time sight-seeing. They were fascinated to see that Americans built their nests in high buildings, like birds in trees; the sight of an elevated train high in the air "without a head" amused them beyond words; and they could hardly believe their eyes when they saw persons of their own color who actually owned automobiles, the scale of wages in Uganda being such as hardly to justify so exalted an expenditure.

* * * * *

THE Drifter is always interested in this revelation of American life to persons to whom it is almost totally strange. What odd fellows we must seem to them, and how much more sensible their own manners and customs must appear by comparison. We not only build our nests in trees, we transport ourselves beneath the earth. Plunging down a dark and ill-smelling hole, we dash headlong among our fellows, we drop a round metal object into a machine that whirls us around into a seemingly interminable tunnel, we push our way on to a conveyance that provides nearly every possible inconvenience in the way of heat, dirt, and congestion, and emerge presently to be plucked upwards by a cage that lands us among the tree tops where we perform our daily tasks. We take our work hard and our pleasures harder. By hordes we seek diversion—under bright lights where there is more crowding and less air, by the sea which is black with people, in stuffy buildings where, on a silver screen, we watch men and women going through exactly the same motions that we might be expected to wish to escape from. We eat, sleep, and make love in a hurry. When we are still, it is usually because there are so many persons around us that we cannot move.

* * * * *

THE green and silent tunnels of the jungle seem very inviting by comparison. In them there are no trucks with screeching brakes, no bawling radios, no tabloids, no cigarette advertisements, no bathing-girl contests, and no gentlemen with Presidential aspirations. There are, if accounts be accurate, only lions roaring gently, and certain insects, and a few minor inconveniences in the way of fever and snakes and heat. The Drifter confesses at times to a hankering for the jungle. Failing that, there is much to be said for joining the Uganda boys at the zoo. One is in a cage, to be sure, but with a little work of the imagination one might easily be persuaded that the cage was freedom and the rest of the world was imprisoned. One side of the bars may be as free as the other. Thoreau, imprisoned for refusal to pay his poll tax, was visited by one of his friends. "What are you doing in there, Henry?" he was asked. "What are you doing out there?" he replied. There is much to ponder on in that answer.

THE DRIFTER

Correspondence

Mr. Simonds Excepts

TO THE EDITOR OF THE NATION:

SIR: As a faithful reader of *The Nation* and as a contemporary pilgrim of Mr. Villard's in his recent hegira, I find myself frankly bewildered by your present utterances in respect to the German crisis. This bewilderment arises from the fact that I cannot make out whether you hold it more important that France should be punished or Germany saved. Certainly only one of these possibilities can be realized.

Everyone who has been in Germany in recent months, and I spent much time there last winter, knows the gravity of the situation, the immensity of the suffering, and the universality of the despair. Nevertheless, if I spent time in Germany, I also spent an equal amount in France, and in both countries I devoted my days and nights to the study of the feelings of the people even more than to the examination of the policies and opinions of statesmen. The result was that I found in France just as general and unanimous a view as in Germany. When the present German Cabinet announced the program of tariff union with Austria, it instantly and effectively abolished all present hope of French cooperation in any work of economic or financial salvage in Germany. This declaration, following upon that of Treviranus in the matter of revision of the eastern frontiers and also upon the Hitler explosion of the September elections, awakened a feeling in France which can only be compared with that which prevailed just before the occupation of the Ruhr and just after the close of the World War. The French people were aroused, and the first consequence was the defeat of Briand and the second the attitude of the Laval Cabinet in the matter of the Hoover proposal.

Having seen personally the extent of German misery and knowing the degree to which this misery would be accentuated either by the arrival of a fascist dictatorship or the less likely transitory triumph of a Communist *Putsch*, my conviction is that the all-essential thing today is to save Germany, and the single possible means of achieving this end is to bring about some modification of French policy, which directly involves bringing about some change in the French state of mind.

Since the war Germany has had one statesman, and the real greatness of Stresemann lay in his perception that the price of German recovery was a truce with France. He paid that price in the Locarno agreements, which recognized the Franco-German frontier as definitive and pledged Germany not to seek by force the revision of the other boundaries of the Reich. For four years thereafter Franco-German relations steadily improved. The Ruhr was evacuated, then the Rhineland, five years in advance of the treaty date, and, finally, the Dawes Plan was modified to the Young Plan, a step which failed to produce good results only by reason of the world depression. Then Stresemann died, and with his death his policy lapsed. Those who followed, influenced by the rising nationalistic spirit of the youth, were led step by step to adopt precisely those policies which Stresemann had wisely recognized were beyond the present capacity of Germany to realize. And as German policy changed, French spirit was modified, until you arrived at the present impasse. But the physical factors did not change, or rather such change as they underwent was all to the advantage of France, whose financial and economic position improved precisely as that of Germany declined.

Today we are again just where we were in 1923, when the French troops were in the Ruhr and the German resistance had led to the inflation crisis and the financial ruin and eco-

conomic prostration of the Reich. All the American and British protest and disapproval of the Ruhr occupation did not save Germany. Short of the employment of force by those two nations nothing could. And the same situation exists today, with Britain and the United States far less advantageously placed than seven years ago. In the Ruhr time Germany, having been defeated in her contest, surrendered. She abandoned political purposes beyond her strength and realized economic recovery as a consequence.

Is there any escape today from a similar postponement of political purposes? Even if *The Nation's* view of the territorial and other provisions of the Treaty of Versailles on the moral side be accurate, is it not clear that neither today nor tomorrow is Germany going to be able to achieve revision, and on neither day will America and Britain go to war to aid Germany in this purpose? But to encourage the German people now with the daily emphasis of the moral wrongs and injustices of the treaty terms is to sustain them in a state of mind which can only bring them to ultimate disaster. Union with Austria, revision of the eastern frontiers, abolition of reparations payments—none of these things are beyond the limit of possibility in the future, if Germany shall recover, but while Germany now demands the immediate realization of all these ends, her recovery is not going to take place because the peoples threatened by these projects can and will prevent it.

Mr. Hoover's intervention, designed to prevent German economic collapse and political ruin, solidified French opinion because it was unaccompanied by any parallel effort to obtain from Germany a renunciation of her political purposes. And this solidification of French opinion was immediately disastrous to the Hoover project, since it destroyed its psychological effect and so far from bringing about a new spirit in the world disclosed the persistence of the old.

I do not think anyone can be more keenly alive to the tragedy of the present German situation than I am, after many weeks spent with my German friends and after every sort of proof of their sufferings and their misery. But because I believe that the present German policy means far greater misery and suffering, I find myself at odds with *The Nation*, the effect of whose policy is to encourage the German people in the hope that what they conceive to be justice can be had now and is assured by British and American concern for right and fair play. All my sympathy is with Germany in her present plight, but all my knowledge of European circumstances, whatever of value that may have, warns me that Germany can only be saved as France is made to feel secure.

Letter Never Sent

By EDA LOU WALTON

Whatever there was of lack in me
Shall grow more desert-calm and cold
Knowing the long night come, the story told,
The first dark prayer granted bitterly.
That I should have your body were enough;
Out of this wonder was the vanished stuff
Of sheer dream woven; where was the last dream sold,
Over what tender shoulder draped illusively?
To whom have you given them, those hours of night
That blossomed rich and are blown over with sand?
What lips could mean so little, what unsteady hand
So little to you, for whose rare delight
Was all this taken from me? What tall girl
Unwinds the long gold circling of a curl
With shaking fingers; what throat have you fanned
Tonight with the wisdom of your sight?
You who have seen me thus and never seen
How all that was forbidden could break over
Like some great wave, nor would I run to cover,
Seen how this body stretched where waves have been,
More dead than any shell whose life is eaten,
Turns on each tide, is by each new tide beaten;
You who have seen, can never see, now hover
Over some new shell on a beach washed clean.
You will remember only how a woman
Offered no lamentation, was never given voice
To cry out in the wilderness, by choice
Was dumb and lovely and most gently human,
Placing her hand upon your hair, she said
Never a wistful word that could not be unsaid.
Words are like birds, never may they rejoice
Save on the wing outgoing or incoming.
I am so calm, I have not even spoken
Your name that was emblazoned on my tongue,
Deplored not silence, bannered not the wrong,
Nor will acknowledge golden vessel broken.
No urn, no urn! The flesh endures the blow
And stands more exquisite where seedlings grow
Into the flower of parting. Take this song
Unsung, these songless lips, for token.

More Portraits by Strachey

Portraits in Miniature. By Lytton Strachey. Harcourt, Brace and Company. \$2.50.

A BIOGRAPHY," writes Mr. Strachey in one of these exquisite thumb-nail sketches, "should either be as long as Boswell's or as short as Aubrey's. The method of enormous and elaborate accretion which produced the 'Life of Johnson' is excellent, no doubt; but, failing that, let us have no half-measures; let us have the pure essentials—a vivid image, on a page or two, without explanations, transitions, commentaries, or padding." The present volume, as if in illustration of this dictum, is composed of a score of biographies and portraits as short as Aubrey's; but this does not prove that

Mr. Strachey takes his own pronouncement quite seriously. He has never written a biography as long as Boswell's, and there is no reason to suppose that he ever will. But he has now written biographies of every *other* length. Among the problems that fascinate him most as a literary artist are those of exclusion and of scale. In "Queen Victoria" and "Elizabeth and Essex" his scale was that of the average modern novel; in "Eminent Victorians" it ranged from the hundred-and-thirty pages devoted to Manning to the thirty-five allotted to Dr. Arnold; in "Books and Characters" it was somewhat smaller; here it almost literally becomes the vivid image "on a page or two." Mr. Strachey, in brief, has hewn statues and cut cameos, and in every scale he has shown himself to be incomparably superior to any contemporary rival.

Has he his limitations? Yes, if one must speak of them. There is, it is true, a certain sameness of tone in his approach; his irony, perhaps, is too insistently present. His characterization, no doubt, is here and there too bold—goes just a little beyond what his knowledge of substantiated facts would altogether justify. Perhaps, also, this brilliant skill and enchanting style are now and then supported by certain tricks. Mr. Strachey is possibly too fond of deathbed pictures (though that should be forgivable in a writer who can do them so magnificently); and his subjects are perhaps too much given to gazing into the fire as old age creeps upon them. Readers of "Queen Victoria" will recall how the Baron, when Victoria declared with passionate conviction that she would carry on her dead husband's work, "smiled a sad smile and looked into the fire." In the score of portraits in the present volume, I have counted no fewer than three more characters who brooded or dozed over fires. But it is always a charming picture, and could there be a more vivid symbol for portraying the memories or regrets of those whose lives are passing into the twilight?

No, I should prefer to have someone else talk of Mr. Strachey's limitations. If there are tricks in his technique and style, their secret is well guarded; he is still the only biographer living who seems to know precisely what they are, and to be master of all of them. Is he "decadent"? Then so much the better for decadence, whatever that may be. To quarrel with Strachey because he will never write like, say, Carlyle, or Joyce, seems to me merely silly: it is the ancient critical error of discussing the swan as if it were a defective sort of eagle. Mr. Strachey brings his own heady flavor to everything he writes. It is not only his sympathies that are with the eighteenth-century classical writers; his qualities, too, are the great classical qualities with which he credits Gibbon—order, precision, lucidity, urbanity. To these we must add, of course, an irony of the type that also reached its finest flower in the eighteenth century, a muted irony, almost omnipresent, as we have seen, but never labored. Like all great ironists Mr. Strachey is willing to take the chance that half his irony will be missed by the majority of his readers. He insinuates it with the least possible emphasis. One could almost write an essay, indeed, on the cleverness of his punctuation alone: where a bad writer would hammer in an exclamation point, and even a good writer would put a period, Mr. Strachey is content to let fall a comma, and to glide along as if almost unaware of what he had just said.

In the course of these sketches Mr. Strachey remarks that while the historian must have a point of view, a point of view by no means implies sympathy, and one might almost say that it implies the reverse; and he proceeds to give instances of the curious fact that so many great historians have been "at daggers drawn with their subjects." He is, of course, himself a notable addition to the list. He was more successful with Victoria than with Elizabeth, because he respected Elizabeth more. In the present volume his essay on Hume is admirable, his

essay on Gibbon even better, but his essay on Macaulay, because it is least sympathetic, surpasses them both.

These "Portraits in Miniature," aside from those on the historians, are concerned mainly with minor celebrities, chiefly of the seventeenth and eighteenth centuries—Sir John Harington, the inventor of the water closet; Madame de Sévigné's cousin; Dr. Colbatch, the Abbé Morellet, Mary Berry, Madame de Lieven, and the extraordinary prophet Muggleton, who founded a sect that lives to this day, and still sings,

I do believe in God alone,
Likewise in Reeve and Muggleton.

We should not overlook, either, the *Président de Brosses*, "the man who got the better of Voltaire," and on Voltaire's own ground: he was an able person, but a fatalist might easily believe that his chief reason for existence was that this delightful sketch of sixteen pages might some day be written. In all these minute biographies we get an extraordinary sense of the times as well as of the man; and the author leaves the impression that, had he wished, he could have written an entire book on almost any one of his subjects without further research. The best of these portraits are, in short, little masterpieces.

HENRY HAZLITT

The Eternal Adolescent

The Pure in Heart. By Franz Werfel. Simon and Schuster. \$3.

THE theme of Franz Werfel's new book, so his publishers announce, is the dilemma of the spiritual man in our present-day non-spiritual universe. This seems far enough from the point of Herr Werfel's occasionally penetrating and more often tedious narrative to raise the question of when a "spiritual universe" existed. It is a little bit unfair to the reader to reduce the book in advance to the level of a flavorless commonplace. "The Pure in Heart" reflects, throughout, the images of an adolescent mentality, and its major appeal, like that of Rousseau's "Confessions," must be to the eternally adolescent.

There is passion of a sort in this book, there is an occasional strain of lyric beauty; but it is the self-explanatory passion of a soul lost and fumbling in the world. Or, if one cares to analyze it further, it is the story of a man who has never got over his childhood love and need for his nurse; whose whole life is a straying away from and drawing close to that ancient, protective symbol; who, in other words, has never grown up and seems never to expect to. It is, moreover, a highly subjective story, fitted loosely into a general framework that is ill adapted to carry it; and like so many subjective treatises it is tiresome.

This, then, would seem to reduce the "dilemma of the spiritual man in our present-day non-spiritual universe" to the rather bleak question of how to grow up. Ferdinand R., which is as far as we get with the hero's name, is a character unfortunately rendered from the inside out. When the narrative opens, he is a ship's doctor on a large passenger steamer; when it closes, he is again a ship's doctor, and his life in between is lived in the book. This is not an ingenious frame for an occasionally hysterical narrative, but it does allow the author a free hand to probe and question as he pleases. The scenes of the hero's childhood are finely etched and vivid, the rest of the book concerns his adolescence, his mistreatment in a cadet school, his experiences in the war and in revolutionary Vienna. This is a story that has been told often enough before, and a good deal better. And if the tale has any real point or "moral" at all, it must impress the judicious reader as more unfortunate

than otherwise that a grown man must love no other woman but his nurse to the end. In that sense Franz Werfel's conclusion is a rationalization—whether specious or profound is a matter for the reader's discernment:

All human relationships, the most natural even, are illusion. We can neither love nor possess anyone else, since humans are forbidden to interpenetrate, and the best we can manage is to touch. Love is our faculty for developing the image of another passionately in the darkness within ourselves. Reality is an album of pictures, words are the instruments of division, the rush of life the dearest of all solitudes. All this is so easy to say.

EUGENE LÖHRKE

Liberals on Horseback

Behold America! Edited by Samuel D. Schmalhausen. Farrar and Rinehart. \$5.

"BEHOLD America!" is a symposium by thirty-three well-known American writers. Now symposiums, even by well-known writers, are usually more profitable than entertaining. Specialists are likely to be uncommonly dull as well as uncommonly wise. And even in the best of symposiums the flow of eloquence and learning will be suddenly halted by an article from some dreadful dub included through the mistaken tolerance of the editor. "Behold America!" is not open to these customary strictures. It is a stirring volume and gains steadily in interest as it proceeds. One gets from it a definite picture of this complex thing called America, hag-ridden by the industries that are both its glory and its shame, and one also finds a definite attitude taken toward the picture by nearly all the contributors. It is the character of this unanimity which is perhaps the most significant thing about the book. This appears most clearly in contrast with a superficially similar work that appeared about nine years ago, "Civilization in the United States: An Inquiry by Thirty Americans," edited by Harold Stearns. That earlier volume was one long outcry of surprised and embittered idealism; the contributors were too shocked, too disheartened and bewildered by what they saw, even to have any hopeful dreams. "We never amounted to anything, and we never will," they seemed to cry in their despair. The picture presented in "Behold America!" is fully as dark, but the tone, the mood, is, for the most part, very different. In the first section, entitled America: Promise and Fulfilment, Harry Elmer Barnes, Robert Morss Lovett, Robert Herrick, and others look back upon our dead past as one looks upon a murdered kinsman; their outcries are less elegiac than warlike. As the book proceeds to its detailed discussion of the present, there is a steady-eyed facing of unpleasant facts, as a mountain climber counts the crags above him meaning to surmount them. There is no cheap optimism, but there is what is much better, firmness in the long hour of defeat. Thus T. Swann Harding discusses the profession of the law that has ceased to be a profession save in name, and Ernest Gruening the journalism that has not become a profession save in name; thus John T. Flynn writes of Wall Street, Abraham Lefkowitz of secondary education, Louis Boudin of the dictatorship of the judiciary, and Robert Dunn of our imperialism that "goes marching on—to war." There are good articles on the Negro problem by George S. Schuyler, on censorship by William Seagle, on America's cults by Joseph Jastrow, on the Myth of Law and Order by Roger Baldwin. The thirty-three authors of the book are as one in the condemnation of the results of our private capitalism; they are almost as one in envisaging an ideal which Samuel Schmalhausen finely describes as "cultural communism." Such agreement is not the result of political unanimity, for the

authors stretch all the way from the liberal right wing, represented by Henry S. Canby, who bases his hopes on an aroused minority, to the radical left wing, represented by V. F. Calverton, who counts on an awakened proletariat (although this is only one point in his long and very able article on Social Forces in American Literature). At the moment Mr. Canby would seem to have the better of it, since the aroused minority actually exists while the awakened proletariat is only a mystic hope; but perhaps the ineptitude of our political and industrial leaders may be safely trusted to give Mr. Calverton his revolutionary proletariat in time. Meanwhile, at any rate, the right and the left wing represented in "Behold America!" belong to the same army. And the army is moving. Everywhere in the book one feels the sense of impending change. The change may well not be for the better, it may be for the worse. But at least it will be a change in which the real thinkers of the country will again have something to say. The liberals or radicals—call them which you will—are once more on horseback.

All this makes it the more regrettable that there is in the volume no direct frontal attack on our main industrial problems. Articles on our oil, coal, and steel and iron industries, on our banking system, and, above all, on our public utilities seem demanded by the whole tenor of the book. Surely no one can adequately behold America without an examination of the way in which our basic industries are conducted. Similarly, it is regrettable that our actual attainments in certain fields other than industry do not receive more attention. Contemporary American painting deserves more than a portion of a single page, and American architecture assuredly deserves a separate chapter. Although the dismal failure of our high schools and colleges is the outstanding feature of the educational scene today, that is no reason for disregarding the actual gains in elementary education or neglecting the promise of our "experimental schools." Perhaps after a few more seasons of financial depression the general American smugness and complacency will be sufficiently shattered so that even liberals may venture to say one or two kind words for their country. Until that time they will doubtless continue to feel the need to apply the strongest kind of stimulus to rouse the nation from its sleeping sickness. We can hardly expect in the near future any more balanced picture than that presented in "Behold America!" Rather, we may expect an increasing number of its own kind—fearless, undespairing, calling to us to face new unhappy, nearby things and battles still to come.

ERNEST SUTHERLAND BATES

Logic and the Sciences

The Logic of Science. By Harold R. Smart. D. Appleton and Company. \$2.50.

THIS little volume by Professor Smart is intended to illustrate the many interrelations between philosophy, logic, and the sciences, with particular attention to the metaphysical and conceptual implications in each. The lay reader with more than a casual interest in this very complex subject will find much to reflect upon in the first two chapters, which discuss the theory of knowledge as affected by the scientific approach to "reality." A long discussion of mathematics (which, with logic, is the author's special field) shows the increasing tenuity of mathematical thought, whose dependence upon symbols is at once its power and its weakness; the present situation in physics is analyzed, emphasis being laid upon the subtle confusions resulting from the many brilliant but often inconclusive achievements of the masters, from Faraday to Eddington and Heisenberg. Biology, psychology, and the social sciences are also briefly reviewed, and their respective aims and

accomplishments are set against the ideals of rigor and clarity prevailing in the "exact" sciences. A final chapter of Metaphysical Observations leads the author through much intricate discussion of abstract notions to his own point of view that "the task of philosophy" is "the theoretical comprehension of human experience in its entirety," involving "the differentiation and integration of . . . values in a systematic unity."

It is probable that students familiar with the exhaustive work of Emile Meyerson, E. Cassirer, Norman Campbell, C. I. Lewis, and other theorists of science will not find a great deal that is new in this book. But it was not written for advanced students; indeed, the author, whose own scholarship is much in evidence in the text, footnotes, and bibliography, intends no more than an introduction to a subject the latest contribution to which will be found in the masterly "Reason and Nature" of Professor Morris R. Cohen. As such it performs an admirable liaison service between layman and specialist.

HAROLD WARD

Chatterton

A Life of Thomas Chatterton. By E. H. W. Meyerstein. Charles Scribner's Sons. \$7.50.

EVEN at this date, far removed from the last four decades of the eighteenth century, it is very nearly impossible to view the legend of Thomas Chatterton with a dispassionate eye. The sentimental story of his suicide seemed to become a signal for the display of sensibility and romantic fervor. Here was young David taking his stand against Goliath. In this case the Biblical giant happened to be an effeminate gentleman of letters, a Horace Walpole, but no matter—he was still Goliath, dressed in silks and ribbons and reclining in an armchair at Strawberry Hill.

Out of the veritable mountain of facts concerning the subject of a nine-year study, Mr. Meyerstein clarifies the issue between the young poet and his boyish hoax and the effort on the part of a man of letters to defend his reputation as an antiquarian. In fact, the Walpole-Chatterton controversy becomes the central point of interest in this biography; it is here that Mr. Meyerstein makes his original contribution to the history of English poetry.

The original hoax, backed by two Bristol historians, William Barrett and George Catcott, was immediately placed under suspicion by Walpole and Dr. Johnson. Literary mysteries, however, have a method of self-propagation that carries them far beyond the limits of human reason. It was not until the latter half of the nineteenth century that the question of Chatterton's remarkable vocabulary was definitely settled by the famous philologist W. W. Skeat. Mr. Meyerstein has amplified Skeat's discoveries by a detailed account of the Walpole episode and a careful revaluation of Chatterton's famous "Rowley Cycle" as the work of a highly gifted and original poet.

The story of the Walpole-Chatterton dispute is closely associated with Chatterton's conception of himself as an artist, and is therefore of primary importance. The facts that Mr. Meyerstein presents may be summed up as follows: Chatterton, at the time he appealed to Walpole for criticism and assistance, had fully identified himself with Thomas Rowley, a fifteenth-century character of his own creation. Barrett and Catcott, the Bristol historians, were delighted with Rowley—here at last was a poet of which all Bristol could be proud. To prove him false would leave them barren indeed, and Bristol's annals of antiquity, deprived of their hero, would be decidedly less glorious and imposing. Walpole received Chatterton's manuscript with great enthusiasm, and then suddenly grew cool,

fearful of being made the victim of a hoax. Meanwhile, Chatterton, insulted by Walpole's neglect of the merit contained in the poetry he had sent him for critical examination, saw the frustration of his hopes. He never forgave Walpole and, what is more, disclosed his hatred. Walpole, in self-defense, circulated lies concerning his entire relationship with young Chatterton. It was not until after Chatterton had come to London and died in poverty that Walpole began to see merit in the work that had been offered him by his young enemy. Mr. Meyerstein refuses to sentimentalize over details of the Chatterton suicide. It is quite possible that the motives for Chatterton's suicide may be found in his revolt against himself. The real Thomas Chatterton was Thomas Rowley, not the brilliant hack who made a precarious living by writing political satire. The death of Rowley—murdered by critics such as Walpole and Dr. Johnson—found a logical conclusion in Chatterton's suicide.

Mr. Meyerstein's excellent analysis of Chatterton's poetry is worth the consideration of anyone interested in a definitive study of the romantic tradition in English literature.

HORACE GREGORY

Notes on Fiction

Three Pairs of Silk Stockings. By Panteleimon Romanof. Translated by Leondide Zarine. Edited by Stephen Graham. Charles Scribner's Sons. \$2.50.

"A Novel of the Life of the Educated Class Under the Soviets" is the subtitle of this realistic story by a Communist writer. It contains no propaganda; it is, indeed, brutally frank in its portrayal of the harshness of life in overcrowded and underfed Moscow. It reads like the study of an impartial observer who is neither sympathetic nor hostile toward the people who come under his eye. This is not to imply that the book is a tract. It is an engrossing novel of the naturalistic school; it is most certainly not a Communist fairy tale, a defense or an indictment of anything. Citizen Romanof looks at the *ci-devant* educated classes of the old bourgeoisie as they appear, now that the tables are somewhat turned, robbed of authority, undergoing poverty and hardships, working under commoners who are inferior to them in learning and experience oftentimes, as well as in breeding. He observes the cracking of their morale. The man or woman emerges, bit by bit, from the shell of his former "code of honor," his impregnable faith in the old conventions, ceremonies, habits, convictions. A few remain affected and slightly ridiculous figures in the new Russia. A few turn religious or idealistic. Some, for all their poverty and degradation and hopelessness, maintain fine dignity, an admirable poise, and prove themselves worthy of what was best under the old order. Others, like the protagonist in the story, become toadies to their masters, betray their old comrades, as, bit by bit, their characters prove too weak to stand up under poverty and hardship. This novel about Hyppolit Kisliakof, his wife, his circle of friends, his Communist boss, his trials and moral degradation as he rises to power and influence is, judged as a document alone, a book worthy of attention.

Juan in America. By Eric Linklater. Jonathan Cape and Harrison Smith. \$2.50.

Mr. Linklater's Juan is lineally descended from Byron's, being the great-grandchild, several times removed, of the issue of an amour between that fascinating individual and an English duchess. Juan comes to America to go to a university and study business methods and systems. But he fumbles the ball in an important football game, thus losing his girl, the esteem

of his schoolfellows, and the regard of his professors, who now insist that he do some work. So Juan sets forth on his wanderings through the wilds of America, meeting Chicago gunmen, racketeers who guzzle banana delights in drug-stores, and many other interesting phenomena. He winds up in Hollywood. Mr. Linklater's satire is directed only at the surface absurdities of American life, but it is keen and penetrating in dealing with them. The book is long and for the most part highly entertaining, while some of it is downright hilarious.

Sympathetic to Bare Feet. By Jonathan Leonard. The Viking Press. \$2.50.

This third novel by Jonathan Leonard marks the development of a style and method whose importance may escape immediate attention. The story of the meddling Daniel who loses his finger in the machine he is supposed to have invented and of Edith his granddaughter, who has an affair with a truck driver whom she refuses to marry, contains obscurities of intention and events which might be clarified if Mr. Leonard were content to use an ordinary symbolism; but the value of his novel lies precisely in his refusal to work with conventional symbols or conventional comic tactics. Though the novel may not give instantaneous pleasure to all who read it, a peculiar pleasure is there for the taking.

Occupied Territory. By Alice Ritchie. Harcourt, Brace and Company. \$2.

This quiet story set in the background of the British occupation in the German Rhineland is too slight and ineffectual quite to press its meaning home. But it has subtlety and insight. It does not compare with Isa Glenn's deeply shaded studies of little groups of people caught at odd moments when they are unaware, but it has a quality which brings her novels to mind. Into the variegated group of officers and their wives stationed temporarily in a small German village near Cologne comes the Colonel's daughter, a girl of seventeen straight from a convent school. And when she falls in love, hardly realizing what the malady is, the drama accelerates. There is no love-making. The story is too tenuous to make the reader feel strongly about it, one way or another.

Films

Lectures from the Screen

ASPOKEN narrative illustrated by silent or sound pictures on the screen is a form of the talking picture that is quite distinct from the ordinary dialogue movie. The difference, and it is a very important one, lies in the fact that in the latter case the people and settings shown tell their own story, whereas in the former case the story is told by the lecturer, who arranges his film material with an almost unlimited freedom of treatment. It might have been expected that with this power over his material the movie lecturer would develop a flexible and dramatically effective technique making the utmost use of similarities and contrasts, of variations of tempo, and of the many telling effects obtained from the camera, the film, and the screen. But it is extremely seldom that one encounters such originality of treatment. Not so long ago, at the Astor Theater, on the same program with "A Free Soul," a short sports news-reel showing a group of champion divers distinguished itself by some very ingenious stop-motion effects, the humor and charming narrative informality of which were much appreciated by the audience. "Hell Below Zero," recently shown at the Cameo, is another entertaining as well as in-

structive example of the art of movie lecturing. It is true, photographically the picture does not rise to any great heights, but it is, at least, intelligently put together, so that the lecturer's talk becomes closely interwoven with the images on the screen. The honors of the picture, however, go almost entirely to the lecturer, Mr. Carveth Wells, whose delightful wit and ease of manner enable him to carry and convey his knowledge with captivating charm. For the benefit of those who are interested in such matters, I may mention that the title of the picture is rather misleading. The picture's record of the mysterious Mountains of the Moon in equatorial Africa contains nothing that can justly be described as "hellish," but on the other hand it gives some extraordinary views of the vegetation of the region, which is probably the most fantastic thing seen on the earth; and as an introduction to this Mr. Wells treats us to some "inside information" on the African jungle, which does not appear to exist, and on the ferocious ways of lions, which, as Mr. Wells shows us on the screen, would do anything to run away from you if you would only let them go.

I do not know if the box-office value of "Hell Below Zero" had any relation to its qualities. But I do know that the picture that followed it at the Cameo, called "Mystery of Life," is considered, and probably is, a great money-maker. And yet, aside from its subject, the story of evolution, which has acquired a kind of mystic significance in the eyes of the general public, and aside from the name of Clarence Darrow, who officiates at the ceremony of "explaining" evolution, I have seldom seen a picture so badly made and so dull. The main

trouble with the picture, of course, is that it attempts too much. No intelligent story of evolution can be shown and explained on the screen in a film of ordinary length. Moreover, a subject that requires not only a display of data but a reasoned and telling demonstration can hardly be treated in the haphazard way of the picture in question. It is not enough to throw the facts on the screen. They must be built up into syllogisms. In this case neither Mr. Darrow, slow, ponderous, and primitively theological in his evolutionism, nor his collaborator, Dr. Parshley, who supplies the scientific data, has taken the trouble to tell his story in the clear and concise fashion demanded by the subject. But, then, neither of these two gentlemen can be expected to know much about film making, and the company that made the film apparently never came to their rescue.

ALEXANDER BAKSHY

Drama

THE new "Ziegfeld Follies" (Ziegfeld Theater) are disappointing. Were the former "Follies" really as good as I thought they were, one asks oneself, or is this really one of the poorest of them? The girls are as beautiful as ever; the dancing is extremely smooth and good; Urban has perhaps done better scenery, but this is not bad; the music will pass. . . . Yet with the exception of one or two scenes the revue is almost completely lacking in fresh ideas or humor, and this is surely a serious handicap.

THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York. British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London, W. C. 1, England.

AS WE GO TO PRESS the heads of seven governments are meeting in London—to do what? To save Germany! The very nation that thirteen years ago they were doing their utmost to destroy as Huns, beasts of Berlin, baby-killers, “a people worse than snakes—no, I apologize to the snakes,” as Liberty Loan speakers put it in one of those official addresses sent out by our kindly and gentlemanly Treasury Department for their speakers everywhere to recite. Why is it that the same nations which were then trying to kill Germans are now trying to save them? Because they know that if Germany collapses financially, they will be ruined, too. How amazing it is that these same nations could not see in 1918 that every day they prolonged the war they were but digging their own graves; that every injury to the one country but crippled the other; that the whole world was intertwined and the World War, therefore, the most stupendous of madresses. Now in peace time the effort is to rescue those once vile Boches, lest all perish. But does the world, and especially America, at last see that we are only paying for the war now; that the war is not yet over so far as its economic results are concerned—not by any means? That we shall continue to pay and that we shall eventually lose all that it cost us to aid our Allies? And that we may consider ourselves fortunate then if we still have our capitalist social organization unaltered?

“ONCE UPON A TIME,” the cynical *Menorah* Journal remarks, “a Zionist was a Jew who meant to live in Palestine. . . . Now a Zionist is a man who invests

his money in Palestine and runs home to West End Avenue to wait for his eight-per-cents to start rolling in.” There is a sad grain of truth in the *Menorah's* bitterness. Zionism has become a great business enterprise operating in a hard and practical world, and its profound meaning to the Jewish people is often lost in a cloud of statistics. Hence the growth of the romantic movement known as revisionism, which made the news of the recent world Zionist conference at Basel. Vladimir Jabotinsky, leader of the revisionists, is a sincere and flaming soul who lives in daily communion with a dramatic dream of a Jewish national state—something more than a “national home”—on both sides of the River Jordan in Palestine. The Zionist leaders, he believes, have been too tenderly diplomatic with both British and Arabs. A magnificent and dangerous man, Jabotinsky. For the Jewish national home is today a minority in a little corner of the Arab world, owing its existence to lukewarm British support against the increasingly suspicious Arabs.

AT BASEL the revisionists were an earnest and vocal minority, demanding the removal of the old Zionist leaders and the adoption of planks which would make plain that the Jews wanted Palestine as their own. They succeeded, through various alliances, in ousting Chaim Weizmann, who won the Balfour Declaration from England and has given fifteen years of intense devotion to Zion, as president of the World Zionist Organization, but Dr. Weizmann was replaced by Nahum Sokolov, a Russian who has worked hand in hand with Dr. Weizmann since the early days of the World War. The revisionists affected the content of the resolutions adopted, but they could not turn them into frank declarations of political Zionism. In substance, the effect of the congress is that a loyal pilot has been dropped overboard and his policy faintly indorsed. The crucial MacDonald letter, stating the official position of the British Government, was, after a fight, accepted as a basis for further negotiation. Zionism, obviously, is in a state of slow flux. Some day the Zionists of the world will have to face more clearly than they have yet had the vision and courage to do the fundamental questions: What is Zionism? What does Palestine mean to Jewry? Perhaps before these can be answered, a deeper question still must be faced. What is Judaism?

THE FURTHER DOWNWARD PLUNGE of wheat to new low levels has of course been to a certain extent the result of the financial disorganization in Central Europe. Mr. Hoover's ample acknowledgment in his telegram to Senator Capper, therefore, of the close relation of wheat prices to foreign political and economic factors, is gratifying, particularly in view of his statement a week earlier implying that the decline was the result of the machinations of wicked short sellers. It is peculiarly unfortunate, however, and an unpleasant reminder of his assurances of a year or more ago that prosperity would be back in two months, that Mr. Hoover should have thought it necessary to add that “the major problem in this connection has been solved” by the

recent debts and reparations moratorium. While that moratorium was a necessary and admirable first step, it seems pointlessly fatuous to refer to it as a "solution" just a day or two before a great conference of the heads of governments to meet an economic crisis unparalleled in the history of capitalism.

"SHOCKING TO ONE'S SENSE of justice" is the phrase used by the now extinct Wickersham Commission in describing "the famous Mooney case in California." This was in the course of the commission's report on criminal procedure. For some reason the voluminous findings on the Mooney-Billings case itself have not yet been published. Referring to the case, the present report declares:

... upon appeal to the Supreme Court of the State from the judgment of conviction of murder and an order of the trial court denying motion for a new trial, that court held that a new trial could not be granted upon matter not appearing in the record, even though the new matter consisted of evidence charging perjury on the part of a material witness for the State. . . . The only remedy was the exercise of executive clemency. Such a state of the law is shocking to one's sense of justice.

Shocking, indeed. Except, apparently, to the sense of justice of several governors of California, who have had an opportunity to exercise executive clemency and have refused. Governor Rolph is reported to be at work upon Mooney's application for a pardon. It is inconceivable that he will not be influenced by the record of perjured witnesses, by the appeal of the trial judge and eleven of the jury, by the honest opinion of thousands of persons who believe that Mooney was not proved beyond doubt to be guilty of the crime for which he has already spent fourteen years in prison. The opinion of the Wickersham Commission simply adds to that burden of honest doubt. And the burden rests not on Tom Mooney in the end, but on the courts of California. They, too, need to be free.

THREE HUNDRED JOBLESS MEN marched upon the storekeepers of Henryetta, Oklahoma, the other day, not to beg for food, but to demand it. They went from shop to shop, declaring they would take what they wanted by force if it was not to be had by more peaceful means. Only great tact on the part of one or two leading residents of Henryetta prevented these almost desperate men from resorting to violence to satisfy their hunger. This is but a mild foretaste of what is coming next winter unless the responsible government officials in Washington and elsewhere awaken to the gravity of the situation before them. Starving men, even starving Americans, will take the law into their own hands when the society to which they belong denies them adequate food and shelter. When the hunger marches and subsequent disturbances begin spreading, will the local communities be found ready to cope with the situation? President Hoover believes they will. But last winter, when the problem was not nearly so serious, many cities and towns showed themselves unable to meet the unemployment emergency. Budgets were strained, deficits were incurred, news of disturbances was suppressed, and hundreds of thousands of people barely pulled through the winter without enough food or clothing. Are we to have this picture repeated next winter in increasing measure?

THE COMMUNISTS have called a nation-wide textile strike, presumably in support of their followers in the New England mills who have been out on strike since May. Orders for the general walkout have been issued by the National Textile Workers Union, though no definite date has been set. Meanwhile the Rhode Island and Connecticut mills involved remain closed. After two months of comparative quiet the situation there has suddenly become tense, the Rhode Island militia has been mobilized, State troopers have moved into the mills prepared for a long siege, and the police in at least one town, Pawtucket, have been instructed to use their guns whenever necessary to break up meetings or gatherings of strikers. The American Civil Liberties Union has found that "all the disorder and violence so far reported in this strike, with the exception of slight damage to property from missiles, has been caused by the police." In ordering a nation-wide walkout, the United Front General Strike Committee said that the unions affiliated with the American Federation of Labor would join the Communists. This was promptly denied by the A. F. of L., which makes it doubtful whether the National Textile Workers Union will succeed in its purpose. Nevertheless, the difference in attitude between the radicals and conservatives in the American labor movement is thus once more strikingly revealed. While leaders of the A. F. of L. have been contenting themselves with apathetic requests that wages be kept up, the Communists have been resorting to the strike, the most effective economic weapon labor has at its disposal, and incidentally have not failed to offer relief, inadequate often it is true, along with their labor doctrine; which will doubtless not make the doctrine less acceptable.

WHAT MAY PROVE the most effective plan yet devised to control the traffic in drugs has been adopted by twenty-eight nations in Geneva. Under the new convention for the limitation of drug manufacture the signatory governments agree to stipulate the quantities of habit-forming drugs needed for legitimate purposes in their countries. The production of narcotics in all the manufacturing countries will then be strictly limited to the total of these stipulated amounts. However, the new plan has one obvious weakness. It fails to control the production of raw materials. Such limitation was proposed by the Russian delegation, but rejected by forty-three votes to two. A news dispatch from Istanbul offers some hope that this omission may not prove so costly as now seems probable. Turkey has long been the largest producer of raw narcotics used in the illicit drug trade, and Turkey has likewise for years refused to subscribe to any treaty governing the production of narcotics. Now, however, the Turkish Government has indicated its willingness not only to accept the new convention, but also to sign the 1912 Hague treaty and the 1925 Geneva convention. This would at least put Turkey under moral obligation to stop the production of raw materials that enter into the illegal trade. China likewise may sign the new agreement, but the domestic situation in that country is still far from satisfactory. The Nanking Government announced a fortnight ago that its attempt to regulate opium distribution by public sale has failed. It is now seeking to establish a complete government monopoly, by means of which it hopes gradually to reduce the consumption of opium in the territory under its control.

LEON TROTSKY has now denied what many of his friends believed, and what many enemies of Soviet Russia hoped for. He has not lost his faith in the Union of Socialist Soviet Republics he helped create, and he will not turn his back on it. This he emphasized when interviewed by an Associated Press correspondent at his villa near Istanbul. "If those at Warsaw and Bucharest," he said, "hope the internal difficulties of the Soviet Union can reflect my tendency by representing me as being in the camp of the defeatists of the Soviet Union, they are truly mistaken." He declared his opposition was solely to the methods employed by Stalin, and "does not touch the general questions of socialism." In the moment of danger, he added, the Trotskyists "will fill the most combative positions, as they did during the October upheaval or during the years of the civil war." This should dispose of the rumor peddled through Europe by the interventionists that they could look to Trotsky for help when they launched their much-discussed, but long-delayed, offensive against Russia. At the same time another anti-Russian falsehood was being denounced. The special committee of the Timber Trade Federation of the United Kingdom declared it had found "not a scrap of evidence of forced labor" in the timber industry of northern Russia. This committee has just concluded a thorough and unrestricted inquiry of its own into labor conditions in the timber area. Perhaps the United States Treasury might learn something by following the lead of the British timber men.

A TEMPEST IN A TEAPOT is boiling over the forthcoming Washington memorial pageant at Yorktown. Yorktown, it will be remembered by all good patriots, was the little Virginia town at which Lord Cornwallis, representing his Majesty King George III, surrendered his sword, his army of 7,000 men, and the British hopes in the New World to the upstart American army under General Washington. The truth is that my lord Cornwallis was not present at the surrender and neither was the General. The Earl was "indisposed" and sent a substitute; the General also sent a representative, being disinclined probably to receive the weapon from any but the high command himself. The situation was complicated, for the British, by the presence of French warships in Chesapeake Bay and all sorts of pressing military engagements at home. The utmost good feeling prevailed, and the surrender was followed by a banquet at which the principals and many of their subordinates toasted each other gallantly. Some of these details have evidently been forgotten by the American Department of State. For when protests were made that a scene in the coming pageant depicting the surrender would hurt the feelings of the British, a subordinate official agreed, and it was proposed to substitute a "very beautiful parade" of ladies in colonial costume for the historic scene. This is a matter on which we are glad to say we have no opinion whatever. A dashing picture of officers in British uniforms of the period bowing handsomely to officers in Continental uniforms of the period would be nice; and a very beautiful parade, if the adjective applied to the ladies as well, would be nice, too. But it is comforting to know that when the State Department might be thought to be more or less busy with international affairs of first importance, it has time to keep an eye on momentous questions at home.

Men and Diplomacy

THAT a man can be a human being and a diplomat too, and that a diplomat need not be merely a reporting clerk at the end of a cable or telegraph wire, was clearly demonstrated by Dr. Friedrich Sthamer, whose death is reported from Germany. Here was one who had never been a diplomat or in any way trained for diplomacy, yet he was picked out by his government for the incredibly difficult job of becoming the first German Ambassador to London at the close of the war. His only previous offices were local ones held in his native city of Hamburg, which he successfully served as burgomaster. None the less, he accepted the commission and achieved a most extraordinary success. When he first went to London as chargé d'affaires in 1920, all England was still hating Germany, and Lloyd George's infamous hang-the-Kaiser campaign speeches were ringing in people's ears. But with quiet dignity, simplicity, and directness of manner Dr. Sthamer knew how to find his way to the hearts of the English people with whom he came in contact and to prove to them how misplaced the adjective Hun was in connection with Germans. He became a real friend of the King and Queen, who singled him out for attention because they enjoyed their contact with him and came like everybody else to admire him. For a decade he carried on this work, staying years beyond the retiring age by special request of his own government. Not until he was ill and seventy-three years old was he permitted to leave, and when he went the expressions of regret were widespread.

For Americans it is pleasant to recall that Dr. Sthamer was helped not a little by an extremely tactful wife, whose mother, Mary Codman, was a Bostonian. Both had the charm that comes from perfect manners and good breeding. They were accessible; they were intrenched behind no ceremonial. They never cringed; they did not apologize for their country or its war record, nor did they lick the boots of those with whom they came in contact. It goes without saying that they had unusual human qualities, and this distinguished couple contributed enormously to the disappearance of the war hatred in England in a far shorter time than was deemed possible when Dr. Sthamer arrived.

So we have additional proof that it does not necessarily take special training to make a great diplomat. Training for this career has its value, beyond question, in a complex world such as ours. But what counts after all when one assumes as delicate a position as Dr. Sthamer's or when one takes high office in a government is whether one has inborn wisdom and tact, courage and character. Given those, it is not so difficult for a man to fill any position in which he can make sincerity, honesty, and straightforwardness tell. There was nothing more of the old time diplomat about Dr. Sthamer than there was about James Bryce when he became Ambassador to Washington without any acquaintance with diplomacy. Mr. Bryce's extraordinary success was, like Dr. Sthamer's, due to his modesty, his force of character, and his freedom from anything that might seem like indirection or duplicity, not to mention his general knowledge of the world and especially of the country to which he was assigned. Men of vision and large souls score success wherever they may be placed.

The United States Returns to Europe

SO we are back in Europe taking part in another European crisis. This time the "official observer" role is frankly abandoned. Secretary Stimson and Secretary Mellon are attending the London conference of seven nations called to deal with the German crisis as the official representatives of the American Government and as full-fledged delegates, while General Dawes, who is again inopportunistly absent from his post, is to hurry back as fast as possible. We are quite aware that the Administration has announced that its representatives will not act in questions involving politics—let that dust blind whose eyes it may. For the present, however, it must be plain to everybody that Europe's affairs are ours as well; that if Europe collapses financially, the United States will face the gravest possible emergency. Call it what you will—selfishness, or enlightened self-interest, or idealistic succor of others in distress—we are doing the right and proper thing, though very, very late. The question still is whether the eleventh hour had not passed before Mr. Hoover moved.

We are well aware that in radical circles, especially in the West, there is a widespread belief that Mr. Hoover acted only because the international bankers saw that they were about to lose all their heavy investments in Germany, and that he is merely pulling their chestnuts out of the fire. Whoever may have convinced Mr. Hoover that it was time to act, this is a case where the interests of the bankers, the government, and the people of the United States coincide. We have paid and are paying now a high enough price for the economic crisis, but that would be little compared to the results of a world-wide economic disaster. Any American government would be recreant to its trust if it failed to go to the rescue of Europe. The United States has played a large part in producing the conditions which menace Europe and ourselves, through its scandalous tariffs, and our insistence on our debt settlements while making it just as difficult as possible for our debtors to pay us. We are aware, too, that there will be a great outcry when Congress meets again that the United States has returned to Europe without specific authorization by that body. Let those who feel thus ask themselves whether they favored American intervention in the war in 1917. If they did, their lips are sealed; their protests must be thrown out of court. When this country decided to violate its sound policy of refraining from European entanglements, it courted if it did not insure precisely what is happening. We made an Allied victory possible instead of that peace "without victors or vanquished" for which Mr. Wilson appealed so eloquently on January 22, 1917; we prolonged the war and ladled our money out to our Allies. The events of today are as clearly the consequences of that fatal decision as anything can be. Nor is the extent of the price that we must yet pay within the vision of any living man.

The Nation can today only applaud the decision of the President to cast off subterfuge. It is especially gratifying that the conference opens with Mr. Hoover's plan for aiding Germany by the renewal of short-term credit. Our participation does not mean that we shall enter the League of Nations,

or undertake any alliances. It does mean that, seeing the beginning of a conflagration, we propose to lend a hand to help put it out before it singes—or burns—our own edifice. For all the pleasant words in the official statement of the results of the Brüning-Laval conference in Paris, the fact remains that little or nothing seems to have been actually accomplished. It was a *succès d'esprit*—nothing else. The Germans came; they were handsomely received; the ice was broken; personal contacts were established and a clear and cordial understanding was arrived at. That is all to the good. But the French have officially declared that "under the reserve of certain financial guaranties and measures of political appeasement the French Government would be ready to discuss later the terms of financial cooperation on a basis of international collaboration"—which means that, aside from the enormous benefit of a German Chancellor's being heard in Paris, the result of the conference is practically nil. This communiqué is, moreover, in most striking contrast with an interview given to the United Press by a spokesman of Premier Laval on July 17, when he stated that France was "not a Shylock" and had no intention of exacting any political terms of Germany. We still cannot believe that any German Government can meet the demands of "political appeasement" asked by the French and remain in office in Berlin.

Hence the gravity of the latest meeting in London. No mere face-saving compromises will suffice. As we write, the news of financial conditions in Hungary and Rumania is worse and not better. The contagion is spreading as did the contagion of war in August, 1914. If the London conference provides only for support of the mark it will merely have supplied the most temporary relief. It is a thoroughgoing sanitation of Germany which is required, and after it, as rapidly as possible, relief measures for other states. Saving the mark will not restore the flow of trade or even the necessary confidence in the stability of the European situation. It is therefore greatly to be hoped that the American and English representatives will let it be known as clearly as possible that they are not in favor of Germany's signing away her sovereignty under any circumstances, but least of all in return for a temporary credit for the support of the mark. The German bankers are right in declaring that only a long-term credit can replenish the Reichsbank's reserve permanently, make possible adequate currency circulation, and prevent the further calling of bank credits to business, which would inevitably bring further insolvencies.

Meanwhile, the Department of Commerce has made public a report calling attention to the fact that of twenty-three countries in Europe sixteen are reporting deficits due in large measure to the economic crisis. Could anything illustrate more clearly the sickness of the body economic everywhere, or the interest that governments all over the globe have in seeing something done at London to stem the drift toward international bankruptcy and repudiation? Only the statesmen who were in office on August 1, 1914, have had a greater responsibility to face than that which rests upon the men who have assembled in London.

The Slump on the Ocean

THE trouble in which the United States Lines find themselves is so grave that the announcement of the taking over of this corporation by the Roosevelt-International Mercantile Marine Company is daily expected. In the international conferences here and abroad for a drastic reduction of the Atlantic fares, the representatives of the United States Lines have been most eager for lower rates, after stating frankly that they expected this year to earn only a fraction of what they made in 1930. Hence their efforts to turn back the *Leviathan* and other ships to the United States Shipping Board, from which the company contracted to purchase them. Hence their abandonment of the foolish plan to build two monster liners to keep up a weekly fast service in competition with the new German liners and the record-breaking Cunarder now under construction, and the slowing up in construction of the two 30,000-ton ships to which the company was committed before the economic collapse came. The stock of the United States Lines has now fallen almost to nothing, which is an especial hardship upon the many employees who put their savings into the enterprise.

Whether the new combination will meet with greater success or whether the government will not finally have to take back its vessels, time will show. In P. A. S. Franklin, the Roosevelt-I. M. M. Company has the most experienced of American shipping managers, who has won the friendship and support of many of our foremost financiers. But even the most experienced managers are at a loss at the present time, for the world crisis is almost at its worst on the ocean. Thus, the chairman of the General Ship Owners' Society of London has just reported that more than 2,250,000 tons of British shipping are idle, and 45,000 seamen deprived of their means of livelihood. In the whole world there are eight and one-half million gross tons of shipping now laid up for lack of cargoes. Conditions in the North Atlantic trade are worse than they have been in the memory of any living man—not even the German submarine created greater havoc. Never before have the leading steamship companies laid off some of their largest and fastest ships in June and July—the best earning months for east-bound travel. It has been publicly stated that the loss in traffic is at the rate of 6,000 passengers a week—127,000 in the first five months of the year. Only two ships are earning money, the crack North German Lloyd liners, *Europa* and *Bremen*, the latter being the only vessel to leave New York in 1931 with cabins entirely full—this on her voyage beginning July 17. So great is the attraction of these vessels, which cut one day from the voyage, that the North German Lloyd was the only line in the world to report a net profit in earnings in 1930—one of 10 per cent. These ships have a capacity of 2,200 passengers in all classes; their average for 1930 was 1,447; the average of the three leading Cunarders was 700.

But it is not only the economic crisis which Americans must consider in studying their merchant-marine problems. The truth is that not a single transoceanic American line could stand on its own feet even before the slump. Nothing but the huge government subventions in the form of building

loans and mail contracts have made possible the establishment of the lines which have come into being since the Jones-White legislation of 1928. From New York alone today forty-two lines flying the American flag are operating seventy-five services—eight to Europe, ten to South America, seventeen to the Caribbean and Central America, three to the Far East, three to Africa, and one to Australia—two of these services reaching around the world. The duplication in existence is best illustrated by the fifteen American-flag lines operating to Havana, the twelve lines to Honolulu and Manila, and the ten which send ships to Hongkong and Shanghai. It goes without saying that most of these are freight services; it is one of the remarkable developments of the post-war shipping period that the old tramp steamers, wandering from port to port with utter irregularity, as business dictated, have yielded to freight lines with regular sailings. More than that, many of these new freighters are fitted with most acceptable cabin accommodations for those travelers for whom speed is no object. But New York is not the only American port with transoceanic lines. Philadelphia has twenty-six, Baltimore twenty-five, including one direct to Hamburg inaugurated on July 17, Norfolk eighteen, Boston seventeen, Newport News twelve, Savannah nine, Portland, Maine, and Charleston, South Carolina, eight each, Wilmington, North Carolina, seven, in addition to the other services. No less than eighteen Gulf ports are also operating American-flag ships, of which New Orleans has sixteen lines, Mobile fourteen, and even Tampa, Florida, twelve. This is certainly an amazing expansion.

The question of its cost is, however, an extremely important one. The Treasury is now paying out \$21,000,000 a year, almost a pure gift to the owners of these lines, save that a certain amount of mail is carried by these ships at a far higher rate than was ever paid for mail in all the world before. Within three years this sum will rise to \$30,000,000, just at the moment when Mr. Hoover is struggling to hold down the expenses of the country. For years the shipping interests sought a direct subsidy. This, Congress time after time refused to vote, but the after-the-war demand for an American merchant marine led to the institution of this mail subsidy—it is not a mail payment for service rendered. More than that, the administration of this expenditure has been such that we look for a sensational exposure whenever Congress gets round to an investigation. Certainly it will never approve the policy of the government in making these mail payments to the purchasers of old ships at as low as \$7 a ton, when it was the deliberate intention of the framers of the law to award these contracts only to new vessels to cost about \$150 a ton. We believe that mail ships should be paid a reasonable price for actual service rendered, but no subventions. We have never believed in government support of an industry which could not justify itself financially, and we do not believe that the arguments that such a fleet is needed for national defense, or because of national pride, are worth the paper they are written on. Germany's fleet has been rebuilt without subsidy of any kind. If we cannot do as well, we should let others carry our trade.

President Hoover's Record

VI. Mr. Hoover's "Noble Experiment"

By PETER H. ODEGARD

IN his speech of acceptance on August 11, 1928, Mr. Hoover referred to the Eighteenth Amendment as "a great social and economic experiment, noble in motive and far-reaching in purpose." He did not suggest that he thought the experiment wise or successful. On the contrary he declared: "Common sense compels us to realize that grave abuses have occurred—abuses which must be remedied [and] only an organized, searching investigation of fact and cause can . . . determine the wise method of correcting them." Thus the candidate comforted the drys, reassured the wets, and committed himself to nothing.

The Coolidge administration of prohibition had been bitterly criticized by wets and drys alike. Both expected more action and less talk from Mr. Hoover. The drys claimed him as their man from the start and hailed his election as the beginning of a new era in prohibition enforcement.

In his inaugural address he referred to "disregard and disobedience of law" as the "most malign" of all the dangers confronting the country, and indicated his intention to appoint a national commission to study the problem and propose remedies. The commission was not to confine itself to prohibition, but was to study "the whole structure of our federal system of jurisprudence." But it was upon prohibition that public attention was focused.

On May 20, 1929, Mr. Hoover announced the appointment of his law-enforcement commission with George W. Wickersham as chairman. It is significant that in the President's first address to the commission he made no direct reference to prohibition. That prohibition was uppermost in the mind of Mr. Wickersham, however, is seen in a letter which he addressed to Governor Roosevelt of New York in July. After calling attention to the concurrent-power provision of the Eighteenth Amendment, Mr. Wickersham said:

If the national government were to attend to preventing importation, manufacture, and shipment in interstate commerce of intoxicants, the State undertaking internal police regulation to prevent sale, saloons, speakeasies, and so forth, the national and State laws might be modified so as to become reasonably enforceable.

This very sensible proposal was met with a chorus of protests from the drys. Bishop Cannon denounced it as "defeatism," Senator Caraway demanded Wickersham's resignation, and Mr. Clinton Howard of the National United Committee for Law Enforcement objected to the Constitution being "Wickershammed into a squatter-sovereignty hodge-podge." Mr. Hoover gave no sign of approval or disapproval of Mr. Wickersham's suggestion. He appeared satisfied that, the commission having been set to work, the issue had been successfully sidetracked for the time.

In the meantime, the President recommended to Congress

certain changes in the law relating to enforcement. There was little that was new in the Hoover legislative program. His major recommendations included transfer of the Prohibition Bureau from the Treasury to the Department of Justice, provision for the relief of congestion in the courts by simplifying the procedure for dealing with petty prosecutions, recodification of the prohibition laws, the organization of an effective border patrol, a new prohibition law for the District of Columbia, expansion of federal prisons, and a plan for the use of State officers in federal law enforcement.

The Williamson act, transferring the Prohibition Bureau to the Department of Justice, was approved by the President May 28, 1930. Several prison-reform measures were enacted and a number of new federal judgeships created. Some two and a half millions were added to the appropriations for enforcement to enable the employment of five hundred additional agents. Bills to carry out Mr. Hoover's other recommendations, in spite of considerable pressure from the White House, were stillborn.

Senator Howell of Nebraska, on September 21, 1929, delivered a biting attack upon the President for his failure to enforce prohibition in Washington. Mr. Hoover immediately demanded that Howell furnish him with evidence concerning violations. The Nebraskan lamely replied that he had no evidence and in the end became sponsor for an Administration measure providing a prohibition-enforcement code for the District of Columbia. The debate on this bill dealt chiefly with its radical search-and-seizure clause, suggested by the Prohibition Bureau, under which a police magistrate might issue a search warrant upon mere suspicion that intoxicants were illegally made or stored in a home. The bill came in for a vigorous drubbing by both wets and drys. It had been placed on the preferential calendar and everyone expected immediate and favorable action. But as Senator Glass expressed it, the Senate declined "to exasperate people further with prohibition by proceeding with a farce like this bill."

Overshadowing all other aspects of the Hoover prohibition policy, was the final report of the Wickersham Commission submitted January 20, 1931. The country had assumed that this report would be made the basis for definite recommendations looking toward a sane solution of this question. Long before the report was made public, rumor had it that a fundamental change in the existing law would be proposed and at least two commissioners believed that such a recommendation had been made. Commissioner William Grubb in his individual statement said: "I join in the findings of fact and all the ultimate conclusions in the general report . . . except that recommending that the amendment be revised immediately without awaiting a further trial." A similar statement was made by Paul J. McCormick. As a matter of fact, the general report made no such recommendation, although seven of the eleven commissioners favored immediate repeal or revision. What the

* The sixth of a series of articles on President Hoover's Record. The seventh, on Secretary Hoover's Power Record, by Amos Pinchot, will appear in our next issue.—EDITOR THE NATION.

report said was that there should be a further trial, "and if after such trial effective enforcement is not secured, there should be a revision of the amendment." Aside from this, the general report contained nothing new. Every other recommendation was ancient history.

The bulk of the 286 pages of the commission's report is a devastating picture of the breakdown of enforcement. The drys were comforted by the conclusions that there should be no repeal, no modification to permit wines and beer, no return of the saloon, and no engagement in the liquor business by the federal or State government. Mr. Hoover emphasized this aspect of the report when he said: "The commission, by a large majority, does not favor the repeal of the Eighteenth Amendment. . . . I am in accord with this view." All this in the teeth of the fact that a majority were individually for immediate repeal or revision. It seems, as Senator Norris commented, that the commission "was trying to prepare something which everybody could sign and nobody agree to."

In presenting the report to Congress the President said:

I must not be understood as recommending the commission's proposed revision of the Eighteenth Amendment, which is suggested by them for possible consideration at some future time if continued effort at enforcement should not prove successful. My own duty and that of all executive officials is clear—to enforce the law with all the means at our disposal, without equivocation or reservation.

From Mr. Hoover's point of view the work of the commission was pretty much wasted effort, since it revealed nothing new and suggested no new remedies except those which he repudiated. It is not surprising that in view of the President's stand and the apparent misunderstanding within the commission itself many persons should believe that the general report and conclusions had been issued under pressure from the White House. This has of course been denied.

In his address to the Associated Press on April 22, 1929, Mr. Hoover outlined his enforcement policy. There were to be no "dramatic displays of violent attacks in order to make headlines," but a systematic strengthening of law-enforcement agencies "week by week, month by month, year by year." Federal agents were not to enforce the law by violating it themselves. There was to be a more systematic effort to weed out incompetent and dishonest agents and "rigid scrutiny of the records and *attitudes* of all persons suggested for appointment."

On the administrative side Mr. Hoover has had a considerable measure of success. The transfer of the Prohibition Bureau to the Department of Justice brings together the work of detection and prosecution and makes possible a concentration of power and responsibility. The President has placed able and trustworthy men in charge of enforcement. Attorney General Mitchell, who has the confidence of the drys as Mr. Mellon did not, supports Mr. Hoover's view that only conscientious prohibitionists should be appointed to the service. He frowns on illegal methods and has declared that such practices as indiscriminate wire-tapping, illegal searches and seizures, violence and bloodshed are not to be tolerated. Colonel Amos Woodcock, Director of Prohibition, has been hailed as "the man of the hour in the prohibition-enforcement field." A recent letter from an outstanding Anti-Saloon League leader says:

Unquestionably Woodcock is the best director we have had. The newspapermen in Washington who have discerned the shallowness of brains and penetrated the sham of Lowman tell me that Woodcock stands *à*ce high. There doesn't seem to be any dissenting voice on this regardless of whether the newspaperman is wet or dry.

Colonel Woodcock has announced that he will pay no attention to the petty household offender.

Our objective [he says] is against the sale, the commercial manufacture, and the commercial transportation of intoxicating liquor. I will not have our agencies following the course of least resistance and wasting their time upon pitiful, picayunish, non-commercial cases.

With the additional 500 agents recently provided he now has a force of some 3,200, but he insists he is more interested in the quality than in the quantity of enforcement officers. By careful selection, the rigid application of the merit system, and the inauguration of a system of efficiency ratings upon which to base promotions he hopes to reward the competent, eliminate the incompetent, and develop a better morale. He prefers young men. Each new agent is put through a period of intensive schooling during which emphasis is laid on the law governing search and seizure, injunction proceedings, and so forth. Agents are instructed that since the search-and-seizure provisions of most State laws are much more lax than those of the federal law, "with State and federal officers cooperating sincerely, more beneficial results will be obtained by reason of the wide latitude of authority given to State officers."

These instructions come with poor grace from an administration which scorns illegal methods. For as Representative Linthicum of Maryland recently declared:

The agents of the federal Prohibition Enforcement Bureau are encouraged and instigated to cooperate with State and local officers to violate the plain and emphatic provisions of the federal Constitution and statutes. They are told to do things in conjunction with State and local officers which, if they did them as federal officials, would bring them within the range of federal statutes and subject them to severe punishment.

Obviously, the Prohibition Bureau is attempting to deal with the weakest link in the chain of enforcement—State and local cooperation. Mr. Hoover has repeatedly emphasized this aspect of the problem. The Wickersham report declared that "without genuine cooperation by the State police authorities the federal forces are wholly inadequate to enforce the law against speakeasies, bootleggers, and small distillers." Not much genuine cooperation can be hoped for in those States where local enforcement laws have been repealed and wet sentiment runs high. Only recently Attorney General Warner of Massachusetts instructed the State police that since the repeal of the "Baby" Volstead Act they no longer have any authority to enforce the prohibition laws.

In view of this situation a new theory—the Hoover-Mitchell-Woodcock theory—seems to be emerging—namely, that of leaving all but interstate combinations and commercial manufacture and transportation to the State and local officers. "As things are at present," says the Wickersham report, "there is virtual local option."

The President has repeatedly emphasized the obligation of the private citizen to obey the law and assist in its en-

forcement. Thus in his first message to Congress he said:

Law cannot rise above its source in good citizenship—in what right-minded men most earnestly believe and desire. If the law is upheld only by government officials, then all law is at an end. Our laws are made by the people themselves; theirs is the right to work for their repeal; but until repealed it is an equal duty to observe them and demand their enforcement.

In an effort to mobilize opinion in support of the law, "Three Gun" (Harold D.) Wilson, deputy prohibition administrator for Delaware, has organized vigilance committees of citizens to cooperate in promoting law observance and enforcement. These tactics are reminiscent of William H. Anderson's Allied Citizens of America, of painful memory. Mr. Wilson presumably has the support of both Colonel Woodcock and the President in this new experiment. If successful in Delaware it may result in a nation-wide "co-operative and coeducational program."

Mr. G. Aaron Youngquist, Mr. Hoover's assistant attorney general in charge of prohibition, is convinced that enforcement is becoming more effective. Cases prepared by enforcement officers have stood up better, there being 1,177 fewer cases dismissed in 1930 than in 1929. It is significant, however, that in the Southern District of New York 90 per cent of the cases brought before United States commissioners are thrown out, according to a recent statement made by Andrew McCampbell, administrator for this area. Jail and prison sentences were imposed in 27,709 cases in 1930, an increase of 5,107 over 1929. Last year 56,992 cases were instituted and 52,437 were terminated as follows: dismissed, quashed, or discontinued 12.7 per cent; pleas of guilty 76.7 per cent; trials by jury 10.6 per cent. Apparently "bargain day" continues as a feature of prohibition enforcement.

Dr. James Doran has been continued in charge of the division of industrial alcohol in the Treasury Department. According to his report for 1930 illegal diversion of industrial alcohol "is not one-fourth that of three years ago . . . the independent denaturing plant has been practically put out of business, hundreds of permits have been revoked, very few new ones have been issued, and hundreds of formulae have been strengthened." It seems well established that industrial alcohol as a source for liquor has been substantially reduced and now constitutes a relatively minor problem. The amount illegally diverted last year was estimated at only 9,000,000 gallons. The bootleggers seem to have turned to the use of corn-sugar production, which has increased from 150,000,000 pounds in 1921 to 960,000,000 pounds in 1930.

In spite of improved administration the general situation has not materially changed. Federal courts and prisons are still crowded. This congestion is bound to increase as more States move into the wet column and repeal their local enforcement acts, thus closing the State courts to prohibition cases. Notwithstanding instructions to agents to be more cautious in the use of firearms, the press continues to report killings by prohibition agents. Since 1920 a total of 227 persons have been killed, of whom 69 were agents and 158 civilians. Corruption is general, and although political favoritism has declined, it still constitutes a major obstacle to effective enforcement. Commissioner Kenyon in his separate report declared that "even after prohibition agents were placed under Civil Service, political interference per-

sisted [and] some of the worst men had the strongest political backing." Political influence has been exerted to secure withdrawal permits and to provide protection for bootlegging syndicates. On this topic the general report of the Wickersham Commission said: "Political interference has decreased, but as our institutions are organized and conducted, it will always be a menace to effectual enforcement."

The President, as leader of his party and head of the national administration, is in a strategic position, should he care to do so, to compel politicians to keep hands off the enforcement personnel and procedure. If it became known that Presidential patronage would be distributed to local leaders who cooperated in the enforcement program and to no others, one might reasonably expect a decided change in the present situation. Unfortunately, Mr. Hoover either does not dare or does not care to take so decided a stand. He is content with a policy which gives him the support of the drys without sacrificing the support of Republican politicians to whom prohibition is a new pork barrel second only to the tariff. The situation is not materially different from that described by Mr. Pinchot when he said: "Under the Coolidge Administration there has been dry talk enough to keep the drys contented—most of them—but not dry action enough to keep the wets from getting all the drink they wanted." The *California Liberator*, organ of the Anti-Saloon League in Mr. Hoover's own State, calls loudly for action. "Teddy's Big Stick and a few cracked [political] skulls would do a lot of good."

Whether for good or ill Mr. Hoover has become the Melchizedek of the drys. Already Senators Capper of Kansas and Dickinson of Iowa have proclaimed him as the drys' candidate for 1932. Similar statements have been issued by powerful dry organizations. It is going to be more difficult to straddle the issue in 1932 than ever before. In spite of the issues which have emerged incident to the depression, in spite of the insistence by party leaders that economic issues come first, prohibition will not down. Mr. Raskob and other Democratic leaders are obviously endeavoring to reconcile the South to a wet candidate. Powerful leaders in the Republican Party are demanding a wet plank in the 1932 platform. Eight States with over a quarter of the population have officially repudiated prohibition. Straw votes conducted by the *Literary Digest* and the American Bar Association reveal an overwhelming preponderance of wet sentiment. The Republicans of New York have come out openly for repeal. The Republican convention in New Jersey which nominated Dwight Morrow indorsed his demand for repeal by a vote of ninety-five to thirteen. Republican Party platforms in seven States and Democratic platforms in fourteen States in 1930 declared for modification or repeal. A recent confidential poll of 200 members of the new Senate and House reveals two-thirds of them in favor of modification or repeal. A dry Republican running on a dry platform may have a difficult time of it in New York, Illinois, New Jersey, Wisconsin, Rhode Island, and Massachusetts.

The wets in both parties seem to have the party leaders "on the spot." Mr. Hoover may come to feel before the campaign of 1932 gets under way that in his morganatic marriage with the drys he has taken a bear by the tail. It is politically dangerous to hang on; it would be fatal to release his hold.

Why Must the Miners Starve?

By MAURITZ A. HALLGREN

Pittsburgh, July 15

PITTSBURGH agrees with Chairman John Barton Payne of the American Red Cross. In explaining that his organization could not send food or clothing to the striking miners he said: "The coal strike was the result of an economic situation prevalent in that industry for the last ten years and may continue indefinitely." That is precisely how the residents of the Steel City feel. They have plugged their ears to shut out the tales of woe that have come pouring in on them from the coal fields during the last decade. They will not as much as discuss the suffering which today is greater than it ever has been. The pulpits of the town are silent; its civic leaders are busying themselves with other matters; the newspapers are alive to the situation only when blood is shed or other violence done. In short, this city, which has lived in large measure off the bituminous industry, does not seem to care, and its apathetic attitude serves to prevent the distressing news from the mining towns from reaching the world outside.

Within a few score miles of Pittsburgh a hundred thousand families are going down under the relentless pressure of the economic situation which Judge Payne believes "may continue indefinitely." Some of the helpless human beings involved are actually dying today. More will probably die tomorrow. By next winter—unless some miracle intervenes—the toll of starvation and disease may be greater than any yet recorded on the pages of American industrial history. This is not my belief alone. It is also held by a physician living in one of the coal towns, who is occasionally employed to handle company cases, and by the president of a mining company operating in another section, and by dozens of social workers and investigators who lately have visited the coal fields. The physician frankly confessed that a number of children and young people in his community were literally dying from hunger before his eyes, and he added that his neighborhood was by no means exceptional in this respect. The coal-company president said briefly: "I am sorry that I must admit it, but the children are starving in our coal district." On the same day I saw in a half-dozen other communities adults who had not had more than a chunk of bread or two to eat in a week, and young children who had not tasted milk or anything other than dry bread and canned vegetables for a fortnight or longer. Some of the men in these villages were on strike; others were working; but so low are the wages paid in western Pennsylvania and eastern Ohio that even the latter were not getting enough to eat.

Together with Colston E. Warne and William L. Nunn, two of the foremost students of the coal problem in this country, I have just visited the mining sections in the Pittsburgh area. After our tour Professor Warne said: "Though for ten years I have been in close touch with conditions in the bituminous coal fields, I confess I was unprepared for the shock I received upon returning to western Pennsylvania after a year's absence." At Cedar Grove near Avella, for example, we found two to three hundred sorry-looking

men, women, and children living in barracks that had been erected during the last strike. The occupants had been evicted from company-owned homes. They had crowded themselves into the one-room quarters of these weather-beaten, wind-shaken wooden shacks. In one of these rooms, which measured no more than twelve by eighteen feet, a family of three adults and nine children was living. Occasionally, by sending committees out on begging expeditions, the occupants of the barracks managed to scrape together enough food at least to help the women and children. For shelter they had merely walls of wide boarding generously perforated with gaping holes, and leaky roofs overhead; and of medical attention they had none whatever, although there were several cases of illness in the camp. Not a single doctor in the neighborhood would come to them when called, all of the doctors being employed by the coal companies, or living in fear of the companies. Once or twice an independent physician did respond to repeated calls, but his fee was three times the usual rate, and more than the strikers could pay.

Worse yet was the predicament of the two hundred white and colored folk living in the company "patch" of the Seldom Seen mine. This village is buried in the shade of a mountain several miles from the nearest paved road; it lies in its unseen hollow neglected by civilization and human sympathy alike. It was here that the strike started, spontaneously, and without urging from Communists or union organizers. Today the residents of Seldom Seen are existing wholly by their own efforts. They raise a few vegetables, and for the rest dispatch delegations to the nearby communities, themselves in want, to beg for food. The O'Briens, spokesmen for the people in this "patch," had not had bread for several days when we called on them, and only by the strictest economy had they succeeded in doling out the meager and inconstant milk supply so that the younger children might have fresh milk at least once a week. Here, too, as at Cedar Grove and elsewhere, medical attention was entirely lacking and the camp's supply of medicine was depleted. The rickety, dark, foul-smelling huts these people call home added the final touch to their almost indescribable misery.

Again, in the Castle Shannon region on the outskirts of Pittsburgh, in the vicinity of Buffalo farther south, down through Washington County, on the West Virginia border, along the Ohio line, and in the neighborhood of Export toward the east, virtually the same conditions were observed. Here a community was getting some relief; there the food had been cut off and the miners' families were subsisting on weeds and on hard, blackened crusts from the bread boxes of more fortunate townspeople. In some of the villages are children who have never known the taste of cow's milk, and in others there are whole families whose diet consists solely of an occasional ration of dried beans and coarse bread. Nowhere did we find enough of anything to go around. Even the miners who have remained at work complained of the food shortage. Hundreds of them, feeling that they "might as well starve up here as down in the mines," have

quit the pits voluntarily and not under orders from the strike leaders.

But if these men do not work they lose their homes, which almost without exception are company-owned. Evictions are piling up daily. In the first few weeks of the strike at least a thousand families were dispossessed. How many have since then had their household belongings dumped outside the company "patch" by mine guards or deputy sheriffs can only be guessed. In many instances the miners have refused to move, though eviction notices have been served on them. At the moment some of the companies are hesitating to go farther than to have these notices served, probably because they do not dare to stir up the undertone of rebellion that is noticeable throughout the coal fields. The Communists directing the strike are to all appearances making deep inroads among the underfed miners. Meanwhile the evicted families are finding shelter where they can; fifty or more of them have found room at the Cedar Grove barracks, and many more have appeared there only to be turned away for lack of accommodations. Friendly farmers have put up some of these families in their barns and other buildings; on the Canonsburg road I discovered three families who had taken refuge in a garret over a store run by a sympathetic American turned Communist.

No independent relief whatever is entering the Pittsburgh strike area. The churches and charity organizations in the city are not concerning themselves with the plight of the miners. Only three groups are engaged in the distribution of food and clothing, and all three of them allow political considerations to govern the distribution. Although the Socialists are not at all active in the sense that they might be using the suffering in the coal fields to build up support for their movement, they are nevertheless dispensing relief with the Socialist cause pretty definitely in mind. They are at great pains to see that only present and former members of the party (many of the latter of whom have gone over to the Communists) benefit by the relief they dispense. The United Mine Workers of America are likewise engaged; they remember only those miners who remain faithful to the U. M. W. A. By far the largest amount of relief work is being undertaken by the Pennsylvania-Ohio Striking Miners' Relief Committee, which is affiliated with the National Miners' Union. The committee has organized foraging expeditions (called "Unemployed Councils") in those districts where the strike has been most effective; these expeditions scour the countryside, making door-to-door canvasses for scraps of bread, discarded meat, and other edibles. But in the critical sections, where mines are still operating or the United Mine Workers are still strong, the National Miners' Union has set up soup kitchens and bread lines. This is an essential part of their strike strategy; the Communist leaders use free soup, bread, and beans to break down the opposition of the men who have thus far refused to join the strike, and to strengthen their own lines. In the relief station at Mollenauer hung a huge, hand-drawn placard reading: "Every man, woman, and child must be in Number 8 picket line, or no relief. All relief will be stopped if you are not on the picket line Monday morning."

Such tactics may be open to severe criticism, but it must be remembered that the National Miners' Union is not a charitable organization. It is in the field for the sole purpose of winning the coal strike, and to this end is using

whatever relief it can command. Money contributions are coming in primarily from New York City, but foodstuffs are also being contributed by labor unions, some of them affiliated with the A. F. of L., located in various Eastern cities and towns. Most of this food is of solid and nutritious quality, but sadly lacking in variety. At Mollenauer, for example, each registered family was allotted two loaves of bread, a few pounds of potatoes, and a pound of dried beans. Meat was not to be had in the relief station, although in the basement below a stew kettle was kept constantly boiling and hot stew given out to all persons recognized by the man in charge. The mess in the soup kettle was not very savory, but it looked more appetizing than the soup handed out in Chicago and New York bread lines I have seen.

Feeble as are these efforts to satisfy the hunger of thousands of miners' families, the Communists are not being permitted to do even this much without encountering bitter opposition. Their followers are forced daily to face a silent reign of terror. Strikers are shot at from ambush along lonely roads; so frequently do these attacks take place that they no longer draw forth any comment. In the picket lines the strikers must walk meekly and silently if they do not want the hickory club of a deputy sheriff brought down on their heads. (A goodly number of the notorious Coal and Iron Police have lately been rehired as deputy sheriffs in western Pennsylvania.) But the most intense opposition comes from the newspapers of Pittsburgh, particularly from the *Press*, one of the liberal Scripps-Howard chain. Editorially and in its news columns the *Press*, incredible as it may seem, has been supporting the United Mine Workers, although the influence of that organization is rapidly disappearing in the bituminous fields, and has been just as vigorously attacking the National Miners' Union, presumably because of its Communist leadership. It rarely mentions the N. M. U. without referring to its Communist complexion, and it has gone so far as to recommend the use of tear-gas bombs to break up the union's picket lines, although picketing is legal in the State! It is perhaps unfortunate that all three of the Pittsburgh newspapers should belong to national chains; otherwise community spirit might have led these papers to take a more active interest in the predicament of the miners. As it is, they ignore the dreadful suffering of which some of their reporters could give them most accurate and truthful eyewitness accounts.

Out in the field, however, the strikers continue to absorb the teaching of the Communists despite the newspaper opposition. The miners are slowly being convinced that only radical measures can save them. The Communists may be ousted—there is already evidence that federal agents are quietly at work in the coal towns—and the strike may be defeated, but there is not the slightest hope that the conditions which brought on the strike will then have been eliminated or rectified. It is these conditions, interpreted in simple terms by the Communist organizers to be found in every company "patch," that are responsible for the spread of radicalism. "Sure," said a miner's wife, "I'm a Bolshevik, and so's my man and my four kids. What of it? You'd be a Bolshevik, too, if you didn't have enough to eat." Meanwhile Pittsburgh sits silently by, denouncing the Communists—and withholding relief. It believes rather innocently with Judge Payne that the situation "may continue indefinitely."

Geneva Must Bring Disarmament

By VISCOUNT CECIL

ONE morning next September the delegates of the governments to the Twelfth Assembly of the League of Nations at Geneva will find in the official *Journal* of the Assembly a statement which I trust they will read with care. The statement to which I refer is the common policy upon disarmament adopted by the International Federation of League of Nations Societies at their congress at Budapest; and it is a very important indication of the direction in which public opinion on this subject is moving.

When I say public opinion, I am, of course, fully aware of the fact that in many countries the League of Nations societies have not the large number of adherents which they have, for instance, in my own country, or in Japan, or in Belgium. But the delegates to the federation's recent meetings on the subject were, generally speaking, men of weight in their countries who represented the general tenor of moderate opinion therein. I have only to mention a few of those with whom I collaborated at Paris in the preparation of the federation's disarmament statement to illustrate this fact. There was our *rapporteur*, M. Henri Rollin, the legal adviser of the Belgian Foreign Office and one of the most brilliant exponents of League principles in his country; Baron von Rheinbaben, who has often represented Germany at Geneva; Frenchmen such as M. Pierre Cot and M. René Cassin, the latter a leader of a great organization of former combatants; M. Jean Hennessy, a late Ambassador and a Minister of France; M. Arthur Fontaine, French representative on the B. I. T.; Professor Stronski of Poland, and several others. When our statement was discussed at Budapest it also received the support of that great patriot and good European, Count Apponyi, and of his Hungarian colleagues, in terms to which I shall refer in a moment. In short, it may be described as the highest common measure of agreement between those who, however conscious of their national aspirations and difficulties, are united in their conviction that if peace is not to be gravely jeopardized, the 1932 conference must make real progress toward disarmament.

What then are the proposals of this statement? In the first place, we say that the conference must culminate in a definite disarmament treaty, the first, as it must be, of a series of such treaties. In support of this we give several obvious and imperative reasons: "the definite unconditional pledge given by the members of the League of Nations under Article 8 of the Covenant"; the formal promise which M. Clemenceau gave on the Allies' behalf at Versailles "to the states disarmed under the treaties that the exceptional regime applied to them is only a stepping-stone to a general system of universal limitation and reduction"; the evidence of so many great statesmen, economists, jurists, and historians that the "mad race in armaments" has led and must lead to war; the disastrous effect that the failure of the conference would have.

With these obligations and necessities in mind we formulated a definite proposal which has begun to take shape in the ranks of the disarmament movement both in Europe and America. Here it is:

The situation is such as to justify even now a considerable reduction of armaments, and, apart from the reduction of personnel and material which should be effected, the federation esteems that, provided suitable proportions are laid down for the different states under the conditions mentioned hereunder, the conference should achieve *an all-round reduction of 25 per cent* on the total amount budgeted for armaments.

Taking the whole volume of money spent on armaments in the world—more than £800,000,000 a year—we say that the outcome of the conference should at least involve as a first step the reduction of that sum by a quarter. For national safety, we claim, has been immensely increased by the establishment and ever-developing activity of the League of Nations, by the remarkable progress in the organization of arbitration, by the Locarno agreements, by the Briand-Kellogg Pact, and by the convention for giving financial assistance to a state victim of attack.

That is not to say that we believe "security" to be completely achieved. Fear of war between members of the new international society, the imperfect understanding of and provision for the united action of this society in preventing and suppressing war and in eliminating the causes of war—all that stands in the way of the "more complete disarmament" which the federation believes to be necessary. Hence our statement declares that in order to secure further progress, "means should be sought to strengthen the mutual guarantees of security and loyal observance for treaties." In addition to the familiar means to that end, we made radical proposals concerning two formidable aspects of modern warfare, namely, the air arm and the chemical arm. We called for "the international organization of aviation under the auspices of the League of Nations, in order to insure to the Council the best means of communication and of supervision; and the prohibition of all preparation for chemical and bacteriological warfare."

The suggestions become of particular importance when read with the fourth section of the Budapest resolutions. It is in the following terms:

It is indispensable that the League of Nations should officially recognize the principle of equality in disarmament between the "vanquished" and the "victorious" Powers, and that the 1932 conference must begin to effect such equality.

This equality must not be attained by increasing armaments already reduced under the treaties, but by the proportionate reduction of those of other states.

In any case, the federation considers that the principle of limitation and reduction of armaments should be the same for all states and, consequently, that

1. Each state should be bound to limit the amount budgeted for its navy, army, and air force.

2. The prohibition of certain material, naval, land, or air, enjoined in the treaties should apply to all states signatories to the convention.

3. The observance of the obligations thus contracted by the states should be insured by a Permanent Disarmament Commission established at the seat of the League of Nations and exercising its control equally over all nations.

Each of these paragraphs deserves a word of comment. By the first the broad principle of equality is laid down. It is declared that no special regime in the matter of disarmament can be indefinitely maintained for particular countries. To most people that will appear little more than a platitude. Apart from all other considerations, how is it possible to have two classes of members of the League of Nations, one of which can be trusted with unlimited armaments, while the other cannot? Such a state of things is contradictory to the fundamental conception of the League, and can only be tolerated as a transitional measure while the League disarmament schemes are being worked out. The resolution proposes that the first steps toward equality should be taken at the conference next year.

Secondly, it is laid down that equality must be aimed at by leveling down and not by leveling up. We are about to engage on a scheme for disarmament. It would be tragic if it ended only in rearmament.

Thirdly, the resolution proposes that, apart from the strength of the armaments of different countries, the methods of limitation and reduction should be the same for all countries. For instance, if and so far as it is decided that budgetary limitation should apply to any countries, it should apply to all of them. Similarly, at least in principle, prohibition of particular kinds of armaments should be accepted equally by all countries. For instance, the "vanquished" countries are forbidden to have military aircraft. That prohibition might well be made general. It is here that the provision for the internationalization of aviation becomes important. For if there is to be no national air force, international precautions must be taken to prevent the conversion of civilian aircraft into military machines. Finally, whatever control is agreed to for the supervision and enforcement of the disarmament treaty should be applied equally to all states whether "vanquished" or "victorious." This is clearly right and desirable. Nothing can be said in favor of insisting on special precaution against the breach of disarmament obligations in the case of particular states. Whatever is useful to secure performance in one case is or ought to be equally useful in others.

This principle of equality is fundamental to the Budapest scheme. It was unanimously accepted there after it had been unanimously drafted by a subcommittee which met at Paris a few weeks earlier. The changes made in the draft did not weaken any of its main principles. What will the governments say to it next year? If they accept it, agreement will be comparatively easy, for it ought not to be difficult to carry out the principles of the resolution into actual figures.

All that can be said at present is that delegates from France, Germany, Italy, Belgium, Hungary, Poland, Britain, and other countries assented to it in Paris and after several weeks' consideration repeated their assent in Budapest. How the proposals will be regarded in other countries remains to be seen. In my country I believe they would be warmly and generally accepted. I trust the same may be true elsewhere. For in this case governments will do no more and no less than public opinion approves.

In conclusion, let me once again appeal to all friends of disarmament. M. Briand indicated the plain duty of all good citizens of Europe and of the world when he said at the Council meeting of the League in January: "Between

now and the opening of the conference a great propaganda effort must be undertaken to enlighten the mind of the public on this important question." I believe that all who write or speak upon disarmament or study the problem will find in this statement of the Budapest congress a guide to such "propaganda effort." For here is a policy in which the genuine requirements of France, Germany, Great Britain, and Italy—to mention only those among which marked divergences have appeared in the last few months—may be harmonized and fulfilled, if only the governments, setting aside the sinister suggestions of experts and armament manufacturers, will rely solely on the instincts and aspirations of the common people.

In the Driftway

NOW that summer days, with their attendant humidity, bare-legged young ladies, and weekly drownings are well established among us, the Drifter wishes to come out unrestrainedly for watermelon. A few years ago he would have scoffed at the thought that such a championship was in any way necessary. But of late he has been hearing things. The watermelon contingent does not seem quite so large or so enthusiastic as it used to be. Aspersions have been cast in his presence. Watermelon, according to one unsympathetic and soulless observer, is no better than a glass of water sugared and colored with cochineal. To this heresy the Drifter would oppose the full force of his ripe years, tested wisdom, and world-wide experience. Watermelon, at its best, is no tumbler of pink sugar water. It is ambrosia, delicately flavored, cool, crisp, rosy. And anybody who doesn't think so is an unfeeling, shortsighted ignoramus!

* * * * *

NOTE, however, the qualification. Watermelon—at its best. Its best is not found in cities; it is not found, indeed, north of Mason and Dixon's line. There are actually those persons whose sole acquaintance with watermelon consists in the round, red, flabby "melon balls" served up in a glass cup at the more expensive restaurants. There are others who have eaten their melon in large, natural slices, but who, nevertheless, never tasted, smelt, or felt any but melons picked green and "ripened" on a freight car traveling north. The true watermelon lover, however, knows that the fruit in this state should be shunned like the plague. There are ways to eat watermelon; there is, in fact, one way. Pick a nice, sunny slope adjacent to a watermelon patch. Invade the patch, keeping a wary eye out for its owner. Choose your fruit: it should be large, deep green, and give forth a gurgling sound when shaken. Run quickly to your slope, the watermelon under your arm. Drop it on a convenient stone. It will burst lusciously, scattering seeds—black seeds—at your feet. Pick up the pieces and eat them as fast as you can, stopping for breath only when absolutely necessary. You will soon learn to shoot the seeds out of one side of your mouth while absorbing melon with the other. When you are filled to repletion, walk slowly to the nearest brook, bathe hands and face in the cool water, and lie down to sleep in the sun.

CONSIDERATION of this technique shows at once how ill-prepared most northern city dwellers are to express an opinion, favorable or otherwise, on this king of fruits. Indeed, city dwellers, who sometimes boast that they enjoy fresh fruits and vegetables all year round, do not know what blasphemy they speak. String beans eaten in New York in December are a travesty of beans grown in a New England garden at the proper time, which is August, picked as soon as the dew is off them, plunged at once into boiling water, and eaten hot with butter. Strawberries displayed in January should be passed by, with head averted. They are only shadows of their true selves. But the worst urban vegetable tragedy is sweet corn. Some laboratory worker once announced that sweet corn lost 75 per cent of its flavor within three hours after it was picked. The Drifter is able to state on confident authority that it loses 100 per cent before that. Small yellow corn, picked, cooked, and eaten within an hour, is a dish for the more fortunate of the gods. The large, rubbery, tasteless ears that pass for corn in city markets are not fit for human consumption. Any self-respecting pig, indeed, would, except for necessary tooth exercise, inevitably pass them by.

THE DRIFTER

Correspondence

Greetings from Mr. Pound

TO THE EDITOR OF THE NATION:

SIR: If you have two pages to spare to a serious discussion of "Ulysses" and Gilbert's "program notes," why haven't you a few lines for the degraded and gorilla-made law which prevents the publication and sale of the masterpiece in our dithering and Hoover-messed fatherland?

Is an infamy less an infamy because it continues from decade to decade?

Rapallo, Italy, June 23

EZRA POUND

A New Party

TO THE EDITOR OF THE NATION:

SIR: Do you not think that the time is now ripe for launching a third-party movement? The only possible way that present conditions can be straightened out is through political action. People sit back, discuss, and criticize the present state of affairs. It surely would avail them more and also help to gain recognition if they organized a new strong party. The two old parties have shown that they are unable to cope satisfactorily with the present situation.

Why wait? Parties begun in a Presidential year, centered around one man, usually die out after election.

How many of your readers agree?

New York, July 4

GEORGE W. J. CHRISTENSEN

Mr. Hoover's Opportunity

TO THE EDITOR OF THE NATION:

SIR: Your editorial entitled President Hoover's Great Action in *The Nation* for July 1 strikes me as being somewhat hysterical. You speak of Mr. Hoover "grasping a great oppor-

tunity," and of our perhaps dating "the rescuing of the world from its present economic chaos from the day of Mr. Hoover's message." But Mr. Hoover has grasped no opportunity. By the stern force of circumstances he has been pushed into making a step which should have been taken long ago. Mr. Hoover, at last recognizing the storm, has reluctantly decided to come out of the rain. He deserves no more credit than any other politician who does likewise.

Macon, Ga., June 29

JOHN D. ALLEN

The Chamorrans

TO THE EDITOR OF THE NATION:

SIR: For over thirty years the Navy Department has been custodian of the welfare of the 15,000 Chamorran inhabitants of the island of Guam, but now that times are hard it finds it advisable to abandon its humanitarian work and look more to its guns. What is to become of the Chamorrans if the island is put under the custody of our Interior Department as a national park? This suggests a playground for tired San Francisco business men, a Pacific Madeira, where the natives can scrub casino floors and serve up the drinks—hardly a just fate for a self-respecting race, which the first American administration found not so badly governed by the Spaniards.

My father, the late William Edwin Safford, who acted as first American lieutenant governor of the island, and who undertook most of the island's administrative duties while the governor was making the place a coaling station, did a splendid piece of work in issuing titles to all the landholders of Guam at a time when carpet-baggers from the States threatened to gobble up all the land and make the natives work for them, but I have heard that subsequent administrators have not been so scrupulous about the natives' rights or so farsighted in their social policy.

Now that we have a Great Humanitarian at the helm, why cannot the United States show that it can be the equal of Denmark, whose policy of "Greenland for the Eskimos" costs \$100,000 a year, but insures the future well-being of the inhabitants? If the people of Guam have suffered from thirty years of American rule, after having prospered for three hundred years under Spain, whose is the guilt?

Newmarket, Ont., June 15

D. WADE SAFFORD

An Impromptu Barbecue

TO THE EDITOR OF THE NATION:

SIR: In Wolf Creek Canyon a power company which has grown from a small, wood-burning electric plant for Butte to a rating of one hundred million dollars is digging a ditch to bring natural gas 273 miles to smelt copper ore at Anaconda and heat our nearby cities. A week ago there were 300 men on the job and 300 more there hunting a job.

A bakery truck appeared loaded with bread for the commissary. At least 150 men surrounded this and firmly took all the bread for immediate free distribution. A hungry clergyman, munching a dry loaf, pointed to a prime steer grazing nearby, with the remark, "It is written: 'Man shall not live by bread alone.'" Inquiry revealed no firearms in the assembly. A cowpuncher and butcher agreed to use a rope and knife instead of the more modern hunting implement. The steer soon became dressed beef. A barbecue was soon under way directed by a lank youth who claimed skill at the art. At this time the sheriff appeared in answer to a telephone call from the rancher who had lately owned the steer.

The executive of the law loudly asked, "Who robbed the bread wagon?" About 150 men rose and sang out in chorus, "We did." To the second official inquiry, "Who killed the steer?" another platoon of 150 loudly admitted the imputation.

The sheriff of Helena does not lack a sense of humor. He also has some regard for his taxpayers. After a few minutes aside with the rancher (one of these taxpayers) about the expense of keeping 300 men until the next term of court and the folly of seeking a conviction, he said, "Boys, a barbecue is mighty flat without coffee, sugar, or salt. There is some at the commissary; here is ten dollars to buy it with." He added, "I hear some of you fellows have been fishing in Wolf Creek. This is a closed stream until 1934 by order of the game warden. Stop that fishing short off, or I will put you in jail powerful quick." Then he departed.

Butte, Mont., July 4

LOWNDES MAURY

Cobden's House

TO THE EDITOR OF THE NATION:

SIR: Americans who may be visiting England this year, and especially those who are interested in international peace, Anglo-American friendship, and tariff questions, may be glad to know that Richard Cobden's home at Dunford has been opened to the public as a guest house, and that there are a number of rooms available for visitors who wish to enjoy a few days in the delightful woods and surroundings of Midhurst. It has been furnished by Cobden's surviving daughter, Mrs. Jane Fisher Unwin, with Cobden's furniture and with pictures and curiosities of all kinds, including records of his interest in the United States and of his dealings with Napoleon III, with whom he negotiated the Anglo-French treaty of commerce in 1860.

London, June 29

FRANCIS W. HIRST

A Correction

TO THE EDITOR OF THE NATION:

SIR: I beg to correct an error in your issue of July 1. In the review of a book entitled "Noguchi," by Gustav Eckstein, the reviewer speaks of the subject of the book as Yone Noguchi. This should read Hidei Noguchi. Yone Noguchi is the author of several books of poetry and essays on art and kindred subjects, and is still living. Hidei Noguchi is the distinguished scientist who lost his life in Africa while studying yellow fever.

Bar Harbor, Me., July 3

LEONIE GILMOUR
(Mrs. Yone Noguchi)

An Appeal for Mercy

TO THE EDITOR OF THE NATION:

SIR: The Court of Appeal of Zagreb, Croatia, in its capacity of a delegate court of the Special Tribunal for the Protection of the State of Belgrade, Serbia, the latter court being too busy with other repressive trials, sentenced on June 30 two young Croat Nationalists, Mark Hranilovitch and Matthew Soldin, to death, and ten other members of their group to 115 years of prison, for the assassination in 1929 of Anthony Schlegel, editor of a pro-dictatorship daily, though it was established before the court that the two real perpetrators of the deed had succeeded in crossing the frontier in time.

All the accused, several of whom were acquitted, were subjected to cruel tortures in the police jail of Zagreb, and the sentences were based on confessions extorted by torture.

Two of the men sent to prison for twenty years—Stephen Javor, a respectable merchant and ex-alderman of Zagreb, the Croat capital, and Anthony Herceg, a journalist—were cruelly emasculated by the "investigating" officers. These two and several others have been made cripples for life.

An appeal for intervention in these cases is being made to leading Europeans and to international organizations, such as M. Briand, T. G. Masaryk, the League of Nations, the League for the Rights of Man, and so on. I join this movement by appealing also to the enlightened section of American public opinion.

Intra Muros

By LESLIE NELSON JENNINGS

Something that might have issued from a line
Of Druid ancestors became his feud
Against the Builders; he had seen their sign
Before the rape of many a solitude
Had left behind a city of the dead.
But he outran them, setting up a wall
About a plot of woodland where, he said,
No road should enter and no tree should fall.

There were no paths, no mark of ax or spade
To break upon that older unconcern,
Of which his love of quiet was the link.
Yet by a deeper hush he stands betrayed—
The deer no longer bed among the fern,
Or in the heat of noonday come to drink.

The End of Reparations

The End of Reparations. By Hjalmar Schacht. Jonathan Cape and Harrison Smith. \$3.

NEVER was there a more timely publication than this. In the week in which the fate of the entire financial world has been trembling in the balance as the withdrawal of foreign credits and balances has been threatening every bank in Germany, the former president of the Reichsbank publishes in the United States his book which first appeared in Germany half a year or more ago. More than that, this same week has seen him suggested as a possible dictator of the German currency—this same Schacht who resigned the presidency of the Reichsbank because of his opposition, not to the Young Plan, as has been alleged, but to the policy of the Allies in overloading and amending the Young Plan with subsequent conditions and demands which, as he says, went directly contrary to the plan and the spirit in which it was to have been accepted and lived up to by both sides. Especially was he opposed to the sanctions clause inserted by the French in the final Hague Protocol, which was precisely what Owen D. Young wished to avoid. Naturally Herr Schacht quotes from his letter of resignation one passage which he doubtless now feels to have been completely vindicated by the most recent events:

Since, in place of this peaceful economic agreement, each of the creditor Powers has reserved its freedom of political action against Germany, it has become quite impossible for Germany, without endangering her exchange and economic life, to accept the responsibility laid upon her by the Dawes Plan to collect and pay the tribute. So long as a political threat hovers over Germany, her interest rate and her credit will both be impaired, and the unremitting pressure to keep the mark stable will invoke restrictions of credit and deflation crises which will be a constant menace to German economic life.

Even more striking is the following exact prognosis of what has just happened in Germany:

But a sudden call to repay foreign credits would strike the Reichsbank particularly hard, for naturally the first draft would be made upon its supply of gold and exchange. It is well known that the Reichsbank is required to maintain a reserve of 40 marks in gold and exchange against every 100 marks issued in the form of

notes. Now if the gold and exchange reserve were suddenly to drop, let us say 400,000,000 marks, the Reichsbank would be entitled to a note circulation of not exceeding one billion marks, whereas the present circulation averages more than four times that figure. It is obvious that a sudden calling in of foreign credits would not endanger the stability of the currency or Germany's capacity to pay, but that such an event would have catastrophic consequences upon German economic life, and devastating effects of a social and economic nature.

Herr Schacht's volume is, of course, highly partisan and not without political tinge. It has the merit that it does not hesitate to criticize the author's own country and its recent governments. The last administration of Hermann Müller he holds responsible for Germany's surrender on the question of the additions to the Young Plan. The Socialists he attacks for their piling up of those municipal, communal, and state debts against which Parker Gilbert warned so earnestly when Agent General of Reparations, and for the "welfare measures, the bad economics, and the expensive bureaucracy of this Marxism." He fails, however, to cite the defense of the Socialists—the necessity of employing idle men in public works and the great need of communal welfare institutions to keep content the public which has been so sorely tried by the terrible burdens and tragedies of life in Germany since August 1, 1914, and to head off communism. That there was loose financiering and extravagance cannot be denied. But Schacht writes about these things in the spirit of the conventional, reactionary capitalist. Germany's "commercial and economic enterprises are almost exclusively conducted by able and conscientious men who are fully aware of their economic and financial responsibilities." But when the political state "goes into business" and "production falls under the influence of men without training who are primarily politicians"—only then does a "menace to productivity and credit occur"! How Herbert Hoover will purr in sympathy if he reads these words!

But whatever Herr Schacht's limitations because of passion, prejudice, and point of view, he is everlastingly right in his main contentions on reparations and debt policies. One may smile at the complete fallacy and the outworn imperialism of his arguments as to Germany's colonies; one may wonder, after reading his memorandum of April, 1919, at his daring to scold others for mixing politics and economics; but he says what is true when he reiterates that "thus far the reparations system has been kept functioning only by means of foreign loans," and that "the Treaty of Versailles and the reparations requirements have plunged the world into moral and economic chaos." He insists that there are still two ways out of this chaos—one, the reconstruction in honesty, truth, and justice of the treaty; the second, the enabling of the Germans, if reparations are to continue, to earn them by the expansion of their European markets, by the leveling of tariff barriers, and so on.

As for the title of Herr Schacht's book, I agree with its correctness. The end of reparations is at hand. As Wendell Phillips said of American slavery after the John Brown raid, "True, the slave is still there. So when the tempest uproots a pine on your hills, it looks green for months, a year or two. Still, it is timber, not a tree." So the present financial tempest is completing the uprooting of the whole reparations business. France may swear that it still lives—it is but timber. While the controversy goes on, and the nations of Europe fight for their very existence, this book of Dr. Schacht's is an invaluable book of reference. It has indispensable facts and figures, some material not printed elsewhere, and a point of view that one must know to understand and judge the whole situation.

OSWALD GARRISON VILLARD

Holy Terror

Memoirs of a Terrorist. By Boris Savinkov. Albert and Charles Boni. \$3.

IN the early teens of this century the Russian revolution was clearly divisible into three major schools. The Mensheviks were beginning to straggle on their long journey toward the shoddy Golgotha of counter-revolution. The Bolsheviks were making for bolshevism. And then there were the Socialist Revolutionaries.

Of these three schools the Socialist Revolutionary Party was the oldest, by far the largest, the most Russian, naive, romantic, and sentimental. Its left wing especially may be said to have been the Russian version of utopian socialism. It was the direct descendant of the "will of the people" of the '70's, which had been a sort of purple Franciscanism, characterized by an almost libidinous love of the masses. Many of the Socialist Revolutionary leaders came from the upper and noble layers. Their philosophy was a mixture of romantic anarchism, simple-minded syndicalism, and a highly visionary democracy—all rather eccentrically interwoven into a bigotry of sweetness and light and a martyrology of direct action. They were at once mystic humanitarians and believers in political assassination. The noblest among them were neurotically noble, conscientious objectors to all realism of which they disapproved. Their physical courage and their sense of revolutionary dignity amounted to a psychosis. On the whole, they were more Bakuninist than Marxian, more anarcho-syndicalist than modern Socialist. The October revolution finished them in a few months. Yet their influence on the course of the whole Russian revolution was profound, ineffable, incalculable. They were as Russian as the Russian novel of their day. They expressed the revolutionary reaction of the Russian people to three centuries of sadistic autocracy. In them the Russian revolutionary movement was half-crazed into magnificent tragedy by a Caliban order.

The Socialist Revolutionary Party had a terrorist section, the far-famed and feared "fighting organization." The function of this secret unit, whose active membership never at one time exceeded about a dozen effectives, was to condemn in committee and then to assassinate the most notorious and noxious of the political tyrants and perverts of the Czarist regime. These terrorists were the red vigilantes at a time when the spirit of the revolution was being stifled by persecution and inertia into a nihilistic pessimism. Since the party as a whole had no clear-cut revolutionary outlook, its terrorist section, with its underground personnel, tended to drift away from the sociality of the revolution into a terrorist monkhood. The terrorists lived altogether in a revolutionary underworld, moving in and out of Russia with false passports, names, occupations, living in a narrow circle of pure conspiracy, in an endemic state of mortal danger within the very web of a martial and corrupt secret police, in a revolutionary insane asylum in which one's best friend might be an *agent provocateur*. Homeless, loveless, non-social, their whole life was focused on one act: to mix their own flesh, blood, and brain with that of their victims so that the detonation of their self-sacrifice might awaken the world to the criminal order which was then Russia. And the world of the first decade of our century did watch their heroic, hair-raising, unequal, and crazily lofty struggle with breathless attention.

Savinkov's "Memoirs" cover the most exciting period of terrorist activity, from 1902 to 1909. He supervised the assassinations of von Plehve and the Grand Duke Sergius, the attempts on the lives of Dubassov, Durnovo, and the Czar. He tells in detail the amazing story of Azev, the chief of the ter-

rorist section, who proved to be a police spy, a revolutionary centaur, half honest revolutionary, half provocative agent, possible only in a fantastically diseased social order. Father Gapon, an infinitely weaker edition of Azev, was also unmasked as a stool pigeon. Savinkov was by no means among the nobler of the great terrorist figures, such as Vera Figner or Gershuni before his day or his coworkers Kaliayev or Sazanov. But he was a colorful desperado. In time the social revolution receded more and more from his ideologically feeble mind, and he became ever more the secret agent of professional revolutionary vengeance, an engineer of political terror and assassination, a technician in the catacombs of conspiracy. Needless to say his "Memoirs" are a spectacular Odyssey, which no tale of fictional adventure could possibly rival.

For a while Savinkov was a member of Kerensky's Government. In a government he felt like a fish out of water. His conception of all government was intrigue and conspiracy. He was violently anti-Bolshevik, fundamentally because the Soviet state had a goal. In a state of complete spiritual deterioration he joined one white movement after another, actually instigating the pogroms of Petlura and managing the crimes of Kolchak. But the failure of the white movements and, possibly, his own revolutionary past and subconscious impulses drove him to re-enter Soviet Russia, where he was caught; and recanted. The Soviet government treated him more like a psychopath than a responsible counter-revolutionary. He was sentenced to ten years' detention, given a library, a car, a chauffeur. But the reconstruction period did not require his Promethean conception of revolutionary sacrifice. Its "terror" was social and not conspiratorial. It was a dictatorship, not an underworld. The Russian revolution, even if it had trusted him, no longer needed the only thing he had to give—his almost acrobatic capacity to hold his life in the palm of his hand. And being useless, he wound up the logic of his life by bashing out his brains. In spite of his social sadism after the October revolution it is difficult to be hard on him. In his "Memoirs" he shows himself as a splendid gangster of freedom when liberty was the greatest of crimes.

BENJAMIN STOLBERG

Robert Burns

The Life of Robert Burns. By Catherine Carswell. Harcourt, Brace and Company. \$3.75.

MISS CARSWELL'S biography is well documented, accurately detailed, and carries the reader back through two generations of its subject's ancestry; but it is also written with charm, and with a frequent but unobtrusive wit like that of a Strachey in a shy mood. Thus it stands high by the measure of the two main traditions in biography; it achieves many of the merits of both where similar and more deliberate efforts usually achieve little of either.

The first fourth of the book is the longest to read, as it probably took longest to prepare. The material is fresh enough and, in retrospect, relevant. But the chill of duty is upon it. Mrs. Carswell's determined brick-laying of data and incident here makes similar labor for the reader. The account of Robert's father is itemized enough and almost long enough to form a separate, brief biography. But William Burns, good and admirable though he was, does not provide entertaining biographical substance. It is here that Miss Carswell's writing, which later becomes firm and edged with penetrating phrases, is dulled by detail.

There is nowhere in the book an iconoclastic attitude, yet it succeeds in breaking the Dionysian idol of those who are worshipful of tipsy and irresponsible genius; and at the same time it destroys the myth of the Bad Example.

Burns was not a gipsy nature. He traveled much in Scotland itself, but his wanderings were not aimless. On his most care-free tours he was at work hunting up tunes and verses for his collections of Scotch folk-song. So little was he the rover that the prospect of a trip to London upset him; and after a long time the project of a journey to the West Indies as an escape from his troubles obsessed him as a nightmare rather than allured him as an adventure. Far from being irresponsible, Burns was persecuted by his sense of responsibility. He was a typical child of a poor but respectable family, constantly on the edge of insolvency. He grew up with a morbid consciousness of insecurity, a hysterical fear of debt. It was to be with him to his last days, when an unpaid bill worried him perhaps out of a fortnight of life.

To his bastards, and to the women who bore them, he was tender and considerate. His first affair was, traditionally enough, with a servant in the house. He refused to marry her, for good reasons, but he kept the child, who stayed with him in the household of which his father's death had just left him the master. His subsequent affair with Jean Armour gave him another bastard, which also he supported; but this time Robert sought to marry the girl and was rejected by her parents. Many years afterward, when his reputation awed away their resistance, he did marry her. Mary Campbell, whom he took up with after his rebuff by Jean Armour's parents, he married by a signed agreement on paper, which according to Scotch custom was as valid as a certificate. Had she not died in an unfortunate pregnancy he would have added the formal rites. His affairs in Edinburgh were in a sense forced upon him by the snobbishness and frigidity of the ladies in polite society. His proposal to one was dismissed with hauteur; his intimacy with the more bending but preposterous "Clarinda," Mrs. McLehose, was constricted to the maddest platonic love that has left a literary memorial. Women being a necessity to him, he resorted to frank and willing barmaids. His feeling for women, however, was in every generous sense an honorable one. He was tender, loving, and respectful. There was not a trace of cynicism in it. He did not make conquests; he loved—happy to give and grateful for what he received.

Mrs. Carswell says that his character was flawed, but is there in all humanity, in all times one unflawed? Burns was proud, egotistical, at times vain; but his humility before the memory of poets he admired was noble. He was often cringing, but living in a caste-conscious age he could hardly help himself. He dared often to think himself the better man, but tradition, environment, habit, and policy as well, since the lords were the holders and bestowers of privilege, forced him now and then to flatter; and always, when sober, to guard his tongue. He was a libertarian; but when the government instituted repressive measures he shrank from the liberals and joined the patriotic volunteers. It was undignified, even cowardly, but he had his exciseman's job to protect, the job in which he had "made good" and earned income enough to give him a sense of security. He was in the situation that harasses and makes a mess of the principles of the white-collar class always and everywhere.

Where his nature did not come into deforming contact with society, he shows a clear, free, and generous spirit. In spite of his terror of poverty, Burns never sought to make money from his writing. To the end he had a decent respect for his art that was innate and powerfully self-assured. He did not seek publication; he had the wisdom and the good fortune to make his chief audience his family and his neighbors. The satisfaction he got from his poems was thus direct and immediate. Instead of the delusive cold permanence of print he had the warm, living permanence of the human memory. The people, not having much in the way of letters, kept what they fancied in their heads.

This habit of depending upon the memory was of infinite value to Burns. It enabled him to compose while he was following the plow or doing any other of the farm tasks that can be left to habituated muscles while the mind is free. He would bring home to be written down at night whole poems, composed and memorized in the field.

To what he loved he gave a generous loyalty. For another rustic poet, Fergusson, who had died in neglect in Edinburgh, he gave twenty pounds out of his own security to raise a monument over his grave. Loving Scotch folk-song, he devoted himself to its preservation, and had the taste to prefer the native tunes to the vulgar "arrangements" then thought necessary to make them presentable in a lady's parlor.

It would have been fortunate perhaps if Burns could have stayed among his own farming people. The unjust economy of tenant farming of his day made this impossible. To secure a job with the help of patrons to be found in Edinburgh he went outside his class. He was lionized but also condescended to. He got his job but it took him long enough to gain a bitterly true knowledge of his "superiors"; too long to make his return to farming and to his own people palatable or even possible. The outcome was a conflict which in turn produced a neurosis that was to torment him to the end.

Mrs. Carswell has written a distinguished biography. It gives us the man, the poet, and his time. The biography leads one irresistibly to a rereading of the poet, which is perhaps its chief service and one of its greatest pleasures; and it is astonishing how closely the poet thus rediscovered fits into the man Mrs. Carswell has portrayed.

ISIDOR SCHNEIDER

Death, Destruction, and Power

Hatter's Castle. By A. J. Cronin. Little, Brown and Company. \$2.50.

NOT since "Wuthering Heights" have we had a horror story that so completely satisfies all the requirements of the genre. *Hatter's Castle* is the home of a great, blustering, egocentric paranoiac, a hatter in a small Scottish town fifty years ago. James Brodie is convinced of his noble birth; he is a large, handsome man, domineering, brutal, deluded with visions of his own grandeur. The tale of his downfall, which is brought about by the destruction or death of every member of his family save one, makes the book. At the end he is a skeleton of his former self, destroyed by drink, by the failure of his last hope, by his own vast, vain aspirations and desires.

Nothing is left out of the book to make it terrifying. There is first the house itself, a stone absurdity, the replica in miniature of some Scottish castle, the "last house on the road," which "suddenly chilled" the sweet spring wind that struck it. There is Brodie, so large, so completely the master of his household. There is the household itself: the wife, a poor, sniveling creature, reduced to abjection by her husband and to die horribly of cancer; the older daughter, lovely, gentle, courageous, yet not quite able to cope with her brute of a father, got with child by her lover who is killed before he can marry her, thrown out of doors by her father in a raging storm, making her pain-racked way through beating rain, rushing torrents, howling wind to shelter in a cowshed where her child is born; there is the worthless son, unable to look his father in the eye, robbing and lying to his doting mother, running off with a barmaid who is at last his father's only consolation in life; and last but not least the younger daughter, destined by her father for the university and a prize-winning scholarship, urged to study day and night, pale, weak, apt, but so terrified of her father's rage that, when the great moment

comes and she loses the prize, she hangs herself from the kitchen ceiling, her father's last remaining hope.

This, of course, is not a cheery tale. But the horror story is meant not to cheer but to harrow, and Mr. Cronin has faithfully fulfilled his task. He has done more. His story is differentiated from the ordinary example of its class in two ways. One is his successful combination of romantic terror and realism. When it is necessary to present a scene of unhappiness or desolation or sordidness, no pains are spared to make the picture clear. None of the elegant circumlocutions which sheltered the reader of earlier tales is employed. A spade is described as it is, and if filth clings to it, then the filth is given its proper name. Moreover, Mr. Cronin, incredibly enough, inspires pity in the reader for James Brodie. The last scene in the book, indeed, is so completely horrible, with Nessie pitifully hanging from the ceiling, her schoolbooks piled on a chair beside her, her poor little hat with its new ribbon awry on her head, that no reader could possibly be flint-hearted enough not to look with compassion on the bent, racked figure of her father. He might have been a cheap, stock-company villain, brought to his comeuppance by the forces of goodness and righteousness. He is, instead, a tragic figure, destroyed by his own great vices, a man of strength brought to dust, an Oedipus putting out his own eyes through his own folly.

It is this fact that distinguishes Mr. Cronin from other writers who have attempted the same feat, that, indeed, makes him with this, his first novel, a novelist to be watched and reckoned with. His Mary is all that is beautiful, good, tender, and pure; she is not ridiculous. His Brodie is the embodiment of all villainy; he is nevertheless tragic. Black is black, with Mr. Cronin, and white is blinding white. But because of his frankness and his courage, because he is not afraid of the heights and the depths of his characters, he achieves something of the mighty eloquence that must be in all novels before they are great.

DOROTHY VAN DOREN

"Excellency—a few goats . . ."

When the Wicked Man. By Ford Madox Ford. Horace Liveright. \$2.50.

IT is in that most charming of adventure tales "Romance," on which Ford collaborated with Conrad, that the deathless line appears. A villainous, piratical, but fearful fellow is called to the witness-stand. Ford is doing the writing:

"Of what occupation?"

"Excellency—a few goats . . ."

"That," Conrad exclaimed delightedly, "is genius!"

Mr. Ford, even back in those days, sincerely considered himself (and few seem to have disputed him) the best living English stylist. Good style, he once wrote in effect (I am depending upon memory), is the art of prodding one's readers by giving them a constant succession of slight shocks. He himself has dipped into the same bag of tricks all these years, and they never fail to please—especially the fastidious reader. Sentences, phrases, adjectives, all kinds of words and word combinations are arranged in almost but not quite the usual way. He is a stylist of many devices. One is to employ a hackneyed phrase—"Notterdam bit his tongue" (after making the wrong remark)—and then comment upon it—"He did not believe that people bit their tongues, but he had bitten his."

Mr. Ford is an avowed disciple of Henry James. In his own novels he seeks to convey to his readers the hidden nuances as mind impinges upon mind, attempting to give expression to those indefinable but ever-so-important mental and emotional reactions which the meanings behind a few words, or bits of facial or bodily expression, carry over from one person to

another as the spiritual state of each shifts uneasily about seeking an equilibrium, a defined opinion, whether in love, hate, excitement, wonder, pity, distaste, or mere indifference.

By reason of his apt touches, the freshness of his language, his insight into the mental and emotional responses of certain kinds of people, Mr. Ford, in a long series of volumes in varied fields, has made a valuable contribution to the literature of his period. The present novel, I venture to opine, stands near the bottom of the list. One can forgive him his incredible American scene—and surely Mr. Ford, who is (although, as Mencken used to say, *geb. Hueffer*) so thoroughly English, who is so familiar and sympathetic with France, is dead wrong on nearly all points when he generalizes about these States. One is merely amused when he has a high-school boy ask his sister if Anna Petersen in her class is "really such a swell fan in composition." But these people—these incredible shades—Notterdam and Kratch, Elspeth, Henrietta, and Lola Porter, and most of the others, all as sterile and fruitless as they are unbelievable, are unforgivable. Mr. Ford has nodded.

FRED T. MARSH

Books in Brief

Strange Thoroughfare. By Sonia Ruthèle Novák. The Macmillan Company. \$2.50.

This story of Esther O'Shane, the gifted, impulsive, unworldly, imaginative child and woman who, in spite of her three marriages and many experiences, remains congenitally ignorant of the practical world around her, of the small and mean and realistic aspects of daily living, is wrought into a moving and disturbing first novel. Madame Novák has developed an original technique in the telling of it which is full of possibilities. Chiefly by conversations she has built up an unusual novel structure, episode by episode. She has an original gift with the problem of dialects—the Southern, the Negro, the German, the modern vulgate, and others—and a decided talent in indicating in written conversation personal, regional, or colloquial idiom. By exercising greater restraint in emotional and dramatic scenes and by toning down a tendency toward obvious exaggerations, Madame Novák should write a second novel of outstanding distinction.

And No Birds Sing. By Pauline Leader. The Vanguard Press. \$2.50.

Miss Leader at twenty-two has written an impassioned, intensely personal story of herself. Her prose is simple, chaste, delicately wrought, beautifully adapted to convey her message without a touch of hysteria or false dramatics. Not that that message could ever be so important to others as to herself. One grows as the years pass, accepting the inevitable, callous to what passes as injustice. One learns that there is no such thing as justice—that there is merely a temporary balance in social adjustment which, we can only hope, may attain a higher level than the one which today places on the shoulders of ardent and sensitive youth an almost intolerable burden. Miss Leader is obviously the instinctive poet. Her problem in facing life began long before she became deaf. She does not spare her father and mother. She hated them. And yet she shows a certain objective understanding of what lay back of their cruelty and lack of understanding. She does not spare herself. She was proud and, in a small New England town, hated their Jewishness. But her sympathies, too, were large and wide—for was she not a poet? The story of her struggles in New York, alone and stone deaf and with an original capital of twenty dollars (for she had run away from home), are swiftly but movingly told. One cannot lay the book down.

Alexandrian Poetry Under the First Three Ptolemies: 324-222 B.C. By Auguste Couat. With a Supplementary Chapter by Emile Cahen. Translated by James Loeb. G. P. Putnam's Sons. \$6.50.

Couat's "La Poésie alexandrine sous les trois premiers Ptolémées," published though it was in 1883, is still the best general account of the Greek poetry, sometimes called Hellenistic, which we know in connection with the names of Callimachus, Apollonius of Rhodes, Theocritus, Aratus, and Eratosthenes. If only one of these poets is now widely read, all of them had their glorious day, and Callimachus, to whom fully half of the present volume is devoted, was and is of the first historical importance. Couat was prepared for his great task not only by learning and imagination but by a conviction that certain parallels existed between the Alexandrianism of Alexandria and the Alexandrianism of modern Europe. His book, therefore, has always been more than a treatise on late Greek poetry; it has exposed the anatomy of our contemporary decadence as well. It is a beautiful performance, and Mr. Loeb, who has already put every student immeasurably in his debt by publishing the Loeb Classical Library, has increased that debt by translating, with grace and fidelity, this portrait of a school of poets who, coming between the greater Greeks who preceded them and the greater Romans who followed them, taught the latter much of what they knew and so prepared the ground for modern literature. The supplementary chapter by Emile Cahen ably summarizes the knowledge of the field which has been gained through the discovery of new texts since 1883.

A New Model of the Universe. By P. D. Ouspensky. Alfred A. Knopf. \$7.50.

This is a medley of essays on modern themes written from the point of view of an esoteric cult. Although the essays profess to use the psychological method to reveal new knowledge in science, religion, and art, the only knowledge that a non-esoteric reader will derive from them is about the psychological workings of the esoteric mind. There are two major dogmas of esotericism: first, that there is a hidden reality not revealed to ordinary mortals or by the ordinary light of reason; and, second, that a knowledge of this reality was vouchsafed to a circle of initiates in time immemorial and has been kept alive in a secret tradition. Mr. Ouspensky's reflections on all topics are dictated by these two dogmas. Thus the technical mathematical conception of the fourth dimension offers an occasion for him to tell us what takes place in that dimension. Similarly

Einstein's theory of relativity, which formulates a verified inter-relationship between the measurements of space and time, is taken as an invitation to unleash his speculative imagination and to construct a "new model of the universe" in six dimensions, three of space and three of time (in accordance with the ancient symbolism of the six-pointed star). The doctrine of evolution is rejected in order to fit in with the esoteric claim that man fell from perfection. And so on.

The Black Napoleon: The Story of Toussaint Louverture. By Percy Waxman. Harcourt, Brace and Company. \$3.50.

This is a fascinating book about a fascinating character. And it is a timely book. So much interest has been taken in the Negro of late that one could almost have predicted that this age would produce its biography of the most remarkable black soldier, diplomat, and statesman in modern times. It is a pity, however, that Mr. Waxman carries his enthusiasm for his hero to the point of misrepresenting the history of the time. Slavery conditions in the French West Indies before 1789 were undoubtedly bad—liberal colonials like Dubuc and Malouet admitted it. But this author describes them for the most part with unrestrained rhetoric. Then there is the matter of the "white Napoleon." Mr. Waxman follows Henry Adams much too closely. Recent research in the history of the Leclerc expedition has shown that Bonaparte acted openly against Toussaint with the approval of England and the United States. President Jefferson, for example, had no desire to see develop in the Caribbean what he styled a "new Algiers." Toussaint was unfortunate enough to be weaker than Bonaparte. There seems to be no evidence that his incarceration in France particularly horrified contemporaries. It was, and is, a rule of war. How many today remember that a modern Toussaint Louverture in the person of Abd-el-Krim, the Riffian chieftain, has been languishing almost five years as a prisoner of state on the island of Réunion? And yet no Bonaparte rules in Paris.

The Quicksands of the City. By Hartley Withers. Jonathan Cape and Harrison Smith. \$2.50.

The former editor of the London *Economist* here attempts to lay down the principles of investment. He considers the relative merits as investments of bonds and common stocks, and strongly recommends that the inexperienced put their money in the securities of investment trusts. But the American reader must always bear in mind that Mr. Withers is talking of the English investment trusts; most of our own are horses of a very different color.

THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York. British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London, W. C. 1, England.

SENATOR BORAH has kindly given us permission to print the following paragraphs from a letter to a mutual friend, giving his view of the European situation and what it needs at this hour:

I agree thoroughly with the views which you express in your general discussion of the situation in Europe. My view is that there are three, possibly four, major propositions relative to the recovery of Europe. First, a revision of the Versailles treaty, a readjustment of reparations, the recognition of Russia by the United States, and drastic disarmament.

I admit at least three are difficult problems. But they are not so impossible by any means as the recovery of Europe without their adjustment. Europe can never recover under the peace treaties and Germany never can pay the reparations assessed against her. There will be no disarmament in Europe until the Russian problem is settled. We have been living in a fool's paradise, talking about disarmament and better times. And ever since the Versailles treaty was signed, we have been drifting toward the rapids.

We are happy, indeed, to give currency to these views, and rejoice that the Chairman of the Senate Foreign Relations Committee sees so clearly that there can be no peace in Europe until the Treaty of Versailles is revised according to the dictates of truth, humanity, and justice. We only regret that the Senator did not include, in the list of things

that must be done to restore Europe, the abolition of tariffs everywhere. As long as these unnatural barriers to trade exist, there will be constant ill-will between nations and talk of war. We rejoice, however, that the Senator has spoken out more vigorously on the world situation than at any time heretofore.

THE FRENCH MEMORANDUM to the League of Nations on armaments reveals anything but a cooperative spirit. It says, of course, that France stands ready to consider all general solutions, that it asks for itself "no unilateral guaranties," and that the French "are prepared to extend their unqualified collaboration to any system for the general organization of peace," though only upon "definite pledges of effective mutual assistance in case of aggression." The memorandum insists that France has done a lot in the way of disarmament, and that, for example, it has increased its military airplanes and seaplanes only from 1,180 to 1,210 (Germany, of which it is so afraid, has not one). It admits that it has 400,670 trained troops at home and 237,363 abroad, and that it has largely increased the number of professional, or lifelong, soldiers, while tremendously increasing the fortifications on its borders. As Robert Dell points out in his article which we print elsewhere, it cannot be denied that the French military forces are about the same now as in 1912, despite the complete disarmament of Germany, while French military expenditures have increased to the enormous sum of \$750,000,000. Here lies the real challenge to the world today.

WHAT IS DESCRIBED as "perhaps the most drastic economy order ever issued from the White House" has been sent by President Hoover to the heads of the various government departments and bureaus. In his letter of July 19 he called for the elimination or postponement of "all such activities as may be so treated without serious detriment to the public welfare." The President found that the various department heads were planning to spend more, not less, than they had spent in the fiscal year just closed, and this they were doing in the face of the fact that the last fiscal year showed a deficit of more than \$900,000,000 and that they had already been warned to cut down. Quite obviously, Mr. Hoover does not anticipate an early upturn in business which would increase revenue receipts to the point where they would balance normal expenditures. Indeed, the President more than once stressed the fact that the "situation is a serious one." But his position would have been much stronger had he emphasized the need for economizing when the depression began almost two years ago. We might then have been spared much of the current deficit, the existence of which, we fear, may be used in the coming session of Congress as an argument against the expenditure of government funds to help those who are suffering from the depression. Nevertheless, we welcome Mr. Hoover's action, especially because it appears destined to hit the military and naval services harder than any other branches of the government.

CHEERFUL, or even apparently cheerful, economic items are so rare nowadays that it is worth making the most of those we get. Curiously enough, the automobile industry seems to have done comparatively well in the three months ended June 30. For that period the General Motors Corporation reports an increase of 3.3 per cent in net income over that of the same quarter a year ago; the Studebaker Corporation an increase of 33.3 per cent. The Hudson Motor Car Company reports a net income of \$300,000 compared with \$226,000 in the same period of 1930; the Chrysler Corporation \$3,232,000 compared with \$3,228,000; and the Willys-Overland Company a net profit for the six months of \$305,000 compared with \$152,000 last year. Some of these gains in net income were achieved in spite of a falling off in sales; the volume of business of the Chrysler Corporation, for example, was only 77 per cent of that in the same period of 1930. In so far as the gains in net income are the result of new economies in operation, they are reassuring evidence that business in some lines has been able to make part of the readjustment that new conditions demand; in so far as the gains have been at the expense of labor they are of course less reassuring. But it is significant that the Studebaker Corporation sold more cars in the second quarter of 1931 than in the same three months in 1930, and that the General Motors Corporation reported an increase in number of cars sold of more than 6 per cent.

NOW THAT THE UNITED STATES has been awakened to the need for a major readjustment of war debts and reparations it would also do well to give serious consideration to the war-guilt question. It is true, as Foreign Minister Stresemann once pointed out, that Germany is not paying reparations because it may have been guilty of starting the war, but solely because it lost the war. Nevertheless, in fairness to that country we ought to do what we can to remove the black mark that has stood against its name these last twelve years. Impartial historians such as Professor Sidney Fay have effectively shown that the sole responsibility for the World War was not Germany's. Even Raymond Poincaré has indirectly admitted as much. More than that, this generous action would go far toward restoring the self-confidence of the German people, which they so sorely need in the present crisis. To this end the Shipstead resolution now before the Senate has been framed. It deserves the earnest and energetic support of all fair-minded Americans. It calls upon the government to take the necessary steps "to make it clear that it will no longer permit itself to be regarded, even by implication, under the terms of the treaty of Berlin of June, 1921, as acquiescing in the formal charge made in Article 231 of the Treaty of Versailles to the effect that Germany alone was responsible for the war terminated by those treaties."

PRISONS are overcrowded, dark, ill-smelling, and vermin-ridden; prison food is bad; prison discipline is cruel, stupid, and unyielding; prisoners are hung up by the wrists, doused with cold water, kept for longer than two weeks in solitary confinement on bread and water, beaten with a strap, and jammed two and three at a time in cells four feet wide, seven feet long, and six and a half feet high. These foul and desperate conditions under which prisoners in America of 1931 find themselves are soberly attested by the Com-

mission on Law Observance and Enforcement, whose report on our penal system has just been issued. The report declares flatly that the prison system of the United States is a failure:

We conclude that the present prison system is antiquated and outworn. It does not reform the criminal. It fails to protect society. There is reason to believe that it contributes to the increase of crime by hardening the prisoner. We are convinced that a new type of penal institution must be developed, one that is new in spirit, in method, and in objective.

This is a sweeping statement, but made by such a responsible authority that it cannot be pushed aside. It declares our prisons are unhealthful and extravagant; that our treatment of prisoners is cruel, ignorant, and shortsighted. These conditions apply generally to prisons over the country; there are practically no exceptions. Even the modern, electric-lighted, and more or less sanitary prisons constructed in the last decade are largely governed by the notion that the sole function of the prison is to keep the prisoner shut up. There the duty of warden and guard ends; thereby society is protected. We have been hearing for fifty years the pleas of penologists that the function of the prison is not only the incarceration but the rehabilitation of the prisoner. The present report indicates that these pleas have been largely in vain.

THE WICKERSHAM COMMISSION has been not only thoroughgoing in its indictment of our prison system, but has formulated an intelligent and careful program for the betterment of conditions. Its recommendations include classification of prisoners, segregation of the diseased and unfit, prohibition by law of brutal disciplinary methods, abolition of the contract system of prison labor and payment of a wage to prisoners for work done, the establishment of an efficient educational system in all prisons, greater use of indeterminate sentences and supervision of parole, and, last but not least, "broadening of probation methods so that no man may be sent to a penal institution until it is definitely determined that he is not a fit subject for probation." With the report's findings, painful and shocking as they are, anyone who is at all familiar with American prisons must agree; with the recommendations any intelligent person must agree also. There is nothing radical in these proposals, nothing that should frighten anybody; certainly there is nothing new in them—nothing that has not been said for years in the columns of *The Nation*. They have been made again and again by responsible body after responsible body. It is hard to say why they have not been heeded, why our prisons are among the worst, in physical conditions and in the treatment of prisoners, in the civilized world. Whatever the reasons for it, the fact remains. Our prisons are one of the dark spots on our civilization.

ALBERT B. FALL, who betrayed his country for a bribe of \$100,000 when a member of the Cabinet of the United States, has at last entered prison. If we feel a certain satisfaction about this fact, it is not because we believe in prisons as at present operated, or because we vindictively desire revenge upon this broken old man. Far from it; it is a pathetic thing that one suffering from several incurable ailments, among them tuberculosis, must at his age be con-

fined, even though only in a hospital ward. Yet we cannot but feel that if Fall had not gone to prison it would have been a grievous blow to the cause of justice everywhere. It would have intensified the widespread, and unfortunately too often correct, belief that there is one kind of justice for the rich man and one for the poor. It would have been pointed out that poor and friendless men who are ill of tuberculosis are committed to jail without question. Mr. Fall's last hope was his appeal to the clemency of Herbert Hoover, one of the men who sat beside him in the Cabinet of the United States, but never had the courage or sense of moral responsibility to lift his voice in protest against the rascalities of the Harding Administration. Mr. Hoover was the last man in the world who could have pardoned Fall, so it must have been easy for him to say no. But his own silence in the presence of the wrongdoing in which Fall participated will always be a blot upon the President's good name.

SOUTH AMERICA, with the help of the depression, continues to topple over its dictatorial presidents. The latest to go is General Carlos Ibañez of Chile. He has, said an official statement, "decided to abandon the presidency temporarily." His request for a year's leave of absence "in accordance with the law" was, however, abruptly rejected by the Chamber of Deputies. Thereupon he disappeared from the capital, leaving his office in the hands of Pedro Opazo, president of the Senate. The people of Santiago, who obviously know their dictators, stormed the American embassy in the belief that he was in hiding there. Like most South American dictators, President Ibañez used his control of the army to give him control of the economic life of the country. When he came into office in 1927 he instituted a number of agricultural and educational reforms, and he sought to strengthen the principal industry of the country by increasing the output and stabilizing the prices of nitrates. But these availed him nothing when he began losing his grip on the army. What was behind the disaffection in the military ranks which precipitated his overthrow has yet to be determined. It is nevertheless likely that unrest in the army simply reflected the growing unrest among the people which followed the dissolution of the world nitrates agreement. This compact was designed as much to protect Chile against competition from the artificial nitrates of Germany and France as it was to stabilize the world market. When the agreement was terminated a few weeks ago and prices began to slump, Chile was the first to feel the effects.

ONE NEGRO IS DEAD and four are missing as the result of a clash between Negroes and white officers at Camp Hill, Alabama. Sheriff J. Kyle Young of Tallapoosa County and one of his deputies were wounded in the affray. The reports describing the shooting and subsequent events are somewhat conflicting. Some say that the meeting the officers invaded with the intention of breaking it up had been called by the "Society for the Advancement of Colored People." The International Labor Defense declares the meeting had been arranged to organize a "share-croppers' union" to combine against the starvation wages being paid by Alabama planters. A third report asserts that the meeting was called to protest the death sentences imposed upon eight Negro boys at Scottsboro. Officials of the National Association for the Advancement of Colored People have denied that the

"Society" mentioned in the Camp Hill dispatches has any connection with their organization. But whatever the organization, and whatever the purpose of the meeting, the action of the authorities in breaking up this and a similar gathering held a few days earlier was clearly unlawful. We unqualifiedly indorse the telegram sent by the American Civil Liberties Union to Governor Miller, which asked "a thorough investigation and an executive warning to your officers to respect the rights of Negroes and others to hold meetings to organize and discuss their grievances."

UNDER THE PRESIDENCY of Clarence Darrow the Victor L. Berger National Foundation, Inc., is well on its way, with the active cooperation of its vice-presidents—Jane Addams, John Dewey, Glenn Frank, Elizabeth Gilman, James Maurer, and Upton Sinclair. The purpose is to create a fund of at least \$100,000 to aid the liberal press and, specifically, the establishment of a Socialist daily, or rather the maintenance of the Milwaukee *Leader*, which Mr. Berger founded and so long ably conducted. The idea is, however, that the foundation shall serve as a stimulus to the development of liberal newspapers throughout the country, in so far as its means may permit. Mr. Berger certainly deserved this recognition for his long services in the House of Representatives, his great public spirit, and, above all, his courage in telling the truth about the war in accordance with the best American traditions, for which an incredible judge passed a sentence of thirty-five years upon him—a sentence naturally done away with. B. C. Vladeck, of the Jewish daily *Forward*, is chairman of the board of trustees of the foundation and Stuart Chase is the treasurer; the headquarters are at 907 Fifteenth Street, N. W., Washington, D. C.

THE IMPENETRABLE AFRICAN FORESTS have been pierced with steel, and substantially the same journey that David Livingstone took two years to make is to be made by a railway train in a few days. The route is from Lobito in the province of Angola on the west coast to Beira in Portuguese East Africa on the Atlantic, a distance of 2,949 miles. The first train made the journey on July 1, crossing Portuguese, Belgian, and British territory. And the agent that worked the miracle—for to Livingstone, making his difficult and perilous way, it might well have seemed a miracle—is copper. Diamonds drew the railway north from Cape Town to Kimberley; gold drew it farther on to the Rand; copper has urged it on to Katanga, in the heart of South Central Africa. It is estimated that in a few years the Katanga and Northern Rhodesian mines will be in a position to export 400,000 to 500,000 tons of copper a year, or about a fourth of the present world consumption. One may well ask what such a plenitude of riches will do to the world market, already almost completely demoralized. But the history of the world in the last four centuries has been of just such problems. Columbus, with a new continent in his pocket, returned to extend immeasurably the borders of the ancient world. The riches of America were at first dazzling and then dangerous. So with the riches of Africa. There is far more there than the world now needs of precious metals, of tin, cobalt, uranium, iron, coal, gold, diamonds, and platinum. Our problem is one of adjustment and distribution.

The London Failure—and After

THE all but complete failure of the London seven-power conference has put the world back into an extremely critical situation. The statesmen of Europe are again gambling with its fate as they did in 1914. If they realize more clearly today than they did then the perils in sight, they are apparently almost as helpless to avoid the catastrophe. From this moment on everybody's attention must be fixed upon Germany and England. The chief question now is, Can Chancellor Brüning hold himself in power? And can the alarming withdrawals of gold be stopped which are threatening to put England into almost as critical a situation as that in which Germany found itself more than two weeks ago? Upon the answers to these questions depends everything. The Germans are obviously straining every nerve to make good their previous errors; they are profiting by the prestige of the visits to Berlin of Secretary Stimson, Ramsay MacDonald, and Arthur Henderson; they have established an "Acceptance and Guaranty Bank," in which the Reich will hold two-fifths of the total capital of \$47,500,000. This new institution will, it is hoped, not only hasten the stabilization of the domestic credit situation, but reinforce German credit abroad. Meanwhile, however, the condition in Berlin and the business and financial world continues chaotic. Checks by the thousands are piling up in the banks, factories are able to pay only half wages, and there is a complete disorganization of the ordinary transactions of the mercantile world. On top of that, the final bankruptcy of the great Bremen wool concern, which precipitated the failure of the Darmstädter and National Bank, has thrown 30,000 more persons out of employment. Rumors of a dictatorship in Berlin alternate with fears that it will not be possible much longer to keep the Hitlerites out of the government.

That the London seven-power conference was a failure everybody except Mr. Hoover can see. The President, however, exults over it, and with his familiar, but incredible naivete, not to say folly, announces once more that the end of the world crisis is now in sight. The seven-power conference had no other result than the announcement that the private bankers of the nation had consented to freeze their German credits—but these credits were already frozen, or would have had to be frozen in any case, since to call them would have completed the financial ruin of Germany. That could have been announced without any conference whatever, but Mr. Hoover is entitled to his joy if there was a psychological profit in announcing it at the end of the conference. But nothing can conceal the fact that Chancellor Brüning has returned to Berlin empty-handed. No long-term credit was extended, as was reported would be the case when *The Nation* went to press last week. And without a long-term credit it is hard to see how Berlin can be really saved. But the international bankers insist that with the Young Plan bonds selling at 56, it is impossible for them to offer new long-term securities issued for the relief of Germany, and that the only hope in that direction lies with the several governments. The latter reply, first, that there is no money in London; second, that our Congress would never consent

to any more loans to Europe; and, third, that the French, who have the money and could help, will not do so save on terms that no German Chancellor could accept and remain in office.

This may be perfectly sound; it does not alter the fact that the leaders of the world seem about as helpless to stave off disaster now as were the governments of 1914. In the thirteen days prior to July 26, \$145,500,000 in gold was lost by the Bank of England, \$68,000,000 in three days. A continuance of this run would speedily reduce the British gold reserve to the \$275,000,000 beyond which any further decrease would menace the currency and the whole stability of the British business world. That this will be permitted to come to pass we do not believe; we take it for granted that the American bankers will prevent such an outcome. The piling up of gold in Paris continues to evidence the nervousness of French investors and depositors, who have been engaging in an "almost frantic sale of sterling." The French situation has been marked by a slight decrease in unemployment, but the heavy decline of 10 per cent in railroad earnings continues. France's foreign trade shows a drop of 20 per cent for the first six months of 1931 as compared with the figures of 1930, imports falling off 13 per cent and exports 29 per cent, while the tremendous decrease in foreign visitors is also making itself felt. The Paris Bourse has reflected the disappointment as to London, and the substantial rise in the London bank rate to stop the drain of gold has resulted in the fall of every security listed in Paris, with trading extremely dull. Why under these circumstances the French government should continue its dog-in-the-manger policy and refuse to join whole-heartedly in relief to Germany, we cannot understand.

We are aware, of course, of the stock nonsense that the French government is "controlled by public opinion," and that all France still trembles in fear of Germany. We believe in neither contention. There is no public opinion in France save as it is reflected by the most corrupt and government-controlled daily press in the world; the people have no chance to make their opinions heard, and there is a growing minority who are bitterly opposed to the continuation of this French policy. Nor can we believe that the people would fail to respond if their so-called statesmen should now deliberately initiate a policy of good-will and understanding with the Germans, not, if you please, because they are Germans, but because the Reich happens to be the cornerstone of European economic health and of the existing social system. We confess that we find ourselves in accord with J. L. Garvin's editorial in the *Sunday Observer* that "all this misery and peril in Europe arise because Premier Laval's government and the Paris press assume that America and Britain are virtually powerless to take separate action. We are utterly convinced that this misapprehension will have to be removed before three months are out"—if Mr. Garvin is correct in believing that the existing situation can really continue for three months more without a catastrophe, which we very much doubt. Europe's statesmen, at best, have no time to lose.

If—

THIS is the day of taking stock of America with innumerable "if's." If we had a five-year or a ten-year plan for the development of our industrial life, how should we apportion it and upon what theory should we proceed? If we were frankly to abandon our laissez faire policy, what then? If we were to enter the League of Nations, how should our foreign policy be altered? The questions are innumerable; the "if's" flash by like the lights on an underground railroad. Well, we too have our "if's"—many of them. Just now we have been amusing ourselves by putting this question: What would the United States be doing now if, instead of our present Congressional system and a President with a fixed term, we had a parliamentary government with a Ministry responsible to the Parliament, and therefore to public opinion?

Now the first result would be that if Mr. Hoover were a responsible head of a Cabinet instead of a President immovable for four years, we should have an entirely different attitude in the White House. It is one thing to know that one is fixed for four years and quite a different thing if the end of one's headship of the government may come at any moment. In the first place, Mr. Hoover, or any other President, would be so bent on holding his job now that he could not have his eyes firmly glued on renomination in 1932. That even a Prime Minister like Ramsay MacDonald may spend much time planning—and compromising—to remain in office we could not deny. But Mr. MacDonald, thanks to a superior constitution and a civil service which is wholly outside of politics, is under no temptation to intrench his control of the government by manipulating or threatening public office-holders. It is barely possible today to find a highly placed Republican who privately desires the reelection of Mr. Hoover, but it is quite impossible to find one who does not feel that Mr. Hoover can renominate himself if he desires to do so. We admit that there are countries—as our foreign correspondence has shown of late—where, by barring one's opponents from the polls or terrorizing them into staying at home, it is possible for an incumbent Ministry to keep itself in power. But we are writing of countries presumably controlled by law and enlightened public opinion, of heads of governments who do not seek to keep themselves in office by extra-legal methods, or pure chicanery. In no other government of first rank save ours is it so readily possible for the head of the country to use its permanent civil service in order to further his own personal ambitions.

Aside from the Executive, the chief weakness of our system is the inability of public opinion to obtain results quickly and directly. The Congress elected in November last has not yet been seated; the President will not call it together, and unlike other parliaments it cannot call itself. The political scene has changed a great deal since that Congress was chosen. We are back in Europe and our national situation has grown more acute in various directions; the distress among certain of our people has grown apace. Even when Congress meets in December it will not be the Congress which would meet were its members to be

chosen this November instead of last. While its members will undoubtedly reflect the increased strain upon their respective communities, many of them would not be in a position to represent their neighbors at all if they were to run this fall. For the present Administration has grown increasingly unpopular; even in the theaters and music halls it is the butt of jests—bitter as well as good-humored.

If our Cabinet had seats on the floor of the Senate or House as a Ministry, its members could not escape a day-by-day questioning of their acts. They would have to go officially on record, for example, as to whether they do or do not agree with the attitude of the Red Cross in refusing to go to the aid of the starving miners because their plight is no act of God—we had thought that all events were the direct outcome of the acts of Divine Providence scourging or aiding us for our own good! The Cabinet would have to say whether it believed that the Kellogg Peace Pact meant something or was not worth the paper upon which it was written. Mr. Hoover, if he daily faced long rows of critics as does Ramsay MacDonald every legislative day in the year, would have to answer a host of questions, some to his discomfiture. Today even the White House press conferences are a waste of time and are practically abandoned. There is no one who can bring the President to book. Meanwhile, he can go on making certain his renomination at the next Republican convention—unless a political earthquake occurs—and if the Democrats are asinine as usual, he may count upon his reelection.

But such as the system is, under it we work along. The almost incredible long-suffering and the great sense of humor of the American people together keep things unchanged. We have now been for decades without the political urge, without political curiosity, and press and public alike have lost their critical faculty—a faculty extremely keen in the days of Grover Cleveland and of Benjamin Harrison, of William McKinley and of William H. Taft. The question that will answer itself in the coming months is whether the suffering which the public is undergoing is sufficient to reawaken the spirit of revolt, which ought always to be latent in the American breast. It was Thomas Jefferson who felt that there should be a little blood-spilling every twenty-five years, so that the people in control of our government might remember who were the real masters of America. We do not look for blood-spilling, heaven knows; it would be a sorry day, indeed, for Mr. Hoover and all the rest of us if it should become necessary for the troops and the police to do as much shooting as they did in 1877. All of which, however, does not keep us from asking ourselves questions. We are in the same boat with the rest of our fellow-citizens; we shall all be asking more and more questions as to the why's and wherefore's and the if's, as the months that lie before us come and go. Only one thing is clear—we live in the most stirring and thrilling of times. He must be dull, indeed, who is not at least dimly aware that this old globe is turning at a faster rate than ever before, and that the womb of fate is bigger than ever with the destiny to come.

A Coal Crisis Again

A GAIN we are faced with a crisis in the soft-coal industry. Once more we find a Washington Administration, professedly anxious to deal with the question, but moving with painstaking caution. Already rebuffed by a majority of the bituminous operators, Secretaries Doak and Lamont, upon the insistence of President John L. Lewis of the United Mine Workers, have renewed their invitation to the operators to confer with government officials and labor representatives in Washington. "It is our desire," wrote Messrs. Doak and Lamont, "to assist in any workable and practical plan which might offer to contribute substantially to a solution of the difficulties in the coal industry." This sounds strangely familiar.

In 1919, when the bituminous miners struck, the whole weight of the government was thrown against them, but in 1922, when a similar crisis developed, President Harding expressed a desire to help find a solution. Secretary of Commerce Hoover took the initiative in bringing operators and miners to Washington for a series of conferences. We were at that time promised a solution. But nothing happened. Not long before the elections of 1924 another strike was threatened, and this time it was the turn of the Coolidge Administration to act. "The impending battle would have been staged in the spring of 1924," said Colston E. Warne in *The Nation* for April 4, 1928, "had not the Republicans thought it best to pacify the miners until after election. Under political pressure, an armistice—the Jacksonville agreement—was signed to preserve peace until April 1, 1927." The agreement was widely repudiated, particularly in the northern fields. W. G. Warden, chairman of the board of the Pittsburgh Coal Company, told a Senate committee early in 1928 that he had never even read the agreement, but nevertheless had felt free to break it without a moral qualm. The Senate was at that time inquiring into conditions in the coal industry, and President Coolidge hinted broadly of the need for definite action. But to no end. The industry was allowed to drift through the strikes of 1928 and 1929, so that today it is worse off than ever before.

Again the government is going about the matter in a haphazard way. It appears reluctant to use pressure against the operators, and it pretends that President Lewis and the United Mine Workers are competent to speak for labor notwithstanding that their influence has rapidly been waning of late years. The U.M.W.A. has been all but displaced by the National Miners' Union in western Pennsylvania and eastern Ohio; it has had to give way to Frank Keeney's new union in West Virginia; it is losing against the invasion of the Industrial Workers of the World in Kentucky; and it is still a serious question whether the U.M.W.A. or Alexander Howat and his followers are to control the Illinois-Indiana district. Do Secretaries Doak and Lamont really believe that they can arrive at a satisfactory and lasting solution without giving these organizations a voice in the matter? Or are the Republicans once more merely seeking a temporary and meaningless agreement with the reactionary Lewis organization to tide them over the difficult months between now and the 1932 election?

Mr. Shaw and Russia

WHEN Bernard Shaw visits Soviet Russia, as he is now doing, the world is entertained by the spectacle of irresistible force meeting—irresistible force. Russia is the bad boy of nations, and Mr. Shaw, in spite of the benignity of his white hairs and his three-quarters of a century, is still the bad boy of the articulate world. For upwards of fifty years he has been engaged in the delightful occupation of giving the world a piece of his mind; since its birth in 1917 Soviet Russia through its foreign office and its press has done likewise. It is no wonder that many worthy persons were made uncomfortable by the painful plain-speaking of Mr. Shaw. And it is perfectly understandable that the other European nations should have quivered before the verbal assaults of the Soviets. When Mr. Litvinov was, on suffrance and as evidence of everybody's extreme generosity, invited to a disarmament conference he actually had the temerity to propose that the nations, led by Russia, disarm. Naturally enough, this proposal got the reception it deserved. To propose disarmament at a disarmament conference plainly implied gross insincerity, but fortunately one did not have to pay any attention to it. However, more than one worthy delegate must have murmured to himself, it was just what might have been expected from a godless country like Soviet Russia.

There is, for the Soviets, one aspect of the situation that should offer consolation—although so far they have not seemed in need of it. For here is Mr. Shaw, all respectable and honored and white-haired and seventy-five. Those who might have been his critics two or three decades ago are either resting with the grass roots or turned into his ardent admirers. He is the bad boy who dares to thumb his nose at the world; but in addition, he is the prince of authors, the best intellect of his time, a dramatist of the first water in a nation of first-water dramatists. Ask any man in the street if this be not so.

Who can say that it will not be the same with Soviet Russia? In fifty years, when ten five-year plans have tumbled along after one another, when soviet factories are running smoothly, when collectivized agriculture turns out twenty-cent wheat, when the whiskers of the horrendous Bolshevik government have turned a dignified white, the world may perhaps have learned to admire, perhaps even to emulate. We have done a good deal toward catching up with Mr. Shaw. When his play "Getting Married" was presented in New York last winter it was received with respect tempered with boredom. "Old stuff," the audience said. But when it first appeared a score of years ago it was so startlingly fresh as to make aged gentlemen and maiden ladies shudder with horror. One has only to remember the thrill that went through a London audience, at the first performance of "Pygmalion," at Eliza's dreadful, dreadful word. That word, one hears, has become a commonplace of genteel English dinner tables. It is not quite impossible that in time nursery tales will go somewhat like this: "And the nice Bolshevik gentleman, with the long, long, white beard, stepped up to the horrid old capitalist and said: 'You get out of here.' And he did." Words used to frighten children sometimes become words to soothe them to sleep.

Thunder in the Wheat Belt

By W. G. CLUGSTON

Topeka, Kansas, July 24

IT is difficult to put into words a description of the disaster which has come to the American farmer with twenty-five-cent wheat prices. It is difficult to describe what has been done to the farmer economically, and in hope, spirit, and morale; it would be dire folly to try to predict what the farmer, in his despair and desperate straits, may try to do to the political and economic structure of the nation if conditions do not improve before he comes out of his dazed confusion and begins to fight for the existence of himself and his family.

I do not want to appear radical, or an alarmist, but I am firmly convinced that there is today in the Middle West a menace to the existing order which is becoming more threatening than anything that has been known since the founding of the Republic. The producers who supply the food upon which the nation lives are facing worse than bankruptcy and the loss of their lands; many of them are actually facing a winter in which they will not be able to provide their families with food or fuel unless they are aided by the government or some form of charity. In the winter-wheat-producing areas the situation is more fraught with danger because it has come at a time when the farmers, with nature's aid, have produced more bounteous crops than ever before—because, as Governor Woodring of Kansas has said, "we are going through a panic in the midst of plenty."

The farmer who is compelled to sell his wheat for twenty-five cents a bushel, and his oats for twelve cents a bushel, has two ways of looking at his calamity, both of which are calculated to make him "see red." When he disposes of his wheat and goes to make purchases he naturally makes comparisons such as these: For the price of a bushel of sixty-pound wheat he cannot buy at a bakery three ten-cent loaves of bread. It takes approximately five bushels of wheat to buy enough standard-grade gasoline, with the State gasoline tax added, to make a hundred-mile trip in an automobile. A bushel of wheat will buy just one round of five-cent ice-cream cones for a family of five; if a farmer uses tobacco and chews one thick plug of Drummond a day (as many industrious chewers can do), it will take almost a bushel of wheat a day to keep him in chewing tobacco; if he smokes cigarettes and chews gum, a bushel of wheat will buy just one package of cigarettes and one package of gum. It will take 16 bushels of wheat (more than the average yield of a whole acre) to buy his wife or one of the children a pair of \$4 shoes, and 120 bushels to buy a \$30 suit of clothes.

Similar comparisons can be made as to the purchasing power of other farm products. The local Abilene, Kansas, produce market on the day this is written shows that a farmer's wife can hardly buy three spools of thread with the money received from the sale of a dozen eggs; a two-pound spring frier will not bring in enough money for her to buy a thirty-cent pair of cotton hose; it takes the proceeds of more than twenty-five pounds of butter fat to purchase a five-dollar hat.

Startling as these comparisons may seem, they do not begin to depict the seriousness of the situation the farmer has to face. They are only invidious comparisons. The real situation is that when a farmer sells a bushel of wheat for twenty-five cents he has absolutely nothing with which to buy a package of cigarettes, a plug of tobacco, or even a stick of gum, to say nothing of hats, shoes, or other articles of clothing for his family, for the simple reason that it has cost the best and most industrious of average farmers more to produce the bushel of wheat than he gets out of it—in many cases the cost is nearly twice as much, even in the big wheat-producing sections.

This means that the farmer has no money with which to pay his taxes, meet his current obligations, or pay the interest on the farm mortgage. What then will he do for food and clothing, and schoolbooks for the children, and medicines and doctor bills, until another crop is harvested? This question brings up the seriousness of the situation as it affects other individuals and industries in the agricultural sections. Beyond a doubt there is no one in the big winter-wheat belt who is not facing difficulties as a result of the farmer's plight. Banks must carry notes and mortgages on which they can collect nothing, and in financial circles it is admitted that some of the weaker banks probably will be unable to stand the strain. Grocers, clothing dealers, implement dealers, and all other merchants, especially automobile and radio dealers, are feeling the pinch and beginning to worry about survival. Even the doctors and undertakers are finding collections so slow that they are facing financial embarrassments.

The question of who or what is to blame for the distressing condition is, naturally, a controversial one which has no place in this article. But the farmers' ideas about where the blame should be placed should be of interest. It may surprise the Republican politicians to learn that many go back to the enactment of the Smoot-Hawley tariff bill as the beginning of their trouble—they believe that through the raising of import barriers other countries were brought or forced to similar procedures, with the result that international trade was curtailed and thus the world market for American grain was destroyed. Today there are probably more farmers who blame the high tariff for their hard luck than there are farmers who blame Russia, despite the fact that Russian competition has been played up as an important factor by supporters of the high-tariff atrocity.

If it is no surprise to the Republican leaders to know that the blame generally is laid at the doors of President Hoover and the Federal Farm Board, then it must, at least, be very painful for them to behold the flood of complaints that constantly pours into Washington. At present it is a question whether President Hoover or his Farm Board is more generally condemned by the farmers. The board, almost without exception, is being condemned for its refusal to agree to hold off the market its surplus from last year's crop in order to give the distressed farmers a chance to market their new crop. But in almost every farmer gather-

ing the feeling is expressed that President Hoover is responsible for the Farm Board and that he must bear the blame when the board refuses to take any action. The European debt moratorium move has made many farmers more bitter toward Hoover because they feel he should have come to the aid of the American farmer in his crisis before going over to Europe to aid Europeans who are in distress. A public demonstration of this feeling was presented in Topeka, the capital of Kansas, last week when a dilapidated Ford touring car of obsolete model appeared on the streets with two men in it and a large sign painted across it which read: "We're just a couple of Hoover tourists going to the aid of Germany."

Another demonstration of the anti-Hoover feeling was given in a college-celebration parade at Hays, Kansas, in which there was a float loaded with men dressed as hobos, with a sign across the side of the float which proclaimed: "We are Hooverized." Many jibes are taken at Hoover, such as, "There is no doubt about our President being the world's greatest engineer—in a little more than two years he has ditched and almost drained the whole country."

Republican and Democratic leaders alike are showing alarm because they do not know how soon the farmers may start a revolt, or to what extent they may go if a revolt gets under way. In Kansas the situation has many elements of seriousness for the leaders of Sunflower puritanism. Dr. J. R. Brinkley, a goat-gland rejuvenating medico of Milford, who polled 183,000 votes as an independent candidate for governor in the last election without even having his name printed on the ballots, is threatening to run as an independent candidate again, and is out campaigning the State in an airplane, criticizing both the Republican national administration and the Democratic State administration. More alarming still, E. Haldeman-Julius of Girard, a former Socialist, an avowed atheist, and an open champion of companionate marriage, has announced himself as a candidate for the old Curtis seat in the United States Senate, apparently as a Republican. I have talked with conservative Republican leaders, and with farm leaders, who have told me that if conditions do not improve before the next election Haldeman-Julius may become a real factor despite the general Kansas repugnance to his views on religion, marriage, and economic questions.

The economic seriousness of the situation is occupying the attention of business men in the towns as well as worrying the farm leaders. There is uneasiness because "Coin" Harvey's new plea for a monetary revolution is getting some attention, and because A. C. Townley, who organized the Nonpartisan League in North Dakota, is now following the harvest up from Oklahoma and advocating Harvey's theories.

In Oklahoma, Kansas, and Nebraska movements are under way to have moratoriums declared for the farmers to enable them to survive and hold possession of their farms. Banks have been appealed to to carry the farmers' paper; implement dealers have been asked not to press for payments due on machinery; and there is no doubt there will be agitation for tax-payment suspensions in some localities when tax-paying time comes. Adding to the alarm are such instances as the occurrence at Henryetta, Oklahoma, on July 18, when 150 farmers and jobless town workers marched on business houses and demanded money with which to buy food. If such a thing can happen in the "bread-

basket belt of America" when fruits are ripe on the trees and berries on the bushes, when vegetables are green in gardens, and when the grain harvest is in progress—if such things can happen at such a time, what may be expected when the bleak, cold days of winter arrive? Believing a lot of things are liable to happen, Governor Murray of Oklahoma has called upon every city and hamlet in his State to hold mass-meetings on July 27 "as a preliminary step toward organizing a State-wide unemployed relief program for next winter." In communities where there is such a bounteous overproduction of food supplies that grain is being piled on the ground out under open skies—in such communities charity must be resorted to if countless families are not to suffer in hunger! Can such conditions continue for long in a country such as America?

The impression should not be given, however, that gloom is universal in that it is everywhere—or that hope has entirely succumbed to despair. The farmers have not yet gone into revolt; few even have gone into displays of ugly moods either in the cities or the rural communities. A farmer in one western Kansas town who was offered only sixty-six cents a bushel when he drove to an elevator with a load of wheat became so enraged he pulled the tail-gate out of his wagon and drove home, spilling the wheat along the street as he went. There have been a few reports of tenant farmers who have refused to harvest their grain, and occasional reports of landowners plowing under the grain when it was ready for harvest. But for the most part the farmers have gathered the grain with as much industry as usual, and they are holding on to it wherever possible in the hope that prices will soon be higher.

Thousands of farmers are wasting no time in grumbling but are "digging in" for the long, hard siege they see ahead. They are economizing and cutting expenses in every way possible; many will let their land lie fallow for a year, which means there will be a big acreage curtailment this fall. This, in turn, and in time, may help boost prices. It surely should if the Canadian crop turns out as short as indicated, and if Australia and the Argentine reduce their acreages in accordance with announcements. Then, too, settlement of the financial troubles of Central Europe may bring more benefits than most farmers anticipate, and it is entirely possible that the Hoover Farm Board may finally hear the pathetic appeals which are resounding across the plains. The one thing above all others which is sustaining hope is the general belief throughout the country and in the towns that conditions cannot get much worse—that under every law of averages whatever changes the future brings must be changes for the better. If this should not be true there'll be hell to pay—hell to pay with two-bit wheat.

Gulls

By WITTER BYNNER

Have you ever seen a gull with a hurt foot
And the others pecking it, toppling it,
avoiding it?

Have you ever seen gulls, the long, calculating
slant, the swoop, the strut,
the seizure, the laughter—

And then the lone one?

President Hoover's Record

VII. Hoover and Power*

By AMOS PINCHOT

I

EVERY aspiring politician knows that barring a great national issue or some accident such as happened in the cases of Theodore Roosevelt and Woodrow Wilson, he can never land in the White House unless, so to speak, shoved from behind by at least one strong industrial-financial interest. For the man who sets his cap for the Presidency, the strategy, therefore, is predetermined. It is to win the backing of the best-organized and, politically speaking, most aggressive big-business group available.

Curtained off from the somewhat shoddy, inconsequential, but relatively open game we call politics, there goes on forever a game of another sort which, luckily for his peace of mind, the sovereign citizen is rarely allowed to glimpse—much less to sit in on. It is here, in the invisible game of grand politics, that things really happen. Here Presidents are chosen. Here history is made—also money in exceedingly large quantities. And as a means to these high ends, small men with large ambitions are transformed by the magic of propaganda into perfectly serviceable demigods, later, when occasion arises, to be flipped into office to the shouts of the happy multitude.

Few incidents in this game of American grand politics are more interesting, or I think more significant when viewed in retrospect, than the campaign in favor of the public-utility interests, and especially the power and light companies, that was waged by Mr. Hoover from 1924 to 1928, when, as Secretary of Commerce, he was already a candidate for the Presidential nomination.

Up to a few years ago the federal government played a comparatively small part in regulating public utilities. The State commissions took almost entire charge of them and State regulation was highly satisfactory, in fact, almost ideal from the point of view of the power companies, since in most States it amounted, as it does today, to no regulation whatever. As Professor John H. Gray, late rate expert of the Interstate Commerce Commission, points out, under State regulation the utilities charge, in practically every case, as much as the traffic will bear. "It is literally true," says Professor Gray, "that the public utilities have no regulation at all." And as a result the consumers pay extortionate rates not even remotely related to what the service is worth.

In a speech at the World Power Congress last July, which Mr. Insull vainly tried to have kept out of the newspapers, Frederick M. Sackett, American Ambassador to Germany and former president of the Louisville Electric Company, epitomized the position of the utilities: "I know of no other manufacturing industry where the sale price of the product to the great mass of the consumers is fifteen times the actual cost of production of the article sold." Current at the station is produced at from three-tenths to four-tenths of a cent per kilowatt hour. Making every allowance for

transmission costs, the average of six cents per kilowatt hour paid by the American consumer for household service is simply a racket price—a price accurately reflected in the financial history of the companies, which, despite the vagaries of cream-skimming banker direction, has been one of astounding prosperity.

Into this paradise of high prices there entered in 1920 a serpent in the form of the Federal Power Act, passed through the efforts of a group of liberals, in and out of Congress, after a bitter struggle with the power people extending over fifteen years. The Federal Power Act, as the reader is probably aware, sets up a Federal Power Commission, with jurisdiction over all power developments within federal lands or on navigable streams, whether running through federal lands or not. It provides that licenses to operate private plants shall be limited to fifty years. It instructs the Federal Power Commission to ascertain the actual net investment of the utility companies—a provision highly objectionable to the utility interests, which are in the habit of "writing up" their investment accounts, for rate-making purposes, to several times the actual amount spent. It provides for recapture by the government at the end of the license period, and for the setting aside of an amortization fund out of excess profits. It also provides that if a city or State should decide to construct its own power plant, it shall have a prior claim to the power site.

While the Federal Power Commission leaves the business of fixing rates to the State commissions, its examination into the net investment acts as a check on the State commissions and courts, which, under the thumb of the utilities people, have heretofore allowed the companies to use the book value of their properties as rate bases. And these book values are almost always grossly padded. Out of many cases disclosed by the commission the following are fair examples:

CAROLINA LIGHT AND POWER COMPANY

Book value	\$23,810,500.00
Actual investment	4,710,021.77

Total write-up \$19,100,478.23 or 405 per cent

In six companies acquired by the American Power and Light Company the commission summarized the write-ups as follows:

Book value	\$123,725,358.16
Actual investment	55,284,426.40

Total write-up \$68,440,931.76 or 124 per cent

Inter alia, the Federal Trade Commission reports write-ups in five subsidiaries of the Electric Bond and Share Company amounting to over three hundred millions.

By passing the Federal Power Act Congress effectively hung over the inflated rate bases and extortionate profits of the utility companies a sword of Damocles. But the sword

* Seventh of a series on President Hoover's record. The eighth in the series, being the second part of Mr. Pinchot's article on Hoover and Power, will appear next week.—EDITOR THE NATION.

did not fall until the Boulder Dam and Muscle Shoals controversies arose and the Federal Trade Commission, spurred by the Walsh resolution providing for a Senatorial inquiry, began its investigation of the power trust. In the meantime, the utility interests, foreseeing this dangerous situation, had started a nation-wide backfire against interference by the federal government. Their program was simplicity itself. Federal regulation must be discredited at all costs; regulation by the State utility commissions must be pictured as an adequate protection for the consumer; and, finally, public ownership and operation must be painted as an unsound experiment, highly prejudicial to self-government.

It is precisely at this juncture that, with all the prestige of his office and high reputation as an engineer, the Secretary of Commerce appears on the scene as champion and propagandist of the utility interests. In a series of articles and speeches delivered before conventions of utility companies and State public-service commissioners, Mr. Hoover painstakingly builds the myths (a) of the big-hearted utility magnates, filled with the spirit of service, and (b) of the socially minded State commissioners, whom he portrays as little less than a consistory of saints. These speeches and writings were promptly printed and distributed by the utility people in immense quantities.

Exhibit Number 65 of the Federal Trade Commission's investigation is a list of orders for pamphlets placed from 1924 to 1927 by the Department of Public Information of the National Electric Light Association, the propaganda agency of the utility companies. Glancing down its seven pages, we note that the pamphlets are by such writers as Bruce Barton, Owen D. Young, Merlin Aylesworth, Andrew Mellon, Samuel Insull, Martin J. Insull, and Mrs. John D. Sherman, president of the National Federation of Women's Clubs. There are also a few small orders for reprints of speeches critical of the utilities, apparently distributed to members of the National Electric Light Association as suggesting the need for refutation. With the exception of Mr. Barton's brief messages to customers, none of the pamphleteers approach Mr. Hoover in respect to the number of pamphlets ordered. Here are some of the entries:

June, 1924	Convention Addresses	
	Herbert Hoover	Large... 10,000
		Small... 5,000
June 25		Small... 50,000
July 3		Small... 50,000
July 22		Large... 10,000
October, 1924	Herbert Hoover, Government Ownership	500,000
July, 1925	Herbert Hoover, State vs. Federal Regulation of the Power Industry (printed by Department of Commerce, Washington, D. C.)	50,000
October, 1925	Why the Public Interest Requires State Rather than Federal Regulation of Electric Public Utilities, by Honorable Herbert Hoover before the National Association of Railroad and Utilities Commissioners, October 14, 1925 (printed by Department of Commerce, Washington, D. C.)	50,000
November, 1925	Ditto	25,000

Meantime, the Joint Committee, the Washington lobby organized by the utilities people to fight the Boulder Dam and Muscle Shoals bills, is also pamphletting the Hoover speeches. And Mr. Insull, in his report to the Public Policy Committee, Forty-ninth Annual Convention of the National Electric Light Association, May, 1926, says: "In a recent article on 'State Utility Control, the Only Way,' however, the Secretary of Commerce has stated the status of these problems in a most masterly manner, and your committee felt it could not do better than to make the following extracts from Mr. Herbert Hoover's article a part of this report." The article referred to is a solemn warning against federal interference and a panegyric of State regulation, under which Mr. Hoover declares that the rates charged for electricity have been just and moderate, while the interest and dividends paid by the companies have "never yet exceeded 6 per cent upon the values of all the properties for rate-making purposes." The State commission, he adds, should receive credit "for these conditions—their regulation has been effective."

During this entire period Mr. Hoover's writings and speeches abound with praise for the leaders of the utility industry, and he congratulates America on the fact that "the new generation of administrators of these enterprises has firmly grasped its responsibility to the public." He insists that "there has been a genuine growth of business conscience and service, and this growth is far more precious than any amount of legislation." The reprint of this speech, by the way, is still being given out by the Joint Committee from the Graybar Building in New York. Mr. Hoover also says that the utility people are no longer in financial control of the utilities. On the contrary, it is his opinion that they are controlled by the public itself. Under State regulation, he points out, the earnings of the utility companies have been held down to "between 6 and 8 per cent upon their invested capital." A somewhat remarkable statement, for Mr. Hoover could hardly have been unaware that at that time there was no comprehensive source of information as to the capital invested in utilities, except the companies' own figures. And these, as our Great Engineer should have known, were boosted—both for rate-making and stock-jobbing purposes—until they had become, as Professor Gray says, "higher than any capitalization they ever dared to water."

In June, 1925, Mr. Hoover appeared as principal speaker before the San Francisco convention of the National Electric Light Association. In his address, pamphletted by the Joint Committee, he again expresses his admiration for State regulation. He has, it seems, made an investigation of the State public-service commissions and he finds that "with very little criticism they are proving themselves fully adequate to control the situation." They are, in fact, "doing their jobs well." He sees no reason for the imposition of "a superior regulation. . . . Nothing could be a more hideous extension of centralization in the federal government than thus to undermine the State utility commissions and State responsibilities." He regards the men at the head of the utility companies as belonging "to a new school of public understanding as to the responsibilities of big business to the people."

In this particular speech, however (at San Francisco, June, 1925), Mr. Hoover makes one grave tactical error. By emphasizing the interstate character of electric power he, by inference, justifies regulation by the federal government:

The wider interconnection between these regional systems is also proceeding apace. For this again makes use of the power capacity below the peak load by an interstate diversification. Such a flow of electricity will soon be traceable through the many regional systems continuously from Montana west to the Pacific, thence south to Mexico—a total of 1,800 miles. Shortly, power tie-ins will be completed in the Middle West and Southeastern areas, coursing all the way from Wisconsin and Michigan around through West Virginia and North Carolina to Arkansas and Louisiana.

Such an utterance, though strictly in accordance with the facts, was from the point of view of the power people far from politic. It would not do at all to have our Secretary of Commerce running about the country telling the public that electric power was, in effect, a commodity of interstate commerce. So, having accepted an invitation to speak at Washington, D. C., before the convention of the National Association of Railroad and Utility Commissioners four months later, Mr. Hoover accommodately reverses himself:

The argument is sometimes used that the power situation is parallel with the railroads, where federal regulation has been found absolutely necessary. This is an illusion. It differs in several profound respects. Power has no such interstate implication as transportation. . . . *Furthermore, there has been outrageous exaggeration of the probable extent of interstate power. For economic reasons these power districts will in but few cases reach across State lines.*

Mr. Hoover is always at his best when dealing with technical subjects. The deadly accuracy with which his mind works is more clearly seen if we join the two foregoing utterances and read them as one:

The wider interconnection between these regional systems is also proceeding apace. . . . Such a flow of electricity will soon be traceable through the many regional systems continuously from Montana west to the Pacific, thence south to Mexico—a total of 1,800 miles. Shortly, power tie-ins will be completed in the Middle West and Southeastern areas, coursing all the way from Wisconsin and Michigan around through West Virginia and North Carolina to Arkansas and Louisiana. . . . Furthermore, there has been outrageous exaggeration of the probable extent of interstate power. For economic reasons these power districts will in but few cases reach across State lines.

Apparently between June and October a little bird has whispered a sweet something into the Hooverian ear. It must be remembered that the National Electric Light Association is, politically, an exceedingly potent body. Mr. Owen D. Young acts as a sort of chief justice of its Public Policy Committee, which represents practically all the utility interests and the great banking and insurance interests behind them.

In both the San Francisco and the Washington speeches Mr. Hoover points with pride to State regulation. It has brought "an assurance of justice and protection to our citizens." There is "no surer method of sapping the foundations of self-government" than to weaken the State commissions and extend federal control over the utility companies "which so vitally touch the life of every family, every industry, every community."

In 1925 the Joint Committee lobby in Washington is-

sued a booklet entitled "Government—Federal, State, Local—Fails in Industry." On the title page are quotations from Abraham Lincoln and Herbert Hoover, an indication that the utilities people are now casting soft glances at our Secretary of Commerce, as having earned the right to be viewed as Presidential timber. The booklet contains an anthology, "Great Minds Speak," the great minds including, besides Mr. Hoover, Simeon Fess, Jim Watson, John Spargo, Calvin Coolidge, and others. Here again Mr. Hoover drives home his State-regulation doctrine and, as proving that federal regulation threatens the home and the fireside, says:

I have said in another connection that, after all, the object of our whole social and economic system is the family and the home with its independence, its freedom, and its comfort, and if we are to set up more systems of alien regulation and bureaucratic domination, we shall inevitably undermine all of these treasured essentials of life.

In 1926 Mr. Hoover goes on hammering federal regulation. Electric transmission, he says, should be controlled by the individual States and not by the federal government. In his Seattle address, however, the conservationists having gone after him pretty hard for his attitude on State control, and the West having been aroused by the Boulder Dam situation, he makes the concession that where a power site is to be used for power only (that is, not for flood control or irrigation) it should be leased under the provisions of the Federal Power Act. As we shall see, after his election he goes back on this by trying to break down the Federal Power Act and attacking its constitutionality.

In 1927, as Presidential nominations approach, Mr. Hoover becomes reticent, not to say mysterious. He says that the development of water power on the St. Lawrence should be undertaken by "appropriate agencies." But he refuses to say whether the agencies should be private or public. The *New York Times* comments thus on his statement of January 27 as to the Colorado flood-control and water-supply project: "Neither the Boulder Dam bill nor any other specific measure was mentioned by Mr. Hoover."

In the meantime two significant events have taken place. Mr. Hoover's power secretary in the Department of Commerce was Paul S. Clapp. His solicitor was Judge Stephen B. Davis. These two were Mr. Hoover's main aides on power questions. In behalf of the government Judge Davis had charge of the Boulder Dam controversy.

At a utility convention held in Chicago on October 13, 1927, Philip H. Gadsden, vice-chairman of the Joint Committee, vice-president of the United Gas Improvement Company of Philadelphia, and president of the Philadelphia Chamber of Commerce, reported that at the suggestion of Mr. Hoover Judge Davis would be released from the Department of Commerce to become the director of the Joint Committee (the lobby formed, as we have stated, to oppose the Boulder Dam and the Muscle Shoals bills). Davis's employment by the Joint Committee began on June 1, 1927, at a salary of \$30,000 a year.

Meantime, what became of Mr. Clapp? He also was released by Mr. Hoover, but to become managing director of the National Electric Light Association. So, before Mr. Hoover left office, he had seen to it that the two authorities in the Department of Commerce next in command to himself in that conflict that allegedly goes on between the government and the power people were installed, one as head

of the power lobby, and the other as leader of its propaganda forces.

Here it might also be noted that William H. Murray, to whom in 1923 Mr. Hoover gave the job of conducting the government survey of superpower, was the same Mr. Murray whom the National Electric Light Association had employed in 1921 to make a report on the Ontario publicly owned hydroelectric system. The Murray report brought from Sir Adam Beck, chairman of the Ontario Hydroelectric Commission, the comment:

Mr. Murray has made grossly incorrect and misleading statements; he has garbled documentary and other data and then employed them as premises from which to derive conclusions. . . . In a word, Mr. Murray has employed methods demonstrably reprehensible and unprofessional.

Mr. Hoover entered the Republican Convention of 1928 with the "new generation of administrators" pulling for him like wheel horses. He won the nomination practically unopposed. In the campaign itself Mr. Hoover's utterances remained sibylline. In his acceptance speech in August, 1928, at Stanford University, he avoided the dangerous subject of power, announcing, however, that he would later discuss a number of questions "of the first order." But thereafter his nearest approach to the power question was in his speech at Elizabethton, Tennessee, on October 6, 1928, when he said:

I do not favor any general extension of the federal government into the operation of business in competition with its citizens. . . . There are local instances where the government must enter the business field as a by-product of some great major purpose such as improvement in navigation, flood control, scientific research, or national de-

fense, but they do not vitiate the general policy to which we should adhere.

A Scripps-Howard editor thereupon asked Mr. Hoover if he referred to Muscle Shoals. And he replied, "You may say that means Muscle Shoals." This was wired to the Scripps-Howard circuit, and on October 8 the story was carried under the headline, "Hoover Wants Government to Operate Muscle Shoals." Instantly a tense situation was precipitated. But this didn't last long. For by six o'clock of the same day the candidate gave out another statement, declaring that the power generated at Muscle Shoals "should be disposed of on such terms and conditions as will safeguard and protect all public interests."

Shortly after Mr. Hoover's election, that is, on November 17, 1928, the *Electrical World*, whose senior editor, W. H. Onken, Jr., was at that time chairman of the Prize Awards Committee of the National Electric Light Association, commented editorially as follows:

Election over, the stock market has reflected by sharp advances in public-utility stocks a sentiment prevailing among utility executives as well as in banking circles that Mr. Hoover's triumph in the national election augurs well for the electric public-utility companies. It is a tribute to the industry to get such an indorsement, even though it be indirect; but the only assurance the utilities are justified in holding firmly is that any Congressional legislation affecting them will be accepted or rejected by a President possessing toward utility problems a wise and an understanding heart. Any other interpretation of the election is unwarranted.

In my next article I shall discuss Mr. Hoover's power record as President.

What I Believe*

By MORRIS R. COHEN

IN the pride of youth I used to characterize myself as philosophically a stray dog, unchained to any metaphysical kennel. It seemed to me better to brave the muddy realities of the unprotected out-of-doors, the uncertain food, the attacks from the watch-dogs of comfortable homes, and above all the chilling rains and winds of factual experience. For the roving way led through bracing airs over green hills to broad sunny plains and sparkling rivers flowing to distant seas. But as I approach the years of post-rheumatic wisdom, I am beginning to find increasing refuge in the great palaces and parks of the classical philosophies.

I no longer despise those who, like our great poet-philosopher Santayana, set up a wall around their garden to shut off the disconsolate hills and the monotonous sea as well as the smoke and din of the market place. After all, no matter how small our plot of ground, we always have with us the fundamental elements—earth, air, sky, and rain. To the enterprising mind, the mystery of creation is as profound and as challenging here as elsewhere. The sun and stars, and the alternations of bright days and dark nights persist

through the changes of cosmic weather. And the human scene, likewise, offers the same elements of hunger and love, pride and foolishness, joy and suffering, throughout diverse ages and climes. I have thus learned to see virtue in the stably organized as well as in the wild or untamed intellectual life. Nevertheless, I have never become completely at home in even the greatest of academic philosophies. I can never forget that there is a world outside of their boundaries, and their guards look askance at me because I never completely get rid of the out-of-door mud.

The central fact to which, it seems to me, prevailing creeds refuse to accord sufficiently serious attention is the obvious impossibility of attaining omniscience. Endowed as we are at birth with infinite ignorance, no amount of knowledge which we acquire in our finite existence can completely exhaust all the complex and temporally endless realms of being. This of course does not justify the absolute denial of all knowledge. No skeptic believes his own opinions to be as baseless as those of his opponent. To recognize ignorance, we must know something. But simple honesty requires us to admit that none of our creeds are entirely free from guesswork. This lack of omniscience is not cured by reliance on faith, intuition, or authority. For however cer-

* The third of a series of articles on this subject by well-known men and women. A fourth will appear in an early issue.—EDITOR THE NATION.

tain we may *feel*, we never *know* that such faith, intuition, or authority will not in the end prove itself mistaken. Faith may influence the conduct resulting from our beliefs, but it cannot change the character of our ancestry or of the events which have already happened, and no one really believes that faith will enable him to escape death and other incidents of our common fate. Nor does the practical necessity of acting on our beliefs make them true. The misery of mankind testifies to our many poignantly unsolved problems.

To the inadequacy of our knowledge must be added the tremendous force of temporarily pleasant illusions, compared to which the love of truth is pitifully frail. Indeed, we may regard the attraction which illusion has for us as similar to that which a flame at night has for a moth. The sources of illusion are many: inherited forms of expression, fashions in respectable or approved opinions, the idols of our tribe or clique, of the market place, of our professional conventions, and the like. But the greatest of all is that vanity which is rooted in our very existence as individuals and which makes each one of us view himself as *the* privileged center of the universe. Is not the zenith directly over *my* head? And is not everyone else and everyone else's point of view only a part of *my* wider world?

In our daily life this shows itself in our self-centeredness, in our inability to do justice to others or realize that they have feelings and rights like our own. We cannot fully see the interests of others because we identify our own with those of humanity or of eternal righteousness. Thus the working classes speak of themselves as the people, the middle classes as the public, and the upper classes as the country. In philosophy this fatal vanity shows itself in anthropomorphism, in making man the central aim or goal of the whole cosmic process—though no one disputes the evidence of astronomy and geology that the life of the human species is but an episode in the history of the cosmically tiny bit of dust, our earth, which has had a beginning and is therefore bound to have an end.

From this point of view the great line of division is not entirely between ancient religion and modern science. Fundamentalists, liberals, moralists, and "scientific" evolutionists are at one in pretending to have plumbed the depths of the universe and to have found that it is all planned in a quasi-human way for our "uplift." On the other hand great religious teachers, like the morally wise men of science, have taught the great lesson of humility—that there are always vast realms beyond our ken or control, and that the great blessing of inner peace is unattainable without a sense of the mystery of creation about us and a wisely cultivated resignation to our mortal but inevitable limitations. The necessary effort to understand and control external nature does not require the silly pretension that we can become the omniscient and omnipotent rulers of the universe.

The worst offenders in this respect are, indeed, those physicists and biologists who, in trying to reconcile science with the vague sentimentality which they call religion, abandon altogether the habit of demanding rigorous evidence, which is the essence of science, and indulge in utterly irresponsible statements based on complete ignorance as to the nature of religion, morality, and their history.

I do not wish to restrict the liberty of prophesying. A scientific specialist has a right to be a member of a church as of a political party, and to be as confident as a good hus-

band or anybody else that his is the best possible choice. But he has no right to claim the authority of science for it. The theory that atoms are composed of electrons cannot prove liberal Protestant theology, nor does the "curvature" of space establish the truth of the Christian moral code. It is sentimental vanity and not science to speak of man as the highest outcome of evolution. In point of sober fact every existing species is just as much the last stage of "evolution." And the probabilities are that man will disappear long before the bacteria and other "lower" forms which now feed on him, but which have a more ancient and more stable biologic existence. None of the facts of natural selection prevent the stupid from multiplying their kind or the cruel and ruthless from surviving in the brute struggle. Biology does not show us more righteousness in the world than that which human beings exercise; and the ancient observation is still true that rain, sunshine, and earthquakes, growth, disease, and death visit the just and the unjust alike.

There are many today who cry out hysterically that without the anthropomorphic illusion the value of life and all zest for it disappear. We may sympathize with the personal distress of those who cannot emotionally readjust themselves to new views. But we must not forget that anthropomorphism has been at the root of the superstitions that have made human life full of hideous terrors, so that emancipation from anthropomorphic religion has been hailed by many, from the days of Epicurus and Lucretius to those of Shelley and Bertrand Russell, as the most joyous and beneficent liberation. Certainly it is possible for a materialist like Democritus to be known as the most cheerful and benevolent of philosophers, and for a thoroughgoing naturalist and opponent of anthropomorphism like Spinoza to be a model of serenity and of the intellectual love of God.

So long as we lack omniscience and omnipotence life will necessarily contain a tragic element. Death will continue to rob us of those we most dearly love, and unforeseen circumstances will frustrate our most cherished plans. But we cannot overcome this by wilful illusion, any more than the ostrich (according to the slanderous account of ignorant mortals) can escape the hunter by burying his head in the sand. And if we are told that some do attain bliss through ignorance, we reply that success in a lottery is no argument for lotteries. The safer way to peace and serenity is through the cultivation of intelligent courage and wise resignation. We need courage to look into our own heart and clear it of the foolish desires which make us sow vain hopes and devote needless toil and anxiety to raise bitter crops of disappointment. And we need resignation to learn to live in a world that is not formed just for our comfort. A wise Frenchman has well said that we need not throw to the dogs all that is not fit for the altar of the gods.

It is fashionable today to despise this ancient wisdom and to profess the belief that the progress of science will enable us to conquer nature completely so that we shall have a heaven on earth. Sober facts, however, give no support to this vain hope. Great as has been the contribution of science to human comfort, it has undoubtedly also served to increase our unsatisfied desires and our capacity for poignant suffering. Thus despite the beneficent progress of medicine it is not at all certain that life has become on the whole less painful, and there is every indication that the habits developed by our machine age are reducing the span of years

which the adult American can be expected to live. Moreover, it is possible that with the decline of liberalism and the gradual uniformity and standardization of ideas which modern machinery facilitates, we may choke that free intellectual variability which is the source of genuine progress in science. Many conditions in Russia, Italy, and even in the United States point in that direction. In any case the history of the human race offers a picture of an arduous and perilous journey in which each one of us drops out before the end is in sight. What makes it possible for us to carry on, instead of quitting as we can when we really want to, is not our guess as to the unknown goal, but rather the zest developed by our actual daily experiences, by our organic activities, by the light and warmth of the sun and air, and by the joys of human companionship. When the zest for life is really gone all words of comfort or exhortation are vain. There is nothing to which to appeal. But wise reflection may fan the flame when it is low, illumine our labor, and increase the scope of our peaceful enjoyments.

The realization of the pathetic frailty of the knowledge or beliefs on which our life depends, thus leads not to despair but to open-eyed courage. But it also points to a most intimate connection between scientific method and liberal civilization. Science is not, as it is popularly conceived, a new set of dogmas taught by a newer and better set of priests called scientists. It is rather a method which is based on a critical attitude to all plausible and self-evident propositions. It seeks, not to reject them, but to find out what evidence there is to support them rather than their possible alternatives. This open eye for possible alternatives, each to receive the same logical treatment before we can determine which is the best grounded, is the essence also of liberalism in art, morals, and politics. Conservatism clings to what is established, fearing that if we let go, all the values of life will perish. The radical or revolutionary, impressed with the evil of the existing order or disorder, recklessly puts all faith in some principle without regard for the hidden dangers which it may contain, let alone the cruel hardships which readjustments must involve. The liberal views life as an adventure in which we must take risks in new situations, but in which there is no guaranty that the new will always be the good or the true. Like science, liberalism insists on a critical examination of the content of all our beliefs, principles, or initial hypotheses and on submitting them to a continuous process of verification so that they will be progressively better founded in experience and reason.

It is fashionable nowadays to belittle the reasons men give for their faith. "Who," asks James, "ever heard of anyone changing his religion because of a reasoned argument?" It is difficult to answer this because we have no way of counting all those who, though unwilling in the heat of argument to admit the force of their opponents' reasons, yet sooner or later are so affected by them as to use them against others. Reasons are themselves part of our beliefs. And can we maintain that beliefs are of no influence in our lives?

On matters of human life and fate those addicted to much reasoning have not been generally placed in the foremost rank occupied by the great religious and moral teachers. Simple folk distrust those clever fellows who by reasoning seem to make the worse appear the better cause. We recognize the substantial unsoundness of certain conclusions be-

fore we are able to place our fingers on the exact fallacy in the argument which supports them. All this applies also to the seemingly more cautious and technical reasoning which passes as scientific method. Sound judgment often rightly rejects propositions in education or social science that are "proved" by formal definitions, statistical charts, graphs, and other paraphernalia. For superficial research workers, too readily impressed with their easily learned methods, often lack the native intelligence or breadth of view to prevent them from giving absurd interpretations to their statistical results. No amount of training in rational science can supply native intelligence where it is lacking. Yet training in reason is undoubtedly a necessary aid to all who can learn. How far it is necessary to make our reasons explicit depends on diverse circumstances. But we are generally safer if we have carefully reasoned out our position.

The prophet may deliver his burden with no warrant but the awful "Thus saith the Lord"; and the poet may impose his own passionate vision without any authority except the magic of his words. But men must use reason to weigh the truth of what rival prophets and poets have said. And he who helps them to reason more justly renders a service second to none in importance and beneficence.

Unless men reason they remain sunk in blind dogmatism, clinging obstinately to questionable beliefs without consciousness that these are mere prejudices. "To have doubted one's own first principles," says Justice Holmes, "is the sign of a civilized man." And to refuse to do so, we may add, is the essence of fanaticism.

The fanatic clings to certain beliefs and in their defense is ready to shut the gates of mercy on mankind, precisely because he cannot see any alternative to them except utter chaos or iniquity. Rational reflection, however, makes us see other possibilities and opens our minds to the thought that some of the moral or physical principles which seem to us self-evident may be only sanctified taboos or inherited conventions. The latter may be useful and necessary to save us the trouble of painful thought for which we have no time or inclination in the rush of our practical activities. But they may also be obstacles to a richer life.

Those who confuse life and external motion often claim that thought or reflection makes our action less resolute, and they urge us to stop thinking and do something. But that men's thoughtless or impulsive acts are always wiser than their reasoned conduct is hardly shown even in the case of Hamlet. To reflect that in the absence of omniscience all our principles of morality and conduct are but hypotheses need not prevent us from staking our lives on these anticipations of experience and from fighting as valiantly as we can for what we hold dearest. But it makes us more chivalric, tolerant, or sympathetic with those poor souls who risk their all on some other guess. I do not believe in the adequacy of the usual sentimental interpretation of the Golden Rule to love my neighbor as myself. My neighbor has a right to think the form of my love for myself quite foolish and to resent having it inflicted on him. Nor do I see any good in loving my neighbor's wife and children as my own. Love means discrimination and preference, and the obverse of that is natural aversion. Civil society depends, not on blindness or insensibility to the loathsome traits of our fellow-mortals, but upon respecting their rights without taking them to our bosoms. This can be achieved only through sympathetic

understanding. Cooperation with those from whom we differ is possible only if we rationalize our beliefs and thus make them intelligible to those having different backgrounds.

In general the value of rationality is similar in morals to that in science. It enables us to frame policies of action and ethical judgment fit for wider outlooks than those of immediate physical stimulus and organic impulse. In en-

abling us to anticipate the future and adjust ourselves to it in advance, it lifts us above the necessity of living from hand to mouth in the mere immediacy of the moment. It thus enlarges our being and gives us strength to contemplate new physical and moral possibilities without that vertiginous bewilderment which comes to creatures of mere routine when they face the unfamiliar.

Danger Ahead in the Coal Strike

By MAURITZ A. HALLGREN

Pittsburgh, July 21

TODAY the coal strike in western Pennsylvania and eastern Ohio has an outward appearance of peace and quiet. True, numerous reports of violence have come into Pittsburgh during the past week. Only yesterday William Simon, member of the National Miners' Union, was shot to death in a picket-line skirmish at Martins Ferry, Ohio, while the day before more than a hundred persons were injured when a United Mine Workers' meeting at Canonsburg, Pennsylvania, broke up in a riot. A few days earlier a miner's home was set afire at Midland near Canonsburg, and a company house at Atlasburg was wrecked by a bomb. Moreover, nightly attacks on unescorted strikers and workers continue in various sections of the coal country. But these are only surface indications of a tense situation. The violence thus far reported, with the exception of the killing of a miner by a deputy sheriff at Wildwood a few weeks ago, has been sporadic in nature. It has mostly resulted from the taut nerves and growing uneasiness of the strikers. Everywhere one goes through the bituminous fields one finds evidence of this nervousness. A stranger in a coal town is eyed with deep suspicion; husky, desperate-appearing men move over to meet him, putting him on the defensive with their menacing silence until he establishes his identity. The Communist organizers in every mine town, and even many of the agents of the United Mine Workers, have their personal bodyguards. Many of these men are armed, though I learned by careful inquiry that for the most part it is the U. M. W. A. agents who are carrying guns.

In such an atmosphere anything may happen, and there are competent observers here who believe it will happen soon. Yet the tenseness to be observed in the coal fields is only in small measure due to organized agitation. It has grown of itself, fed upon starvation wages and harrowing working conditions, and has not been directly fostered by either of the two unions involved in the strike. Officials of the National Miners' Union have made a sincere effort to check the violent inclinations of some of their followers. Some weeks ago Vincent Kemenovich, official of the N. M. U., was quoted by the *New York Times* in a dispatch from Pittsburgh as sounding "a warning of impending trouble" and revealing that "the strikers are armed." Kemenovich denied to me that he had ever made such a statement. He declared that a threat of this sort would have made him liable as an accessory before the fact in any criminal case arising out of violence on the part of the strikers. That the authorities would not hesitate to proceed against Kemenovich, if the opportunity presented itself, is

indicated in the case they are trying to build up around Thomas Myerscough, another N. M. U. leader. Myerscough led the demonstration at the Wildwood mine a few weeks ago. He was arrested before a single shot had been fired or head cracked by the deputy sheriffs. He sat quietly in the sheriff's wagon throughout the shooting that followed. He was found to have been unarmed. Nevertheless, he is now being held, with Deputy Sheriff Herbert Reel, on charges of manslaughter in connection with the killing of Pete Zigarac, one of his own pickets.

Some of the rank-and-file speakers at Communist meetings are, however, advocating violence. At Fredericktown in Washington County Colston Warne, William Nunn, and I heard a speaker named Williams urge the strikers to "wait for the scabs in front of their homes and bust 'em in the snoot when they come from the mines." At the N. M. U. conference held here last week Jim Grace, striker from Harlan, Kentucky, declared: "We must show a united front, and if necessary shoulder arms and fight for freedom." Almost every camp we visited was literally deluged with copies of the *Daily Worker*. Bloodthirsty headlines were flaunted before the hungry strikers: "Secretary of Chinese Communist Party Executed; Wall Street Is Back of His Murder"; and "Beat Back Scabs in Mill Strike." Such inflammatory stories cannot help inciting the coal workers to violent action. More than that, the strikers seemed to find unusual satisfaction in reading stories of this sort. No other literature or newspapers were to be seen, but it is doubtful whether at this stage anything but the *Daily Worker* would have a real appeal for the long-suffering miners.

Yet it is obvious to anyone who spends a few hours in the N. M. U. headquarters on Pennsylvania Avenue that the Communists are not looking for trouble. Their war along three fronts in the coal fields—against the operators, the United Mine Workers, and starvation—is altogether too serious a matter for them to allow their followers to get out of hand. They know that an invasion of the bituminous country by the State militia or by federal troops, which is constantly being rumored, would quickly follow widespread outbreaks, and would just as quickly put an end to their activities. Hence they are attempting to proceed along non-violent lines, using orthodox strike tactics to further their ends. Despite this subordination of revolutionary aims, the Communists here are operating on a war basis. The most powerful of the party leaders, among them William Z. Foster and Alfred Wagenknecht, have come from New York to assist Frank Borich and Vincent Kemenovich, the

N. M. U. officials, in conducting the strike. Working with them are numerous officials and organizers of the Trade Union Unity League, who attend to the more important details and acts as liaison officers between Pittsburgh headquarters and the leaders in the field. Routine office work is handled by younger members of the party who receive no compensation of any kind. They live off their savings while they do secretarial work, turn out circulars, receive visitors, answer telephones, and run errands. When their money gives out they leave Pittsburgh to return to their old jobs or to look for new ones, and other young Communists come in to take their places.

The demands of the N. M. U. are not comparable with the absurd demands the country has come to expect from Communist strike leaders. They ask for a scale of wages higher than those now being paid, but lower than the Jacksonville rates, for a union checkweighman at every mine, for enforcement of the eight-hour day, and for recognition of their union. Nothing whatever is said about revolution, or about labor participation in the management of the industry. The U. M. W. A. could not be more reasonable. In fact, the very moderation of the N. M. U. program has forced the United Mine Workers into a position where they must either offer the miners something more and thereby decrease their chances of winning over the operators, or something less and so lose what little they have left in the way of rank-and-file support in the bituminous fields.

Three weeks ago the U. M. W. A. signed an agreement with the Pittsburgh Terminal Coal Company, although the United Mine Workers had had nothing to do with the strike in the Pittsburgh Terminal mines. It was organized and managed solely by the N. M. U. For a week or two it looked as if this was the entering wedge that would separate the Communists from all hope of victory. It was widely believed that other operators would follow suit, using the U. M. W. A., which they had for years been fighting to destroy, as a weapon with which to beat off an even worse menace, the National Miners' Union. All along it had been clear to the Communists that this was the one factor the United Mine Workers had been depending upon; the latter would let the Communists bear the brunt of the strike and then themselves step in and appropriate the fruits of victory. The plan might have worked had the Pittsburgh Terminal agreement given the men anything at all resembling an improvement over present wage scales and working conditions. But, as Vincent Kemenovich put it, "the men went on strike against starvation wages, and now they expect them to accept a scale that is even lower." It is not entirely fair to say that the Pittsburgh Terminal wage rates are lower under the new agreement, but because of more difficult working conditions imposed upon the miners the pay actually received often works out that way. I have before me a pay slip issued to one of the employees of this company. It shows that for a half-month's work ended February 15 this man earned exactly \$12.40. But the man's debts to the company for medical fees, powder, and purchases at the company's store (where prices are from 60 to 100 per cent higher than in the independent stores) were greater than his earnings, so the space marked "Balance Due" was filled in with two crosses (called kisses by the miners). He received not a cent in currency for his half-month's work, and had received nothing for more than a

year. He was forced to live on credit at the company store, and so was constantly in debt to the company. The U. M. W. A. agreement would, he thought, improve this situation, but it failed to do so, and therefore this man again has quit work. He found the wage scale had increased, but so, too, had the amount of dead-work (removal of slate and debris for which the miners are not paid), and the timbering (which likewise draws no compensation) had also increased. The result was that he was getting less pay, not more, for the amount of actual labor he was performing.

One of the Pittsburgh Terminal mines affected by the agreement is that at Coverdale, Pennsylvania. It normally employs 910 men; the agreement brought more than 800 back to work. But at the end of the first week this number had dropped to less than 600, and on the following Monday only 391 men reported to the pit bosses for work. Picketing by N. M. U. strikers may have been partly responsible for the defection. On that particular Monday morning we went out early to watch the picketing. The strikers gathered on a public road just as dawn was breaking. They were not fighting men; they looked cowed and despondent and noticeably undernourished. A few of them hobbled on canes, so old were they. And when the deputy sheriffs and State police drove up in their impressive automobiles, the strikers took on the aspect of whipped dogs. The deputies kept them moving in silence, arranging their line of march so as to keep them out of sight of the mine tipples more than half the time. One man was arrested for calling out to the few workers who came that way, and others now and again cried out with little enthusiasm: "Come on, you scabs, join the line." The whole show was pathetic; it could not by any stretch of the imagination be called effective picketing. Yet a hundred fewer men reported for work that morning. They stayed away, as some of them told me, not because of the picketing, but because they were "just as bad off under the new agreement" as they had been before.

As a matter of strike strategy the United Mine Workers have been outdone by the Communists. The latter have entered every field in the Pittsburgh area. They have planted organizers, disciplined working men and women, in almost every company "patch." They have mapped out their fight on a working-class basis. The United Mine Workers have been largely inactive so far as organization goes. In only one or two of the fields have they taken a hand in leading the strike. They have made the mistake of sending well-dressed, well-fed officials and organizers to talk to the miners. They have made the further and more serious mistake of compromising with the operators in the matter of the Pittsburgh Terminal agreement, and the rank and file are openly saying that the U. M. W. A. "tried to sell us out when they signed that agreement." In consequence the United Mine Workers have lost most of their former supporters. We found very few miners who would speak well of the organization, and even among the U. M. W. A. members a feeling of deep bitterness toward the officials, particularly John L. Lewis, was unmistakably revealed. Indeed, I have never heard a man denounced in more venomous terms than those I have listened to here in the last few days. Only one man was to be found, a paid U. M. W. A. official, who had a kind word to say for President Lewis. It is probable that Dr. Warne was correct

when he said after our tour: "The time is rapidly passing when operators will have the option of signing with the United Mine Workers." Indeed, to a lay observer such as myself it would appear that that time has already passed. Meanwhile, with the operators refusing to deal with either union, with the Communists and United Mine Workers at

each other's throats, and with the chances growing that a settlement between operators and miners at this late day will not solve the basic problems, the bituminous industry continues to drift into a zone of real danger. Further drifting can only mean open warfare, civil strife on a scale unprecedented in this country.

Does France Want War?

By ROBERT DELL

Paris, July 13

WITH the main argument of Professor Guérard's interesting article in *The Nation* of July 8 I entirely agree. We must get rid of this "guilty nation" myth, which is still too prevalent in Europe. I notice with alarm that too many people in England have become as unreasonably anti-French as they were unreasonably anti-German a few years ago. But I cannot agree with all that Professor Guérard says about official French policy and there are some inaccuracies in his article.

1. "France," that is, official France, certainly does not desire disarmament. She is the greatest obstacle to it in Europe. Official France may desire peace, at any rate does not want war, but does any government ever want war if it can get what it wants without it? War comes because there are certain things that governments want more than peace, and because they pursue policies that lead to war. Briand has twice publicly threatened Germany and Austria with war if they make the *Anschluss*. French expenditure on armaments is much more than \$357,556,000. It is about \$750,000,000 a year, including the instalments for the fortifications of the new eastern frontier (on the other side of which is a demilitarized zone guaranteed by the Treaty of Locarno). But it is dissimulated by the distribution of large sums in the amounts voted for departments other than the military and naval departments. This dissimulation was exposed in detail a few months ago in an article in the *Paris Populaire*, to which no reply has ever been made. Moreover, French expenditure on preparation for war steadily increases. The total army effectives in 1930 were not 467,987, but 555,087 (*Annuaire Statistique*, page 272), and I am doubtful whether this total includes all the colored troops, although it professes to include them. This is about the same as the figure for 1912. No comparison can be made with 1913, when war was believed to be imminent and the conditions were abnormal. The number of conscripts under the colors has been reduced by the reduction of the period of military service to one year (it was two years in 1912), but the number of professional soldiers has been increased. And this is the French army on a peace footing; on a war footing it consists of all able-bodied Frenchmen and hundreds of thousands of native conscripts from the colonies. Germany, on the other hand, which in 1912 had also an army on a war footing consisting of all able-bodied male inhabitants, has now an army of 100,000 in peace or war. The tonnage of the French navy allowed by the Franco-Italian naval agreement was about 10 per cent less than the tonnage of the French navy in August, 1914, and official France has now, by a shocking breach of

faith, repudiated that agreement on the ground that it did not give France a sufficiently large navy. The tonnage of the British navy allowed by the London agreement is 47 per cent less than its tonnage in August, 1914. The war of the future is likely to be mainly in the air. France is now spending on her air force two and a half times as much as she was spending six years ago and has the largest and most formidable air force in the world. England is spending rather less on her air force than six years ago and has deliberately allowed herself to fall to the fifth place among the nations of the world as regards the air force. Germany, of course, has no air force at all. An air force is a purely offensive arm. In short, France is the most formidable military power in the world. Her armaments far exceed what she requires, on the most liberal estimate, for purposes of defense. Official France maintains these immense armaments, if not with aggressive intentions, at least as an instrument of political domination.

2. Professor Guérard says that "France" believes that peace must be based on world organization. So do we all, but official France wants a form of organization, at any rate of European organization, that will stereotype the territorial status quo in Europe and prevent its alteration even by peaceful means. She is definitely opposed to the revision of the peace treaties by any means and says so frankly, although she has been forced to accept certain modifications in them. The arbitration accepted by official France is a purely juridical arbitration. The only function of the arbitrators is to be the application of the treaties—they are never to arbitrate *ex aequo et bono*, that is, on the merits of the case. The British conception of arbitration, on the other hand, has always been arbitration *ex aequo et bono*. To put it in another way, France stands for the letter of the law alone—or of what passes for law—Great Britain for law and equity. This divergence, which is to be seen in the respective judicial systems of the two countries, is at the bottom of all the difficulties at Geneva about proposals for what is called "organized security," such as the Protocol of 1924. There are also different conceptions of "security." Some of us, including the French Socialists, maintain that security will be obtained by arbitration and disarmament. The French official view is that there can be no disarmament until "security" has been obtained—by continuance of armaments.

3. I agree with Professor Guérard that the French alliances are liabilities, not assets, but that is not the official French view, nor was it with the aim of incurring liabilities that the French system of alliances was created. It was with the aim of making a "barbed-wire barrier," to use Clemenceau's phrase, against Russia and also Germany. I

do not understand how Professor Guérard can say that France did not group the allied countries under her leadership. The whole system of alliances was initiated by France in 1919. If Professor Guérard is right, why does France cling to her system of alliances? Out of purely disinterested benevolence? At Geneva, in 1924, Briand and Paul-Boncour on behalf of the Herriot Government refused to abandon the alliances even in return for the protocol. The British delegation proposed that all alliances should cease five years after the ratification of the protocol. France refused to agree. I may add that the existence of secret military conventions between France and certain other countries is a standing violation of the Covenant of the League of Nations and those conventions are null and void by the Covenant because their text has not been registered and made public. Any French or other signatory government could therefore repudiate them, and I hope that some day that will happen.

4. It is a historical fact that France militarized Czechoslovakia, Poland, and her other allied countries. Their armies have been created with French money, French war material, and by French officers. France (and England too) egged on Poland to make war on Russia and refused to allow Pilsudski and Paderewski to make peace when they wished to because Russia had offered them extraordinarily favorable terms. All the credits given by France to Poland had to be spent in France on war material and military equipment. A Polish prime minister told me so; he said that Poland had never received a single penny in cash from the French Government. France is now arming Yugoslavia against Italy. After the armistice the German Government offered to give Poland an access to the sea by making the Vistula navigable for big ships and giving Poland a port at its mouth. The French Government forced Pilsudski to refuse the offer and cut Germany in two so as to keep Poland and Germany permanently at enmity. It was part of Clemenceau's policy. (Several countries in Europe, by the way, have no access to the sea and seem to get on all right without it.) There is reason to believe that some of the military conventions that France has made with other countries force those countries to keep their armies up to a certain strength. In short, the French system of alliances is, as Briand let out in an unguarded moment in the chamber (the remark was omitted from the report of his speech in the *Journal Officiel*), incompatible with the Covenant of the League of Nations and it is one of the greatest obstacles to any sort of world or European organization. If it continues, it must lead to the formation of a hostile combination and the division of Europe, as before 1914, into two armed camps. France has created a league within the League and on almost every occasion has said: "My allies right or wrong." Has Professor Guérard forgotten that France prevented the League Council from taking any action when Poland seized Vilna by force? Does he know what the French attitude at Geneva is about questions of "national minorities" when the country concerned is an ally of France? Has he read Briand's abominable speech on the question of minorities at Geneva last September—a speech which a member of the British delegation described to me at the time as the most perfidious that he had ever listened to?

I rub my eyes when I read in Professor Guérard's article that France has proposed the United States of Europe. Can he possibly be referring to Briand's memorandum in

May of last year? The first step toward the United States of Europe is the suppression of tariff barriers between the European countries. Not only does France oppose even the smallest step in that direction—including the harmless "tariff truce"—but she tries to prevent other countries from suppressing their tariff barriers and keeps on raising her own.

If, as Professor Guérard thinks, the trend of French policy is likely to remain unchanged in the immediate future, heaven help Europe! But I am more hopeful than Professor Guérard, for I see symptoms of growing opposition to that policy in France. Daladier, president of the National Executive of the Radical Party, has proposed that the alliance with Poland should not be renewed when it expires next year. There is an increasing belief that the alliances are liabilities, not assets. The Socialist Party at its congress at Tours quietly dropped for the first time Jaurès's scheme of a "national militia" (formulated at a time when Germany had conscription), which is the first step toward a policy of abolishing conscription. There are also disquieting symptoms. The temper of the French bourgeoisie is very bad on the whole—unpleasantly like the temper of 1912. Too many people talk about sending an army corps into Germany—they have virtually forgotten the Treaty of Locarno. The servile press has worked up violent hatred of Germany and America, and cartoons in every satirical paper represent Uncle Sam as a sort of Shylock cutting off for the benefit of Germany a pound of French flesh. Yet if America or England or both would only give a strong lead in the matter of disarmament, there might be a response in France that would surprise everybody. There will be a general election in France while the disarmament conference is sitting—unless it breaks in confusion at an early date—and if the French supporters of disarmament were given something to fight on, the result might be very satisfactory. The French always like a principle and no principle appeals to them more than that of equality. Try them with the principle of equality between all nations in the matter of disarmament, that is to say, the acceptance by all nations, *ceteris paribus*, of the conditions imposed by the peace treaties on the conquered countries.

In the Driftway

THE world, as commentators have observed from time immemorial, is full of paradoxes and illogicalities. Take railway cars. Now the Drifter enormously prefers the American Pullman, or even the day coach, to the European compartments, which give one the benefits neither of privacy nor of publicity. The seats are uncomfortable, and half of the passengers are compelled to ride facing backwards and to sit staring at the other half. The first trains, of course—as anyone can see either from illustrations or in the specimen on exhibit at the Grand Central Terminal—were merely a series of stage-coaches hitched together with a locomotive in front. The European mind, being conservative, when it developed the later railway carriage simply telescoped a series of stage-coaches—the present compartments—on to one set of wheels. The American mind, more enterprising, less tradition-bound, designed the day coach and the Pullman.

* * * * *

BUT confronted by the problem of the sleeping-car, the American mind broke down. The Drifter speaks with feeling, for, after a blessed respite, he was recently obliged to travel on one. Now no one except a professional Japanese acrobat, the Drifter contends, can learn to get undressed and dressed without not merely exasperation, but a profound sense of personal humiliation in the cramped horizontal position which the Pullman berth compels. What becomes of the concept of personal dignity when one tries to get one's trousers on or off in such a position? How women put up with the more complicated processes of their toilet under such conditions the Drifter cannot conceive. True, some passengers attempt to stand while dressing, but run the grave risk of getting badly bumped and having their feet stepped on by people walking down the aisle. Further, the Pullman curtain does not even assure privacy, and is surely no protection whatever against adjoining conversations.

* * * * *

THE European *wagon-lit*, an adaptation of the European compartment, is at least a generation ahead of the Pullman sleeper. It is private; it shuts out other people's talk; it is comfortable to sleep in, and it permits one to undress and dress sitting down or standing up, like a lady or a gentleman, instead of prostrate on one's back. Well, there are hopeful signs. The Pullman company in the last year or so has introduced what the Drifter thinks it calls "double-bedroom" cars, which are practically arranged like the European *wagon-lit*. Such cars, however, are still very few in number, and available only on such crack trains as the Twentieth Century. And for travelers going alone they are pretty expensive. Americans will probably continue to suffer from the Pullman sleeper for at least the next twenty years; and as, with heads and heels on the mattress, they arch their backs to get their trousers or girdles on, they will even congratulate themselves on living in the country that surpasses all others in its rapid adoption of the last word in physical and mechanical comfort.

THE DRIFTER

Correspondence

A Cry for Help

TO THE EDITOR OF THE NATION:

SIR: This is a bitter cry for relief.

On July 6, 23,000 coal miners in the Kanawha Valley of West Virginia came out on strike against starvation. Coal operators have repeatedly refused to meet the West Virginia Mine Workers in joint conference. As a result, 90,000 human beings—workers, their wives, and little children—are today crowded together in the bleak mining camps of West Virginia, putting up the fight of their lives in the lowest-paid mining area of the country. To their demand for decent conditions and a more tolerable existence, the coal operators have replied with wholesale evictions and the guns of private guards.

These are the days when miners' children follow their mothers about the kitchen asking for food—and there aren't any potatoes or flour in the house. The child who gets even canned milk is lucky. Not new conditions these, but the ones which have existed for years, since the union was destroyed. Now the miners are seeking through their own endeavors to win freedom and a little happiness for themselves and their children. A strike means suffering, but there is no other way that they can win through to better days.

This is therefore a blunt, perhaps too blunt, request to give and give hard. Your contributions will give these workers food and spirit to carry on their struggle. Make checks out to Forrest Bailey, Treasurer, and mail immediately to the Emergency Committee for Strikers' Relief, Room 1001, 112 East Nineteenth Street, New York City.

New York, July 10

NORMAN THOMAS, Chairman

JOHN HERLING, Acting Secretary

H. A. Miller—Teacher

TO THE EDITOR OF THE NATION:

SIR: In the discussion of Herbert Adolphus Miller's treatment by Ohio State University one central factor seems to me to be inadequately stressed. A professor's public activities often receive notice, while enlightened teaching, year in and year out, is less likely to attract attention. As a former student under Professor Miller, before he went to Ohio State, I want to add that this case is of public concern because it involves one of the finest teachers ever available to an American university.

There would be some to differ. Miller has never had any use for cut-and-dried formulas in education. He was always cynical about the grading system revered by orthodox pedagogues. He would never stand over a lazy student with any sort of whip. The main point is that Miller has the power of being fascinatingly interesting to alert pupils, of making education adventurous, of stirring his students to seek new facts and appreciations for themselves. He was a pioneer in the educational method of taking students directly into contact with the institutions they were investigating. If he occasionally minimized the more formal outlines of his courses, he always had on tap an amazingly wide knowledge, flavored with a mellow and essentially tolerant philosophy. A mind would be hopeless if it did not grow under his stimulus.

Entirely apart from his extra-curricular interests and public services, Miller's unique value as a teacher is the greatest loss to the student body of Ohio State.

Brussels, July 7

DEVERE ALLEN

This Is the Death

By HOWARD MCKINLEY CORNING

This is the death: the dying of the hands;
The slow, pathetic parting of no pain—
The summer wasting in a cage of sands
Whereon time pours like rain.

It is so frail a passage to this sleep;
So numb along the wrists the respite moves
The fingers loosen what they most would keep,
Rapture from what it loves.

Where then is heard the bell, exceeding sweet,
Swung by the hands to music; and where then
The chosen clusters that the lips might meet,
As once—and not again?

It is the hands slow dying into age
Before the sentient pulse; it is the rapture
Numb in the crimson shadow of its cage—
Is the death they capture.

There is no other death: that the hands refuse
All that once was their brave analysis.
This is the long farewell, and we cannot choose
Death other than this.

The Faiths They Live By

Living Philosophies. By Albert Einstein, John Dewey, Sir James Jeans, H. G. Wells, Theodore Dreiser, H. L. Mencken, James Truslow Adams, Julia Peterkin, Sir Arthur Keith, Irving Babbitt, Beatrice Webb, Joseph Wood Krutch, Fridtjof Nansen, Lewis Mumford, Robert Andrews Millikan, Hu Shih, Hilaire Belloc, J. B. S. Haldane, George Jean Nathan, Irwin Edman, Bertrand Russell, and William Ralph Inge. Simon and Schuster. \$2.50.

THIS is a profoundly interesting volume, and from some aspects a very important one. Future generations may find it an invaluable guidebook to the intellectual temper and the winds of doctrine that prevail in our own day. Where the contemporary reader sees mainly the individual differences between the views of these contributors, his son or grandson, with the advantage of the perspective that only time can give, will see the common underlying assumptions and attitudes that more or less unite them. How grateful we would be today for a compact volume like this in which a score of the great Victorians—Darwin and Carlyle, Huxley and Arnold, Spencer and Newman, Pater and Dickens, Gladstone and Bradley—had attempted to set down in a dozen pages each their credos and “philosophies of life”! How much more grateful, many of us, for a similar symposium compiled by the great figures of the eighteenth century, the Elizabethans, the Florentines, or the Greeks! Perhaps only two or three of the twenty-two contributors to the present volume reach the stature of the great Victorians just named; yet what most of them have to say is surely worth attending to, and not a few of the credos are written with charm and flavor.

The reviewer's task in dealing with such a volume, how-

ever, is not an easy one. A summary of each of these twenty-two philosophies in turn would be dull, disconnected, and probably fatuous; a doctrinal criticism would simply add a twenty-third philosophy; while to pretend to find something common among all of them would be disingenuous, and probably lead to serious misrepresentation; such common elements, as I have hinted, are likely to be discovered only by our descendants. The only thing the present reviewer can find in common, for example, between Theodore Dreiser's contribution and Hilaire Belloc's is that both of them are half irritating and half amusing: Belloc's because of its narrow and cocksure Catholicism (“The Faith explains; it explains fully; and it is the only thing that does explain”), and Dreiser's because of its naive and almost equally dogmatic nineteenth-century mechanism, as well as its general messiness of thought and expression.

Yet there are, it is true, one or two qualities obviously common to a large number of the contributions. Most of the contributors have attempted to set down their beliefs in as highly generalized a form as possible, and they have, instinctively perhaps, attempted to set down the views which they believe to be personal to themselves, rather than those that are commonly accepted or already incorporated in the established sciences. Thus Sir James Jeans tells us nothing of his specific opinions in his own science of astronomy, but rather of his views on such leading social questions as democracy, socialism, and eugenics. (In this field he turns out, incidentally, to be surprisingly reactionary, and hardly very scientific: for example, in discussing eugenics he makes the implicit assumption that the persons with the soundest physical and mental genes are identical with the present “successful classes”; it would be interesting to hear what a biologist like H. S. Jennings would have to say about that.) Nearly all the contributors, also, tell us something of their religious beliefs—or rather, of how they came to abandon their religious beliefs. The contributions of Bertrand Russell and the Chinese writer Hu Shih are particularly appealing because they are not merely cross-section views of their present outlook, but brief intellectual autobiographies.

It is significant, also, that hardly any of the contributors attempt to tell us what they believe is “the meaning of life.” Several of them regard the question itself as absurd. Thus Irwin Edman writes that he does not believe that “life in general or the world in general has any meaning”; he does not even think “there is any meaning in saying that they could have.” But, he adds, “many things, all things in nature, may have meaning; and any life may generate its own purposes or ends. . . . Not what life means, but what meanings it may have, is what counts.” John Dewey expresses a similar view, and considers it vicious as well as pointless to talk of the meaning of life or the purpose of the universe, because such a monistic approach prevents us from recognizing the “plurality of interconnected meanings and purposes” that human life may have. Einstein, finally, remarks that “to ponder interminably over the reason for one's existence or the meaning of life in general seems to me, from an objective point of view, to be sheer folly.” So modern science and philosophy, instead of answering this immemorial question, simply slam the door in its face. Nevertheless, Einstein, too, points out that everyone must hold certain ideals to guide his aspirations: “The ideals which have always shone before me and filled me with the joy of living are goodness, beauty, and truth. To make a goal of comfort or happiness has never appealed to me; a system of ethics built on this basis would be sufficient only for a herd of cattle.” Einstein's contribution, incidentally, is the shortest in the book, and almost as condensed as his revolutionary mathematical papers on relativity.

One more general quality of the book is worth remarking.

Very few of the writers—with the exception of a professional apologist like Hilaire Belloc, or Irving Babbitt, who resumes his usual shadow boxing with the ghost of Rousseau—are inclined to appeal to Authority to support their opinions. James Truslow Adams, it is true, argues in favor of the traditional ethical judgments by appealing to "the wisdom of the race," but this appeal seems to me very dubious. It would be interesting to draw up a list of some of the practices and institutions that this racial "wisdom" has sanctioned in the past: slavery, caste systems, war, conquest, marriage indissoluble on any grounds, complete parental tyranny, religious persecution, the intolerance of any sort of freedom of thought, and the entire network of superstitious taboos—not to speak of the fact that each isolated race's "wisdom" has sanctioned such different practices from the others'. No, the twentieth century doubtless has its own appalling defects, which will be fairly clear to the twenty-first century; but it seems none the less to have reasonably good grounds for examining with a very skeptical eye the alleged wisdom of the ages.

It would be pleasant to go on to discuss some of the admirably provocative contributions of such writers as Lewis Mumford, Irwin Edman, Joseph Wood Krutch, H. L. Mencken, J. B. S. Haldane—But I began by admitting that such comprehensiveness was impossible.

HENRY HAZLITT

A Rounded Biography

Pepys, His Life and Character. By John Drinkwater. Doubleday, Doran and Company. \$3.

CONTRARY to the popular notion the existence of the "Diary" does not render superfluous a scholarly biography of Pepys. In the very frankness of his self-revelation he has quite unintentionally obscured the more substantial basis of his fame. To readers of the "Diary," unless they be uncommonly lacking in response to the charm of human foibles unaffectedly portrayed, Pepys seems a man who found his greatest satisfaction in hours given to mirth; he hardly suggests the serious empire-builder, concerned chiefly with the effectiveness of the fleet and the single-mindedness of men's service to a not always grateful monarch. Mr. Drinkwater's study, easily the finest portrayal of Pepys yet produced, succeeds in giving a true portrait of a whole man. The author makes no effort either to disregard or to deprecate the Admiralty Secretary's lighter moments; he does, however, prove conclusively that the revels with Mistress Knipp or with pretty housemaids do not constitute the entire life of the man. For the Pepys Mr. Drinkwater portrays we feel not merely tolerance or amused recognition, but as well a genuine respect and admiration.

In Pepys we perceive a man who held public office not only because he wanted to earn a substantial livelihood, but even more because he found real satisfaction in making a contribution to the public weal. In a day of lax political morals he did not refuse all irregular emoluments. He did maintain, however, a precious sense of self-respect which made it literally impossible for him to do that which would bring disgrace or material harm upon his beloved London or, even more, upon his England. Pepys loved his fat partridge and his port, and he cherished his shining guineas, but he possessed a sense of integrity that he would not sell to get riches or to preserve his goods. Mr. Drinkwater shows us an industrious and enlightened public servant not afraid to be efficient and honest in the midst of confusion and corruption. And for having done so he deserves the heartiest thanks of all lovers of Pepys, and of all who believe, even though despairingly, in the feasibility of a decent public service.

DONALD A. ROBERTS

Catullus, 1931

The Poems of Catullus. Translated by Horace Gregory. Covici-Friede. \$5.

HORACE GREGORY'S task as the translator of Catullus is not that of the purely literal translator or of the translator who aspires merely to throw the Latin into a conventional English verse heavily laden with poetic diction. Any approximation of the Latin meters in English is impossible, and the inversions of the English speech which invariably result from fitting the Latin phrase to the English metrical pattern are likely to be very artificial. Familiarity with and a wish to avoid these pitfalls, on the one hand, and the desire truly to re-create the poetry of Catullus, on the other, led Mr. Gregory to use modern free verse, a form which is a better approximation of the Latin than most conventional verse forms in English. He knew, moreover, that the flavor, the original freshness, power, and feeling of Catullus could be best conveyed in strictly modern English—English which is not provincial but which is completely of this day and flexible as the literary language of poetry is not.

The poems of Catullus, the young poet who died at thirty, give a fine portrait of the best of the poet's life, and present a record of the times in which he lived. Translated as they are here into modern English—even where the use of an anachronism is necessary to make the idea clear and emphatic for the modern reader—they are as vivid as they were to the friends and enemies of the vehement young singer himself. If this method of modernizing poetry loses something of the richness peculiar to the language of the original, it gains in giving the effect of poetry of our own period; Catullus comes alive again in these translations of Mr. Gregory's, and his verse is made accessible and understandable to the modern reader.

Any translator must meet this problem: Shall he merely recast into acceptable English verse the poems of the original, or shall his task be to revitalize and clarify his texts for the general reader? If he decides on the latter course, he is subject to criticism from the scholars and literary minds of his time; but he certainly has with him the reader for whose delight he has done his work. Mr. Gregory has chosen to run the gauntlet of criticism in order to give his readers the poetry of Catullus palpitating with energy and with its original passion.

Not that Mr. Gregory has erred in matters of scholarship; he knows his Latin and knows it well. His choice of form is deliberate and carefully considered. Catullus, as we know, was one of the greatest of all love poets: his love had a furious intensity wherever it focused itself—upon Lesbia, upon his personal friends, upon nature. And his love could and did turn to hate; he was a good hater. His moods are many, and his styles vary with his moods: there is the plain colloquial Latin of the Lesbia cycle; there is the bitterly pointed epigram; there is the more intricate verse of the long hymns laden with mythological imagery. Mr. Gregory found that by using free verse he could give in his translations a much better approximation to the variety of verse patterning to be found in the original texts, and, moreover, that by using the language of today he could better express the mood of any particular poem. We find some of the best translations in the collection to be those of the romantic hymns, those conventionally patterned marriage hymns in which Catullus draws upon the legendary background of his race. Here Mr. Gregory's lines have all the necessary simplicity and epic dignity:

Here silence and sand cover my words with silence and sand
again, this is my only shelter and hope,
a nightmare with the familiar face of death rising within
my dreams.

But now before death has covered the light of my eyes
with his dark hand, before all that I see, feel, hear has
sunken

into the ground, and there is relief at last even for this body
that knows no rest, only disease of the mind and pain—

I shall call upon the gods, my last words echoing, my sobs
resounding against high heaven
in this my last, my final hour.

Horace Gregory is, perhaps, of all the modern poets, best equipped for such a task as he has undertaken. His own poetry makes use of every nuance in our modern speech, of the entire range of vocabulary from impassioned poetic and literary imagery to the swift and pointed diction of the back streets. His own rhythms are original and develop out of the emotion expressed. They are not the reminiscent and too well-disciplined meters of a strictly literary poet. Nevertheless, his poems are a curious and effective intermingling of classical training (his own verse has been influenced by Catullus) with the accurate observation of a mind particularly sensitive to and analytical of the modern scene with its social and economic complexities. Mr. Gregory feels, evidently, that the world of Catullus was in some measure comparable to our world, that it was a world of unsavory politics, of economic maladjustment, and of intellectual cynicism. In such a period poetry is likely to find its only outlet in the expression of violent personal emotion. Being himself a poet in a world not altogether dissimilar to that of Catullus, Mr. Gregory is able to make the necessary identity between himself and the poet he would re-create, such an identity as must be made if the translation is to be authentic and of literary excellence.

Some criticism has been directed against Mr. Gregory for including among the poems of Catullus the many recovered bits of diatribe and satire which the poet might not have included himself, had he lived to edit his own work. It seems to me there is a decided advantage in having before us, in modern English, these fugitive bits of verse which give us a much more complete picture of the man Catullus and of the circumstances of his life. Have we not chosen to collect and include just such bits among the poems of Herrick, Donne, and Blake?

EDA LOU WALTON

"Progress" Hits Samoa

Samoa Under the Sailing Gods. By N. A. Rowe. G. P. Putnam's Sons. \$5.

THIS is a sane, honest book, a careful attempt to set down for the world at large the series of shameful events which culminated with the shooting down of the young Samoan chief Tamasese in the streets of Apia, New Zealand Samoa, on December 29, 1929. Mr. Rowe gives an excellent picture of the conditions in Samoa at the time that New Zealand took over the mandate—in brief journalistic sketches of parties, meetings, slight episodes between officials and natives, letters written to the insurgent press, contacts with visitors, all of which are used to provide a record of the *mise en scène* which will prove invaluable as precise historical data later. And a very painful story it is, this account of the few years which transformed a happy, self-supporting colony into a comic-opera set-to between hysterical officials and proud and determined natives, a comedy, however, which terminated in martial law and in the death of a chief.

When the former German colony of Samoa was given to New Zealand to administer, one of the first moves of the new government was to pass a prohibition act for whites and natives alike. In the German days natives were not permitted to drink; and a half-caste chose whether he would pay white man's taxes

and drink, or preserve his less expensive native status and not drink. The passing of the prohibition act precipitated ill feeling between the white settlers and the government, and set up on a small scale the same disregard of law which characterizes American prohibition. Under these conditions every other white man turned bootlegger, and the natives learned to drink. Meanwhile the Samoans were subjected to the stupid paternalism of a mean-minded and conceited governor. He forced them to remodel their villages, in which every stick and stone had been numbered from time immemorial; he formed their sons into Boy Scout bands, and tried to set the whole native community, with its graceful, considered patterns of etiquette and social relations, to saluting and forming fours. When native unrest culminated in a refusal of a chief to remove a fence on his own land, for which offense he was exiled from his native village, a body of dissenters known as the Mau formed among the Samoans and the disaffected white people. The governor dealt with it stupidly, refused permission to delegates to go to New Zealand, commanded the whites to disassociate themselves from the natives, barricaded a hill in Apia against the possibility of native attack, and generally showed a lack of tact, a lack of administrative ability which have seldom been equaled in the history of colonial administration. The numbers of the malcontents, under his efficient goading, swelled from a handful of Samoans to all but the entire population; plantations suffered, trade suffered, the League of Nations was annoyed at such unrest in a mandatory; and finally the New Zealand government had to import white police to end the violent disagreements which a few tactful words could have kept from ever beginning.

It is a local enough tale, this story of how a white governor, mad for recognition of his reforms and improvements, shattered the peace and prosperity of one of the most amiable, least contentious, and most peaceful peoples in the world. Mr. Rowe would draw a moral against the Mandates Commission, which he insists incited New Zealand to violence. For this assertion I do not feel that he presents sufficient proof. It is possible to draw a wider moral. This fiasco, like so many others, came from the vanity of a governor who wished to boast of improvements. Back of him stood a political system which would be satisfied only with change, which had no respect for an administration which could report merely peace and prosperity. This is the same Protestant missionizing point of view which demands that native peoples put on trousers and erect frame houses; from a government angle they must build latrines which they don't use, remodel their villages to look like cheap suburbs, and go to school to learn things which will be of no use to them. Unless such reforms are reported, the administration is a failure. As a result, not only General Richardson but other British and American governors also are continually making stupid spectacular attempts to alter the quiet rationale of the lives of native peoples, in order that their home reformers may applaud them. The whole miserable affair in Samoa may be phrased as the attempt of a governor with too much power to please a provincial-minded audience. It is a pity that New Zealand, with her fine record in the treatment of the Maoris, should have become involved in such a disgraceful business.

Mr. Rowe makes some slight attempt to deal with the early history of the country, choosing, mainly from revealing missionary accounts, stories which will point his not unjustified animus against missionaries. Where he does discuss native custom he is accurate and reliable. Of American Samoa he has, most felicitously, nothing to say, except to comment on the way the naval government succeeded in preserving American Samoa from the influenza which swept the Pacific. But the naval governors to date have not had to puff up their reputations with tales of town planning and Boy Scouts. The un-

fortunate results of New Zealand's attempt at government should serve as a sufficient warning to the United States not to demand similar "progress" in American Samoa.

MARGARET MEAD

Books in Brief

The Last Stand. By Edmund A. Walsh. Little, Brown and Company. \$3.

Father Walsh is the outstanding anti-Bolshevik Catholic in the United States. He once represented the Vatican in Moscow, but now opposes any diplomatic dealings with the Soviet state. This book is a shrill cry against the Five-Year Plan and everything that Russia stands for today. Anybody who says a word in favor of the Bolsheviks is an "apologist," but the adverse critics are quoted at length and with the author's approval. Fortunately, Father Walsh can make no pretense at impartiality. This book, and his record, preclude that. "The Last Stand" contains most of the usual anti-Communist arguments thrown, helter-skelter, into one basket and salted down with ineffective invective. "The Fall of the Russian Empire" by the same writer was much better written, but the tract under review is not so gory and sensational as its predecessor. Dr. Walsh promises to continue the discussion in two further volumes. By the time they appear he may know the fate of the Five-Year Plan. Just now, he says, "the scales . . . would seem to hang even." He adds, however, that "the Five-Year Plan may even be a definite challenge to our economic complacency." In a final chapter Father Walsh argues fiercely against United States recognition of the Soviet Government.

Puritan's Progress. By Arthur Train. Charles Scribner's Sons. \$3.50.

This is an odd volume, for the most part highly entertaining, often illuminating, occasionally profound. Mr. Train, writing in the familiar style of the modern magazine article, and stringing his subject matter along the thread of his family genealogical history and his autobiography, discusses such of the changing aspects of American life as suit his fancy. He has delved into many an out-of-the-way corner and dug up a number of attractive little nuggets in the way of anecdote and document. And he has used his many secondary sources to advantage. He branches out into the realms of history, economics, sociology, biography whenever he feels he has something good to say—and usually he has. The last chapters are not so good as the beginning and the middle of the book. One wishes that the last two had been omitted, partly because the method has been overdone and here seems but a faint echo of Mark Sullivan's "Our Times," partly because, especially in the last chapter, Mr. Train, though his optimism and faith in progress may be allowed him as perfectly legitimate, has descended from the wise temperate method of the good popular historian to the banal manner of the conventional "forward looker."

Fiddlers' Green. By Albert R. Wetjen. Little, Brown and Company. \$2.

The presentation of factual material against a fictional background—or foreground—sometimes results in so much confusion of fact and fancy that one is disposed to approach any book employing such technique with distrust. Fortunately preconceived fears turn out to be groundless in the case of Mr. Wetjen's volume. His underlying object is to tell what he has been able to find out about the legends of the sea—the stories of the Flying Dutchman, Mother Carey, Davy Jones, the Man Who Flogged the Dolphin, and others—but these tales are mostly so fragmentary and uncertain that they become more

In the Van

ALMOST, if not quite, too late the emergency conference of seven nations has concluded its three days' sittings in London in a twilight effort to avert ruin for Germany and political chaos for Europe.

How significant, in view of this forced development in late July, is the communication addressed to The Nation from London LAST FEBRUARY 18 by Oswald Garrison Villard. The letter, as it appeared in The Nation of March 18, began:

European conference has followed upon European conference. And so many of them have ended in total failure or a flimsy pretense of success that people everywhere are cynical or disgusted, declaring that "they always end in talk." Fortunately there are exceptions to the record—first of all, the notable success of the late Indian conference, which achieved the apparently impossible, thanks to the courage, skill, and persistency of Ramsay MacDonald. But if there were no favorable precedents whatever, it would still seem to me that another conference ought to be called at the earliest possible moment.

What kind of conference? A conference among the heads of a small group of nations—Italy, the United States, Great Britain, France, Germany, and Belgium—for the purpose of examining immediately the actual situation in Europe and taking some steps to end the present worldwide economic crisis. Here again I hear dissent: Has there not just been an economic conference at Geneva, which gave to the press of the world an excellent statement of economic conditions, signed by twenty-seven nations? The answer is that this is not the time for statements, whether they are signed by twenty-seven nations or by all the nations on earth. What the hour calls for is action, and action before it is too late.

Thus again *The Nation* has vindicated the faith of its supporters and justified its reputation as the most prophetic and valuable American weekly.

substantial when strung on a thread of the author's own fancy. Some will enjoy "Fiddlers' Green" purely as an underseas story of imagination and humor. Others will value it as an anthology of sailor folklore, none the less authentic because of Mr. Wetjen's fictional contribution.

Confucius and Confucianism. By Richard Wilhelm. Translated by George H. Danton and Annina Periam Danton. Harcourt, Brace and Company. \$1.75.

Richard Wilhelm was a German missionary who, instead of converting, was converted to Chinese civilization and became one of the most distinguished Sinologues of our time. The present volume accomplishes a great deal in its small compass. It supplies a translation of those passages in the work of the historian Sse Ma Chien which deal with the life of Confucius; it continues with a bibliographic study of the Confucian classics; then discusses the works of those followers of Confucius who have become incorporated in the Confucian canon; and concludes with a clear interpretation of Confucian doctrine, enforced by specimen texts from the classics. A valuable little book that makes hard but rewarding reading, to which the translators have valuably contributed from their own broad scholarship.

Lost Courts of Europe. The World I Used to Know, 1860-1912. By Marie von Bunsen. Edited and Translated by Oakley Williams. Harper and Brothers. \$4.

Marie von Bunsen, born in 1860 of German-English parents who socially were of the elect, has here set down in a charming style her memories and impressions of a cosmopolitan society thickly sprinkled with notable personalities. The prudish notions of a conventional German upbringing seem to have impeded her for a time, but she early emancipated herself and danced, dined, flirted, traveled, and conversed her way through courts and drawing-rooms in a lively though discreet fashion. One of her experiences was a visit to America in 1888 when her father was a guest of Henry Villard at the opening of the Northern Pacific Railroad. The European celebrities with whom she was on more or less intimate terms include three German emperors—William I, Frederick, and William II—Edward VII when he was Prince of Wales, Bismarck, von Moltke, Disraeli, Browning, Rodin, the explorer Stanley, Queen Carmen Sylva, and the crown princess who became Queen Marie of Rumania. Her observations, while full of vitality, are made with a cool self-possession which makes them a kind of running interpretation of the society of a past age. There is not a dull page in the book. The translation embodies some modifications of the German original, chiefly in the omission of allusions of merely local interest.

A History of the Pacific Northwest. By George W. Fuller. Alfred A. Knopf. \$5.

This history is distinctly of the "local" type. The story of the Oregon country (now divided into the States of Montana, Idaho, Oregon, and Washington) is treated in much the same way that has become familiar in histories of Eastern towns or counties. This is possible because the brevity of the history offsets the vast extent of the territory. The author is apt to slip when he leaves his local footing. For example: his brief statement of the cause of the Mexican War will scarcely satisfy most historians; it is Korea, not Japan, which is nicknamed the "Hermit Kingdom"; the British Minister to the United States who helped to settle the Oregon dispute was Pakenham, not Packenham, as he appears here in each reference. However, the book, like all local histories, must be judged by its fund of local material rather than by its preliminary geological and anthropological chapters or its occasional strays into national history. Mr. Fuller has assem-

bled a large amount of local antiquarian lore from diverse sources, which later are indicated in forty-two pages of bibliographical notes. With scarcely any exceptions, and those unimportant, the references are all to material already in print, so that the work is a compendium rather than one of original research. This may detract from its importance but not from its usefulness. Except for an enthusiastic Northwesterner the book would be rather heavy reading in any case, but the publishers have made it formidable by small print, long lines, and physical weight.

Four Cents an Acre. The Story of Louisiana Under the French. By Georges Oudard. Translated by Margery Bianco. Brewer and Warren. \$3.50.

One fears that Georges Oudard is one of those writers who have set out to make history "interesting." History is never otherwise when freed from pedantry and allowed to unfold itself simply and naturally. But when you try to make it "vivid" and "colorful" and "picturesque," you often make it murky and you are apt to make it untrue. It is hard to follow the thread of Mr. Oudard's story, and his failure to connect old names of places with existing ones sometimes makes his geography hazy. His sins against truth are not so much actual misstatements—although he puts the second big fire of New Orleans in 1792 instead of 1794—as distorted emphasis. He entitles his chapter on the voyage of Jacques Marquette and Louis Joliet, *The Discovery of the Mississippi*, dismissing lightly the finding of the river by De Soto more than a century earlier, on the ground that the Spaniards stumbled upon the Father of Waters by accident while looking for something else. What would the author say of Columbus, who bumped into the Western Hemisphere by chance when in search of a route to the East Indies?

Ten Years of World Cooperation. Foreword by Sir Eric Drummond. Geneva: Secretariat of the League of Nations.

This volume of 467 pages has been prepared as "a simple record of the work done by the League during the first ten years of its existence." A brief introduction summarizing the history of the League and describing its organization is followed by fourteen chapters dealing with the work of the League as represented in the peaceful settlement of disputes, the organization of peace and disarmament, the World Court, the codification of international law, financial and economic cooperation, international transit and communications, health, social and humanitarian activities, intellectual cooperation, the mandates system, protection of minorities, the Saar territory and the Free City of Danzig, the financial administration of the League, and League relations with public opinion. As a compendium of information from which advocacy and propaganda have been carefully excluded, the book is heartily to be commended to any who wish to know what the League has done or the methods by which it operates. Its reference value would have been increased if the names of the principal members of the League staff and of the various commissions had been included.

Horace Walpole's Fugitive Verses. Collected and edited by W. S. Lewis. Oxford University Press. \$8.50.

This amounts to a collected edition of Walpole's poetry. As such it is valuable only for what it adds to our knowledge of the master of Strawberry Hill, whom Mr. Lewis has made the subject of several other compilations for connoisseurs. The poetry in itself is sad enough; but each little piece, placed by Mr. Lewis in its setting in the correspondence or elsewhere, becomes a memento of the master, and as such has its real though often rather absurd charm.

SOS**

ON this, the third anniversary of the talking picture ("The Jazz King" startled the world in the summer of 1928), I find myself quite unable to offer the usual congratulations. The promise the talking picture held out at its birth of growing into something worthy of public respect and even admiration has not been fulfilled. Today it looks so utterly sick both in body and mind that unless some drastic change takes place it seems destined to drag on a miserable existence as a deformed and blabbering half-wit.

In saying this I do not mean to suggest that I greatly miss its elder brother, the Hollywood silent picture, whom it dispatched into limbo with such childish unconcern. On this point the situation was summed up pointedly about a year ago by Mr. Rex Ingram, the well-known director of "The Four Horsemen of the Apocalypse," who expressed himself in these words: "Silent films are finished—and a good thing, too. The plain truth is that the motion-picture industry was like a man dying of anemia . . . Everybody has been doing the same old thing. There was nothing fresh to do. You had the same old stories and, with trifling alterations, the same old situations; and you could do nothing more with them."

This needs but one qualification. If the motion picture resembled a man dying of anemia it was not because of the silence of the silent picture, but because of the moronic standards of film-making that Hollywood considered the alpha and omega of cinematic wisdom. One notes two significant facts. In Soviet Russia for the past three or four years the silent picture had attained a level of artistic expression that had made it the most vital and widely acclaimed contribution to the art. By contrast, in this country the silent picture had lost favor with the public long before the sensational arrival of the talking picture. It was a fortunate thing for the Hollywood movie lords that the talking picture arrived when it did. It caught the imagination of the public and regained for the movies their lost ascendancy. But Hollywood never learned its lesson. It has treated the talkie as shabbily as its silent predecessor, and today it is reaping the results of its stupid and shortsighted policy in the growing indifference of the public and the threat that this implies to its financial returns.

Is the situation then so utterly hopeless? I believe it can still be saved, but this needs an enlightened policy on the part both of the producers and the public. It seems almost incredible that of all the big industries in this country the movie industry is practically the only one that conducts no organized artistic and scientific research. A new idea in film-making must be presented in a complete and finished form before the producers will condescend to look at it. And the cost of making a film being usually beyond the means of an individual worker, this attitude virtually destroys all chances of any original conception ever being tried and developed for practical use. The producers must realize that what is at stake today is the prestige of the movies itself, and there is no way of maintaining that prestige except by encouraging, if only on a small scale, untrameled artistic and scientific effort, and by cultivating, even if it does not result in high profits, the support and interest of the discriminating minority of the public. The latter for its part can help to save the movies. All it needs is to make its disaffection and demands sufficiently vocal. One of the ways of doing this is to form a genuine public organization on the lines of the Film Society of London.

THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York. British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London, W. C. 1, England.

THAT THE BANK OF ENGLAND has had to come to the Federal Reserve Bank of New York, and especially to the Bank of France, for a joint credit of \$250,000,000 was probably not the most pleasant news for proud Englishmen to swallow, but the credit should at least stem the outward flow of gold and establish London confidence securely again. So securely, indeed, that some bankers do not even believe that any part of the credit will have to be used. The credit, it is worth pointing out, was granted practically without hesitation, by direct negotiation among the representatives of the banks and without the need of any seven-power conference of ministers. The Germans may perhaps be forgiven for wondering why a similar credit could not have been established in favor of the Reichsbank. The credit to the Bank of England, it is true, was necessary partly to enable London bankers to leave their balances in Germany, and so helps the Reichsbank indirectly, but more direct help is obviously necessary.

MEANWHILE THE GERMANS have been showing an admirable spirit in attempting to meet the crisis unaided. The raising of the Reichsbank's discount rate to 15 per cent, and of the rate on loans against collateral to 20 per cent, is a Spartan move. But such rates are strangulation rates; few industries, particularly in a time of grave economic depression, can stand them for more than a very

brief time. How effective such staggering rates will be, and how the German banks will meet conditions after their reopening, may be known within a few days. It remains true that a prompt granting of a foreign credit several weeks ago would probably have prevented the present crisis altogether, and that such a credit could still be instantly effective. It would have to be perhaps twice as large as the credit to the Bank of England; instead of running for only three months, it might have to be an intermediate credit to run as long as two years; but if it were extended, it is highly probable that, as with the credit to the Bank of England, confidence would be so restored by the credit itself that very little of it would have to be used. The bankers who refuse such a loan through mere political—rather than economic—timidity will be taking a very grave responsibility upon their shoulders. Meanwhile one very reassuring fact has been the appointment of a banker of the quality and breadth of view of Albert H. Wiggin, chairman of the board of the Chase National Bank, to serve as the American member on the committee organized by the Bank for International Settlements to examine into the question of Germany's immediate credit needs.

NICHOLAS MURRAY BUTLER has again spoken out admirably in an interview sent from mid-ocean by wireless to the *New York Times*. He, too, declares that the disarmament conference of next February must not fail, and he asserts that public opinion everywhere is so far in advance of governments that it will not be permitted to fail. Nothing could be truer than his declaration:

The world needs no conference of military and naval experts, bent on balancing one equipment and one resource against another, but rather a conference of farsighted and constructive statesmen and men of affairs, who firmly intend to see that this broken world is rebuilt, and that quickly, before it is overcome by a new and perhaps fatal disaster.

This leads us to point out the necessity of peace advocates busying themselves at once with the question of the personnel of the commission to be appointed by Mr. Hoover. In the first place, every naval and military expert should be left in Washington. In the second place, Mr. Hugh Gibson should be permitted to fulfil his duties as Ambassador to Belgium. In the next place, the delegation should be headed by men who really believe in disarmament, and are prepared to go through with it. We trust that the President will send no more Joe Robinsons or Dave Reeds. We earnestly urge upon him the appointment of Senator William E. Borah, Chairman of the Senate Foreign Relations Committee, as one eminently fitted to lead, and with him should be associated Nicholas Murray Butler.

IN THE SUMMER OF 1914 Hermann Müller, then a rising young Socialist leader, risked his life in trying to bring the French and German Socialists together in opposing the World War. He traveled secretly to Paris only to have his overtures spurned by the French Branch of the party. He returned to Berlin disillusioned and joined with

the majority of his party in supporting the German war program. Had Müller, later twice Chancellor of the German Republic, succeeded in his mission, the war might have been prevented. It is inconceivable that either of the two governments could have carried on without the support of the great masses of working people represented by the French and German Socialists. Since the armistice the two parties have again been drawing closer together. Their leaders have become increasingly aware of the necessity of presenting a united front against war, and are more and more desirous of not repeating the mistake made in 1914. This was once more demonstrated at the recent sessions of the Socialist International in Vienna. Otto Wels, chairman of the German party, emphasized the need for solidarity. But more encouraging were the reply of Alexander Bracke, a French representative, who pledged the support of the French Socialists in opposing war, and the statement of Senator de Brouckère of Belgium, who declared that "it is not enough to hate war," but that the means and causes of war must also be attacked. He urged the party to "fight for disarmament and against the war danger." We fervently hope that the working-class leaders of Western Europe will remain as determined in their stand for peace should hostilities actually be threatened as they were in speaking from the comparative safety of a Vienna conference hall.

BRITISH JUSTICE, swift and unusually sure, is at its best in the case of Lord Kylsant, just sentenced to twelve months in jail for having issued a false prospectus "with intent to induce persons to intrust or advance property to the company." No sooner had the jury brought in its verdict of guilty than sentence was passed upon this man who until now has been one of the greatest figures in English business life. His offense was committed when he was at the head of the greatest combination of shipping lines ever brought together. To imagine an American analogue one would have to visualize a man of the type of James A. Farrell, head of the United States Steel Corporation, or the president of one of our great railroads, standing in the dock. What Lord Kylsant did was to permit the issuing of a prospectus which presented a favorable status of the Royal Mail shipping combination without making it clear that some of the amounts which made that favorable showing possible on paper had been taken out of secret reserves. The judge took a grave view of the crime, saying: "If it became known to the world that the balance-sheets of English companies could not be relied upon, it would be a very serious thing for this country." In sentencing the noble lord he told him that his offense was "very grave and very serious," so that he could not give him leniency. The speed of British justice is exemplified by the fact that Lord Kylsant's preliminary examination in the Lord Mayor's Court of London occupied only a few days, and that the whole trial of this extremely important and difficult case, which involved also the auditor, who was acquitted, took exactly nine days from beginning to end.

FREEDOM AT ANY COST is the demand advanced by Emilio Aguinaldo for the islands he once sought to defend against American aggression. This is the spirit in which the American Revolution was fought. It is the spirit in which any movement for liberty or independence must

be carried forward to succeed. Aguinaldo does not blind himself to the possibility that independence for the Philippines may bring violence and bloodshed. But, he said, in replying to a questionnaire sent him by Senator Hawes of Missouri: "Civil wars and uprisings have in many cases been the price which independent peoples have had to pay in order to consolidate their institutions." Yet the noted rebel is not so headstrong as this statement seems to suggest. He would work out logically and carefully the various problems involved in the granting of independence. For example, he suggested to Senator Hawes that the present free-trade relationship between the Philippines and the United States be maintained for a period of five years after the islands are set free politically. This would give the Filipinos an opportunity to solve some of their more important economic problems under the protection of the United States but without at the same time being hampered by American politicians, as they are at present. Any other course would be very likely to prove disastrous. We owe it to the Filipinos that they be not set helplessly adrift. We are in duty bound to assist them as best we can. But their political freedom must come first, and this means our complete abstention from political interference in their domestic affairs.

THAT IS A MOVING APPEAL which Miss Josephine Roche, the president and majority stockholder of the Rocky Mountain Fuel Company of Denver, has made to John D. Rockefeller, Jr., in protest against a reduction of 20 per cent in the wages of the Rockefeller Colorado Fuel and Iron Company:

One word from you can prevent a recurrence of the human and economic waste which will result from the action taken by your company, the Colorado Fuel and Iron Company, in cutting miners' wages 20 per cent. For forty years industrial conflict has periodically broken out in Colorado as a result of similar attempts to secure operating profits at the sole expense of workers. Following the Colorado loss of life and property in 1914, which culminated in the Ludlow massacre, you widely advertised a new industrial program by public assurances, which now take on fresh importance, to the effect that conditions leading to industrial upheaval in Colorado would never recur. But the causes of industrial unrest were not removed, and the traditional and anti-social methods of the past are being again employed by your company.

Miss Roche correctly adds that the disorganization and chaos of the coal industry cannot be cured by forcing labor to take lower wages and "by sidestepping the responsibility for correcting operating and marketing abuses," which responsibility in the last resort rests upon the owners. We have a great deal of admiration for John D. Rockefeller, Jr., as a public-spirited citizen staggering under the most grievous burden of wealth ever put on an individual's shoulders. But we cannot understand his refusal to go to Colorado, to see for himself the condition of his employees and to study on the spot the conduct of his operating officers.

HENRY FORD has shut down his Detroit automobile factories almost completely. At least 75,000 men have been thrown out of work; they have been given an unwanted summer "vacation" without pay. Press dispatches say that the plants may be reopened within a few weeks. But to what sort of wages will the men come back, if and when they do

come back? To the high wages of which Mr. Ford has so proudly boasted in the past? Apparently not. Although the newspapers say nothing of it, information reaching us from a reliable source in Detroit suggests that even the much-advertised Ford wage scale is to be slashed as a result of the depression. "The men now laid off," our correspondent writes, "are laid off permanently. That is, their badges have been taken from them. When, and if, they are rehired it will be as new men at \$6 a day." In other words, Ford wages are to be cut, but the fiction that they are not will very probably be preserved. More ominous news from the Detroit sector is contained in the reports of rioting at the Ford plants. Three such riots, in which machinery was destroyed and open fighting followed, took place when the present lay-off began. This is the first time that the Ford workers have struck back at the management. It is a symptom whose significance cannot be overlooked, despite the fact that the daily papers saw fit to ignore the news.

AL CAPONE, on the eve of going to prison for violation of the federal income-tax and prohibition laws, has come out flatly against gang movies for the young. Clad in black-and-white silk pajamas, the former beer king delivered himself as follows:

You know, these gang pictures—that's terrible kid stuff. Why, they ought to take all of them and throw them into the lake. They're doing nothing but harm to the younger element of this country. I don't blame the censors for trying to bar them. . . . These gang movies are making a lot of kids want to be tough boys, and they don't serve any useful purpose.

Before the exquisite irony of this we bow our heads without a word. Or almost without a word, venturing only to observe that the heart of the younger element of this country must be sore at such unkind words from one of its heroes. Nor are the movies alone dangerous. "I've been offered \$2,000,000 to write a book, but I won't do it," Mr. Capone went on. "I've had lots of offers from moving-picture producers, but I feel about that as I do about books." Moreover, when he gets out of jail, Scarface Al promises he will say "goodby to the racket" for good. And he finishes up his role of Robin Hood, gentleman outlaw and protector of the young, by remarking:

I've been made an issue, I guess, and I'm not complaining. But why don't they go after all these bankers who took the savings of thousands of poor people and lost them in bank failures? . . . Isn't it lots worse to take the last few dollars some small family has saved—perhaps to live on while the head of a family is out of a job—than to sell a little beer, a little alky?

How about it, boys and girls? Don't all speak at once, but isn't it?

WHAT'S WRONG WITH THE COLLEGES was not the title of the addresses Dr. Clarence C. Little delivered recently at Columbia University, but it might have been. Dr. Little, formerly president of the University of Michigan, finds that everything, beginning with the faculty, is wrong. Faculties are lazy, uninspired, interested in anything but teaching, and need a "cold shower" every five years to make them change some of their "academic clothes." Students are in the first place admitted to college without

any effort being made to find out what sort of boys and girls they are, and they are permitted liberties, once they are enrolled, which defeat the purpose they come to college to fulfil. Alcohol, automobiles, and coeducation are the main evils; fraternities and almost professional athletics are only a little less dangerous. Dr. Little's ideal is evidently the time-honored one of the university group, both of faculty and students, assembled for the purpose of getting educated. He should have observed by now that American colleges are not wholly designed with this end in view. American colleges are training schools for American business. Students enter them to learn how to make a living in a hard-boiled, machine-made, twentieth-century civilization. For "education" in Dr. Little's sense they have small need and less desire. A monastic four years spent in seclusion with their books would not teach them to "make contacts," any more than it would to sell bonds or to write advertising copy. And sensibly enough, the vast majority of American college students get from college just what they find useful later on.

"A MAN HAS AS MUCH RIGHT to be a Communist as a Democrat, and a Communist ought to have as much freedom as a Democrat. I say, however mistaken in his views a Communist might be, he should have an equal right to persuade others as long as it is done peaceably." We wish that this sentence might be posted in large letters in the office of every mayor and police official in the United States. It is only the sound American doctrine; indeed, it is the age-old doctrine of human liberty which is thus restated, but is, alas, constantly being violated under the Stars and Stripes. These words come not from any "parlor pink" editor, or any dangerous radical. They come from a judge in New Jersey—Vice-Chancellor John O. Bigelow. Chancellor Bigelow is not one of those who believe that in times of unrest one should soft-pedal as to the right of free speech lest hot-heads make ill use of political unrest and economic suffering. The case that came before him was obviously a very clear one, yet there are judges in the country, we regret to say, who would have turned a deaf ear to the plea. Albert Hoffman, a Communist candidate for the New Jersey Assembly, appealed to the Chancellor for a writ of habeas corpus because he had been arrested merely because he had applied to the police of Jersey City for a permit to hold a street meeting. That sounds incredible, but it is true, the police of Jersey City having made a crime out of a legitimate request.

WILLIAM L. McLEAN, the publisher and owner of the Philadelphia *Bulletin*, whose death occurred on July 30, created one of the most successful dailies in the United States by wholly unspectacular methods. It cannot be said that the *Bulletin* is over-well informed, or over-intelligent, or able editorially. It is just the kind of paper to make a middle-class appeal—clean, dull, bourgeois, conventional—with the result that it has achieved no less than 558,000 readers. If it has no vigorous opinions, it is admirably independent politically both of the local Vare machine and of the Republican Party in the State, as it is of the department stores in spite of their heavy advertising. Like its late owner, it seeks to offend no one, and takes life as it is, gently without much concern. Yet it is a good and decent daily, exerting a tremendous influence, and it is popular, as was Mr. McLean himself wherever he went.

Mr. Hoover, Call Congress!

THE President has at last moved in the direction of preparing for the grim and menacing winter which lies before us—only to the extent, however, of conferences with the head of the Red Cross and with the Secretary of Labor. It will surprise no one to learn that he is unyielding in his opposition to any federal aid to the unemployed, that he still firmly believes that unemployment relief "is essentially a local concern," and that "responsibility for its administration must rest with the affected communities." Why, then, does he concern himself at all with the matter? Merely because he believes that the federal government is "an effective coordinator of local effort"—we quote from reliable press dispatches. With Mr. Payne of the Red Cross—who refused to aid the destitute miners because their situation was not caused by any "act of God," but who is willing to work (though not to give money) for the general unemployed, apparently on the theory that a beneficent God ordained that our workless millions should go hungry and jobless—the President took up the question of "better coordination of all federal, State, and local unemployment agencies." With Secretary Doak he discussed not only this but the much-heralded reorganization of the federal employment service in the Department of Labor, which rebuilding we had thought finished long ago.

All of which is mere trifling with the gravest social issue the country has confronted in generations. It may be an engineer's way of preparing for a dire emergency; it strikes us as wholly beside the mark. It is admitted in Washington, by the spokesmen for Mr. Hoover, that while "there is nothing alarming about it, the unemployment situation will be very serious." The fact is that it would be extremely serious if there were to be no increase whatever, but there is every evidence that there is bound to be a great increase as companies which have held out so far find their reserves exhausted, their markets steadily decreasing. It is highly significant that Mr. Ford has shut down his great Detroit works for August and that only eleven of the thirty-six Ford assembly plants throughout the country will be in operation. In the face of what is plainly impending it is Mr. Hoover's paramount duty to call Congress in session in the early fall. The Congress still in considerable measure voices the opinions of the electorate. It was intended under our system that it should deal with the vital problems of our political and economic life. This is a first-degree emergency which confronts us; Congress should meet in September.

We are well aware that Mr. Hoover is opposed to calling Congress for the precise reason for which we think it should be summoned: he does not wish Congress to deal with the unemployment situation. He knows that when Congress meets, it will be hostile to his ideas; that it will be from the outset opposed to his halfway measures. He knows that when Congress assembles he will be called upon for a positive program all along the line. He has not met this test in the past—he will in all probability not meet it whether Congress meets in September or December. None the less, it is his patriotic duty to summon the national legislature, and the duty of statesmanship as well. If the new Congress

does not come together until December it will find the winter, with all its hardships, upon us. It must then organize and reconstitute its committees. The House must choose a new Speaker; its almost equal division between the two parties will render this reorganization difficult indeed, so that 1932 will be upon us before the Congress functions.

We are well aware that Mr. Hoover proposes to do a good deal of work for relief—perhaps through a new organization—before Congress assembles. He doubtless counts on the deficit and the impending Presidential election to help him in his effort to prevent any "radical" legislation. We reply that the suffering today among farmers, miners, textile workers, and numerous other groups is so grave that it is idle to think that any amount of Presidential initiative and coordination or reorganization will supply the aid needed, and that he will himself face a dire punishment if that suffering continues. On leaving him Mr. Payne again declared that unemployment "is a local problem, pure and simple." But what, we ask, is starvation? Is that a municipal problem also? Who is helping the starving miners except inadequate volunteers? Who is going to look after the Middle Western farmers like those in Kansas who are facing absolute destitution? We deny that local aid will do it, and we demand that the national legislature meet at once and stay in session to deal with each emergency as it arises.

It is not necessary to be an alarmist in the matter. The signs of warning appear day by day, so that he who runs may read. The Colorado Fuel and Iron Company, the Rockefeller company, has cut its workers' pay from \$6.25 to \$5.25 a day, and so has every other company in the State of Colorado, save one. The progress of deflation of wages goes on apace. Secretary Lamont has had to admit the right of companies on the verge of disaster to cut wages, and that situation is not altered by the fact that the President immediately thereafter had the announcement made that the policy of the government in regard to wage cuts had not changed. Whole industries are becoming demoralized. For example, the Governor of Oklahoma has notified the President that if oil sells below a dollar a barrel he will shut down every well in the State (except "stripper wells"), and declares that "if necessary we will use the military to enforce the order." Not sufficient attention has been given to the report of the Lumber Survey Committee, which presents the blackest possible picture of the lumber industry, and calls for immediate restriction of production—a step already taken by leading mills at the risk of prosecution. The condition of the entire oil industry needs no further comment. The railroad situation is not improving; the officials of the Delaware and Hudson, the Southern Railway, and other large companies have either voluntarily cut their salaries or had them cut. For the President in the face of all of this to limit to himself the power to guide the destinies of the country for four months more appears indefensible. More than that, as the recent outburst of Senator McKellar has shown, every day that he delays ratification of his European debt moratorium increases the danger of serious opposition to that admirable measure of world sanitation.

Murder in New York

THE latest gang row which resulted in the death of a five-year-old boy and the serious injury to four other children ranging in age from three to fourteen years may at last arouse the people of New York City to a serious consideration of the conditions under which they live. Even gangsters, it is reported, frown on the murder of little children, and the police, while almost willing to admit their helplessness in the situation, nevertheless advance the opinion that the shooting was done by amateurs unused to gangsterism or to the deft employment of firearms. So far no one has been held for the shooting; various persons have been questioned, all of whom present air-tight alibis. The neighboring Sicilians on West 107th Street, where the children were shot, are heavily schooled in a tradition of silence after trouble. They see nothing, they hear nothing, they suspect nothing. Or at least they will not impart their suspicions to the authorities, for the very good reason that death, in their experience, so often awaits the "squealer." Mayor Walker at first treated the matter with his usual frivolity. Questions put to him by the *New York World Telegram* were evidently designed "to embarrass me," but "the only thing embarrassing me is the heat." And when urged again to comment on the matter he said: "I naturally feel as everyone else does about it and I feel that Commissioner Mulrooney will handle the investigation satisfactorily."

The vulgar callousness of these remarks may be passed over, but with respect to Commissioner Mulrooney's ability to handle the situation, a glance at the *New York Times* "Index" for the month of June passed makes illuminating reading. Running one's eye down the column of Murders—New York City, one reads at random the following items: Brivanzano, F., slain, June 29; J. J. Cerbara [slain], man held, June 28; De Rosa, L., victim of gang feud, June 4; Jacaparo, J., called beer-racket victim, slain, June 9; Rosenberg, A., slain, believed to be another victim of liquor-traffic feud, June 17; Sattler, C., gangster, slain, I. Gold, passerby, injured, June 23; Soricelli, J., slain, refuses to name assailants, June 22; Zaccarelli, J., slain, I. Morzia dies of wounds, June 30; Atarati, G., slain, four others injured, June 1. In other words in one month in New York City fifteen men were killed or injured by bullet wounds in the course of gangster fights, in almost every case at the hands of "unknown assailants." This is not, be it remembered, the complete list of homicides in the city during June, 1931; it excludes all but those most clearly the work of gangsters warring on gangsters. Under these conditions it was inevitable that sooner or later innocent persons should suffer, and in a crowded street in one of the poorer sections of the city on a hot summer night one need hardly be surprised that the victims were children.

Commissioner Mulrooney makes one excellent suggestion in respect to the affair. "This ought to wake people up," he said, "and teach them that there must be more adequate laws governing the sale of pistols, shotguns, and rifles. . . . As long as weapons that are outlawed in one State can be readily got in another, there will be happenings of this sort." It is true, of course, that the easy purchase of firearms results in gang fights that end in murder. But before

effective federal supervision of the sale of deadly weapons can be brought about, what shall be the function of the New York police? Are they, as they seem to be, quite helpless to prevent almost daily murder in the city? Is there no possible control of racketeering and gangsterdom in New York? Must the city face the fact that its police department is powerless to insure the safety of its citizens while every sort of racket flourishes? If this is so, then New York might save a large amount of the taxpayers' money every year by abolishing its police force, and giving itself over frankly to the tender mercies of the gangs.

The shooting of these five Italian children is a challenge to the city administration. It is not comforting in such an emergency to have a mayor who divides his comments between wisecracks about the heat, meaningless confidence in the Police Commissioner, and orders to "shoot to kill" anybody suspected by the police of being a criminal with a gun. There is a fairly general impression, among the people of New York, that the police know pretty well all the rackets that are going on and a number of the persons who are engaged in them, but that for some reason they are powerless to interfere. It is Commissioner Mulrooney's duty to dispel such a notion in one of two ways: either by promptly bringing the perpetrators of the latest outrage to justice, or by confessing his helplessness and giving up his job. Across the river in Jersey City he has an example of a local administration that keeps gangs down—or out. Although within a stone's throw of New York, Jersey City is practically free from gangsterism; murders are at a minimum, night clubs abolished. New Yorkers may well ask why this is so, and may ask meanwhile what is to be done to make their city safe to live in.

Rising Bank Failures

IN the six months ended June 30 of this year 684 banks, with total deposits of \$455,000,000, closed their doors. With the exception only of the last six months of 1930, when the total was brought up by the failure of the Bank of United States in December and the appalling number of suspensions all over the country in November as well as in that month, the figures for the first half of the present year are the largest for any half-year period on record. That a period of world-wide depression should precipitate a large number of bank failures may seem to many merely inevitable. But Great Britain, which has been passing through a period of post-war depression far more severe than our own, has been virtually free of bank failures. The disease from which our own banking system suffers, moreover, while it is more severe in bad times than in good, has already shown itself to be a chronic one—one that was making progress, indeed, even in the peak years of Republican prosperity. It is worth while setting down the record for the last decade, as shown in the official figures of the Comptroller of the Currency:

Calendar Year	Number of Banks Suspended	Deposits of Banks Suspended
1921.....	501.....	\$196,000,000
1922.....	354.....	111,000,000
1923.....	648.....	189,000,000

It is clear from this that there was a rather steady increase in bank failures even before the depression year of 1930, and that this increase occurred while prices of securities were being carried up to more and more extravagant levels. The bank failures of the last twelve months, therefore, can only in part be attributed to the present depression, and even these could in the main have been avoided if reasonably sound banking practices had been followed.

Our banking failures have often been attributed to our system of thousands of independent units. There are still nearly 24,000 separate banks in the United States—though through suspensions and mergers the number has been reduced by more than 5,000 in the last half-dozen years. As compared with this, Great Britain has about half a dozen great banks with thousands of branches. That many of our banking failures may be attributed to the small size of individual banks, there can be little doubt. The fortunes of these banks are tied very closely to the fortunes of local industries and local crops; such banks necessarily find it difficult to diversify their loans, to spread their risks, and to keep themselves liquid; and their overhead expenses are often excessive. It seems probable that there would be a real increase in stability in many sections if branch banking were more freely permitted for both State and federal banks. It is anomalous that widespread branches are permitted in virtually every other major industry or business in the United States but banking, where the confidence that large resources inspire seems peculiarly necessary. Under our dual system of State and federal banks, it seems advisable that no federal bank be allowed to expand beyond the lines of any one State, and certainly State and federal banks should be placed on an equality in this respect. Such an arrangement would provide most of the States with better banking service at the same time that it would prevent the great New York and Chicago institutions from securing any dangerous domination.

But that branch banking, though it should prove a stabilizing factor, is in itself no guaranty of banking safety has been amply illustrated by the failure of the Bank of United States and similar institutions with many branches within large cities. What is imperatively needed is a radical simplification and rationalization of our jumbled State and federal banking laws, and a concentration of supervisory responsibility. Even this will not provide more than a partial remedy unless our bankers learn to become less recklessly optimistic at the peak of business cycles, more skeptical regarding the permanence of "new eras." While there were 358 failures in the twelve months ended June 30, 1921, for example, there were only 49 in the preceding twelve months, and those 49 failures represented a larger number than in any of the preceding four years. It is clear, then, that the wave of bank failures which began in 1921 was in large part the result of mortgages placed on inflated land values, which in turn reflected a mistaken capitalization of war-time crop values. No State or federal supervision, however honest or efficient, can completely offset unsound banking judgment of that type.

"Shoot the Works" Together

HEYWOOD BROWN, to his capacities of newspaperman, crusader, politician, preacher, man-about-town, and generous friend to all the world, has added that of play producer. He also, one hears, calls himself an actor, but of that perhaps the less said the better. But he is indubitably a producer; nightly on Broadway his show is witness to it. Audiences, hard-boiled, typical, midsummer Broadway audiences, are paying good American money for admission. Young ladies in Mr. Brown's show dance like any other chorus girls; young gentlemen sing, delicately tap-dance up and down ladders, disappear under beds, and profess undying love for some of the young ladies. A regular Broadway show—but with a difference!

The difference is apparent on the stage and in the wings. There are acts in Mr. Brown's play that would appear on no amateur stage in the country, be it ever so "ham." There are other acts breath-taking in their skill, and one double-jointed young man who is probably not human at all, but an automaton jerked by invisible strings from above. His name does not appear on the program, which is characteristic of Mr. Brown's show. There are jokes which have not been told for years and then only in Pullman smokers. There is an easy, comfortable air of informality, made more so by the sight of Mr. Brown himself, dressed in his old blue suit, wandering on and off stage, a little helpless, a little apologetic, but smiling his own endearing smile. This is what the audience sees. Behind the scenes other strange things are happening. For this really is a cooperative show. They really do divide up the profits, and there really have been profits to divide. At the end of the first week the young ladies of the chorus got forty dollars apiece and sent a testimonial to Mr. Brown, declaring that never, never in any show had they been treated in such a gentlemanly manner. The principals, some of whom, it is said, would have sniffed at two or three times their salary in Mr. Brown's show, are taking one hundred dollars a week without complaint. One suspects that more than one act has been put on gratis. And the final curtain, which benighted producers of other musical shows spend thousands of dollars on, costs Mr. Brown just twelve dollars; it is not clear, at that, just what he spent the money for.

First-night critics were a little hard on "Shoot the Works." They were united in declaring politely that Mr. Brown's show was a worthy cause, but more than one of them sounded as if he agreed with Mr. Rathbun of the *Sun*, who advised his readers to support the cause by buying tickets—and giving them away. The fact is that Mr. Brown's show has a quality all its own. It is compounded of some talent, of a large amount of good temper and satisfaction, of not a little simple gratitude, and of Mr. Brown. This is not, one hastens to say again, because of his acting ability. If he has any, he has taken pains to conceal it, out of sympathy for certain of his colleagues. It is because, many persons have heard Mr. Brown declare, he really believes in the brotherhood of man. Even in a Broadway show this belief has a curious relevance and power.

France Against the World

By OSWALD GARRISON VILLARD

WHAT is the actual situation of the world today? Europe is on the verge of financial collapse because Germany hangs in the balance. To save the Reich, Mr. Hoover proposed and carried through the moratorium of one year, the best psychological effects of which were spoiled by a two weeks' delay due to French haggling over the proposal. Germany was further aided by the announcement, after the seven-power conference, that certain short-term credits would be frozen, but every effort to get the American banks together to advance a credit of \$500,000,000 failed—beyond question because of French opposition. Meanwhile, though there is conflicting evidence of what took place when the heads of the French Government met Chancellor Brüning and Foreign Minister Curtius in Paris, the fact remains that the French, who were in the best position to help Germany, have not done so. The rumors still persist, despite denials in the name of Premier Laval, that the French are refusing to aid unless Germany makes political concessions which will violate its independence and will cause the fall of any German Ministry which agrees to them. The next few weeks will tell whether the Germans can save themselves, or whether it will be a question of further help in order to save Europe and the capitalist system, and to prevent an unparalleled disaster in the United States.

Meanwhile, it is obvious to every man of affairs, wherever he may be, that the Young Plan is dead and can never be revived; that if Mr. Hoover made any mistake in connection with his moratorium proposal it was in not asking for a two-year debt vacation instead of one, since in less than a year from now the whole question of reparations and debts will come up again at the worst possible time—in the middle of an American Presidential campaign. More than that, the Versailles treaty is equally finished; it is so dead that it cries to high heaven for decent interment with the customary rites. But the French will agree to neither one of these accomplished facts. They refuse to admit that anything has happened to the Young Plan beyond a temporary postponement. If, as Briand has *twice* said, they consider the Austro-German customs union a cause for war, what will his Government not say to the man who declares the Versailles treaty is on the scrap heap? The whole hegemony of France hinges on that treaty; its whole system of satellite nations, so elaborately built up by force and subvention, by skilful playing of the financial cards among people in distress and in need, will collapse. The present vicious arrangement of Europe with which France is entirely content (save that its militarists still desire the left bank of the Rhine) will come in for a new deal—the Polish Corridor, Upper Silesia, and all the rest. Not Alsace-Lorraine, of course. There Germany is on record as having formally and permanently abandoned all claims—in my recent stay of six months in Germany I never heard from any source the suggestion that Alsace-Lorraine might be, or ought to be, recovered.

France will stand against any further help for Germany

—unless paid the price of political subservience. Against any reconsideration of the Young Plan—unless it is given a price—France will set itself with all its strength. Against any revision of the Versailles treaty France will throw all its power. More than that, France stands out today in all the world as the one country which opposes thoroughgoing disarmament—except on *its* terms. It wants every step taken to be from the point of view of what it thinks it needs and what it fears. No, not what *it* fears. I do not believe that of the French people. I should have said "what the politicians now holding office fear, or pretend to fear." I notice that every time Briand makes an intensely pacifist speech his hearers wildly applaud him. I notice that the press associations all report that the reception of the Germans by the crowds in Paris was remarkably friendly and generous despite some cat-calls. I notice that there is no real public opinion in France; that the masses have no way of making themselves heard. The provincial press is negligible. The Parisian press is about the worst in the world. Where it is not deliberately corrupt, it is under the influence of the financiers, or is entirely controlled by the Government. The American newspapers, which solemnly reprint the views of the French editors whenever any important thing happens, do a great injustice in not telling the American public that most of these journals represent crooked financiers, or crooked politicians, or crooked editors, or editors who take their orders—if not their pay—from the Government. Let nobody think that such as these represent the mass of the thrifty, home-loving, law-abiding, peace-desiring people of France. Nothing of the kind. It is no more possible to deduce from a *Temps* or a *Matin* article what Bretagne thinks of a world proposal than it is possible to gauge the feeling of the people of Kansas and Oregon by the editorial solemnities of the *New York Times* or *Herald Tribune*.

But there the situation is. *Every move now being made to rescue Europe encounters French opposition. Every hope of a favorable outcome of the disarmament conference, which is to set the world free from the slavery of armaments that hideously waste national resources and spell war not peace, is menaced today by the French.* There is the plain truth. We had a Tammany boss in New York once who, when the facts were revealed as to the rottenness and corruption in Manhattan, sat back defiantly, his black cigar in his mouth, his thumbs in the armholes of his waistcoat, and asked the citizenry: "What are you going to do about it?" Today, that is the question France is posing to the rest of the world. In the words of the jingo rhyme they say: "We have the ships, we have the men, we have the money, too." They have the largest fleet of fighting airplanes in the world. They have enough formidable submarines to keep England on the anxious seat. They have the largest and most effective army. They have huge gold reserves—so great that, like our own, they menace the stability of world finance. They owe no money to England, but England owes money to them. Their country is restored. Despite huge armament expendi-

tures their annual deficits are not alarming. They claim officially that they have only 35,000 unemployed when Germany has over 4,000,000, and we at least 6,000,000, and England 2,000,000. The effects of the world crisis are only felt in France here and there—in the bankruptcy of their leading steamship lines, in the severe falling off in the number of tourists, especially American, in incidental strikes and distress in certain trades like the woolen industry. Superficially they are "sitting pretty." The economic tornado has not hit them full force.

They are "sitting pretty." What are *you*, and we, going to do about it? The consensus of public opinion about France's dog-in-the-manger policy and its danger to the whole world was never more united—it is as united as public opinion in 1914 was everywhere in regard to the German violation of Belgian neutrality. Today public opinion outside of France is so wholly opposed to the French that it would be a shock to the good people of that republic if they realized it. Everywhere the belief is that France blocks the road to a genuine peace in Europe.

What are you going to do about it? When there was all that hullabaloo about the "Beast of Berlin," when our leading clergy and moralists were raving that Germany was the mad dog of Europe, the remedy suggested was to get America to apply, in Woodrow Wilson's words, "force—force without stint" and to complete the circle imprisoning the mad dog. That application of force was a miserable fizzle. It won no victory, it achieved no peace. It left us the horrible legacies of Versailles; it left us the conditions which have led to the present economic catastrophe of the world. It left us this very problem of France, for it transferred the seat of military power in Europe from Berlin to Paris without in the least changing its character, and once more we are faced with the problem of what to do with a country which is today outraging and defying the public opinion of the rest of the world.

What can we do? First, we can organize public opinion behind the governments which, like those of the United States and Great Britain, are determined that Europe shall not collapse and that the disarmament conference shall succeed. Mr. Hoover, Ramsay MacDonald, and Arthur Henderson have done splendidly in calling for disarmament. In both countries public opinion is rapidly being mobilized in their support. Wherever our public is approached, whether by individual speakers or peace caravans or in any other way, the public response is complete. Every one of our innumerable societies dealing with peace and international affairs is working as never before. So in England. Petitions in their most conservative universities have produced a unanimity of support for a cut of 25 per cent in armaments never before seen, never before possible. The press and public, and especially the women, are determined that the biased naval experts and the admirals shall not spoil this conference.

Second, there must be increasing outside public pressure brought to bear upon France—despite the difficulty of getting news through to the French people. Here the international bankers could help a lot—if they would dare to stand up against the Bank of France. They may yet be compelled to do what they now think impossible if Germany collapses financially and economically. Third, there should be pursued by the other governments a steady policy leading to the isolation of France, especially with regard to the dis-

armament conference. *The Nation* has already made the constructive suggestion that Great Britain and the United States should agree in advance upon a radical program such as the abolition of all poison gas, submarines, aircraft, and battleships, the limitation of all remaining ships (cruisers and the rest) to 10,000 tons, and of all guns to light field-artillery size, and a cut of at least 50 per cent in expenditures, this program to be urged and advocated at the very outset of the conference by at least a dozen Powers under Anglo-Saxon lead, exactly as Charles E. Hughes electrified the Washington arms conference in 1922 by offering a specific program the minute it met. This program, whenever decided upon, should be communicated *at once* to the French with all possible courtesy and good-will, with all possible urging that France, too, adopt it before the conference meets.

It is impossible to believe that such a move would not call forth the enthusiastic adherence of the vast bulk of the conference—it includes all the nations, even Russia—and it is also impossible to believe that if such a program were accepted by all save France and its satellites, France could hold out and definitely set its face against world opinion. Proof of that is to be found in its final acceptance of the Hoover moratorium. It will in any event haggle, bargain, growl, delay, and talk about its special dangers and problems. But it cannot wholly defy Europe, America, and Asia without facing world-wide excoriation and isolation. Like every other country it needs good-will; it must have it to progress financially and economically. More than that, if the rest of the world is ready to disarm radically, could any French Government defend itself to its own parsimonious citizens if it refused them a glorious opportunity to lift some of the tax burdens from their backs?

If France should then still refuse to disarm? Then (fourthly) let the other nations go on with their outlawing of battleship, submarine, and airplane. The generals and admirals will rave at such a suggestion and declare that it would make every other nation vassal to France. Nothing of the kind. No country would be allowed by its own citizens to use outlawed weapons upon peoples who would refuse to fight back in kind.

But, fifth, if the latter proposal sounds too idealistic, there are ways of organizing against France, and to these it may be necessary to turn. There is the League of Nations, for one thing. It is impossible to believe that it would rest supine under such circumstances, for, if it did so, it would admit the correctness of the frequent charge made against it that it is under the control, or controlling influence, of the French. The vital stake the League has in the disarmament conference may be realized if one remembers that upon its success probably depends the question whether Germany and the other disarmed countries will or will not remain in the League. As for the other signatories to the Treaty of Versailles, their honor and their words are in the balance. They pledged disarmament in that treaty. France may wish to have it known that her signature at Versailles has no greater value than a dicer's oath; the others do not and will not. The same is true of the signatories to the Kellogg Pact. Did they mean what they said when they signed that document, or did they not? If France insists on maintaining armaments which overawe the rest of Europe, the other great Powers have still another reason for making it clear

to France that they can no longer stand for any such policy, especially as it is, economically speaking, a rule or ruin policy. The world has a right to demand of France that it shall keep its word and conduct its relationships with other peoples upon the principle that it has forsworn war forever; not that, having taken a solemn oath to abstain from war, it shall go on conducting its international affairs as if it had never heard of the Kellogg Pact. Certainly it would not do a whit differently, if it had never signed the pact, than it is doing now. Why did the French sign the pact and praise it to the skies if it meant nothing to them and only encouraged them to continue to take counsel of their fears, to continue to arm and to hold a pistol at the heads of all the Powers in demanding the special terms and concessions which are deemed necessary for French safety—as if no agreement to abolish war existed?

President Nicholas Murray Butler of Columbia has just urged that Congress pass at once the Capper resolution introduced two years ago, making it possible for the President to use non-forcible sanctions or disciplinary measures against any adhering nation which violates the Kellogg Pact. This

resolution would permit both an economic boycott and the placing of an embargo upon shipments to any violator who goes to war. All of this has to do with the future. One cannot, however, but feel that something like a moral embargo must ere long come to pass if France should menace the whole future of the world and deliberately block the way to that disarmament which is one of the most vital steps toward recovery. Certainly something like this must have been in the mind of Noel Baker, parliamentary secretary to Foreign Secretary Henderson, when he told the Socialist Workmen's International at Vienna on July 28: "We shall proclaim every government which opposes disarmament a deadly enemy of mankind"—a remarkable statement from so responsible an official. As already quoted in *The Nation*, J. L. Garvin, the veteran editor of the *Sunday Observer*, declares that America and England will have to take separate action against French policy within three months. It is impossible to believe that in this most dire crisis in the world's history one nation will be permitted, through the incredible obstinacy, shortsightedness, and self-will of politicians temporarily in power, to block the rehabilitation of the world.

President Hoover's Record

VIII. Hoover and Power^{*}

By AMOS PINCHOT

II

TO understand the power situation, one should hold in mind that the power-and-light industry—and here it closely resembles the bootlegging industry—is essentially a racket whose immense profits depend on the power people's ability to block the enforcement of law. It is for this reason that the power interests have intrenched themselves in both State and national politics, and especially in the federal administration at Washington.

When Mr. Hoover became President, the three most important members of the Cabinet, from the point of view of the water-power companies, were the Secretary of War, the Secretary of State, and the Attorney General. At that time the Secretary of War had a peculiar importance since he also was ex officio chairman of the Federal Power Commission. In power strategy the Secretary of State is rated as a trump card. He is supposed to be thoroughly posted on water-power questions and to advise the President thereon. He negotiates our treaties with adjoining nations for the allocation of water in streams that cross our international boundary lines. He will negotiate the pending treaties with Canada for division of water in the St. Lawrence, Niagara, and St. Mary's rivers, and with Mexico for the Colorado and Rio Grande. As for the Attorney General, his influence in the power situation is especially vital. It is his duty to prosecute violators of the Federal Power Act and to move in the district courts for the forfeiture of licenses and the sale of the property of power companies that infringe the law.

True to his preelection record, Mr. Hoover intrusted the portfolio of war, which carried with it the chairmanship of the Federal Power Commission, to the late James W. Good, who was counsel for the Alabama Power Company, a subsidiary of the Southeastern Power Company, one of the strongest, most grasping, and politically most aggressive of the great utility combinations.

Last year, after the Federal Power Commission was reorganized and enlarged to five members by the Couzens bill, Mr. Hoover chose as its new chairman George Otis Smith who, as director of the Geological Survey, supported Secretary of the Interior Ballinger during the Taft Administration when he canceled the power-site withdrawals made by his predecessor, Secretary Garfield, and turned the immense power resources of the federal domain over to private exploitation. The day after Mr. Smith took office he dismissed from the staff of the Federal Power Commission Charles A. Russell, its solicitor, and William B. King, its chief accountant, who had offended the power companies by showing up their padded investment accounts, as well as by interfering with their attempt to destroy the Federal Power Act, in which, as we shall see, they were later aided by Mr. Hoover himself. The fact that these dismissals took place within twenty-four hours after Mr. Smith became chairman is generally accepted as proof that he was acting under instructions from the President.

In the appointment of the remaining members of the new commission, Mr. Hoover followed the same line by choosing negative men either with a laissez faire attitude or with a pro-utility bias, as in the case of Colonel Marcel Garsaud, a Louisiana Democrat, locally identified with the Public Service Corporation of New Orleans, a subsidiary

^{*} Part I of Mr. Pinchot's article appeared in last week's issue. The ninth article in our series of ten on President Hoover's record will be Hoover as Politician, by Paul Y. Anderson, and will appear next week.—EDITOR THE NATION.

of the Electric Bond and Share Company. It is true that the Senate confirmed these appointments. Upon further inquiry, however, into the records of the new commissioners, it uncovered facts which resulted in a resolution requesting the President to withdraw their names, which Mr. Hoover has, so far, refused to do.

As Secretary of State Mr. Hoover appointed Henry L. Stimson of Winthrop, Stimson, Putnam, and Roberts, one of the large utility law firms of New York. Mr. Winthrop was a signer of the brief presented to Congress in an effort to block Senator Walsh's proposed investigation of the power companies. Mr. Roberts has been a director of the Niagara-Hudson Power Company, the Pennsylvania-Ohio Edison Company, the American and Foreign Power Corporation, and the American Superpower Company, and vice-president and director of Bonbright and Company. Incidentally, Mr. Stimson's firm is counsel for the Georgia Power Company, which is controlled by the Southeastern Power Company. Moreover, the Federal Trade Commission developed the fact that Josiah T. Newcomb, head of the utility lobby, employed the Stimson firm to come to Washington and remonstrate with an important Western Senator who was attacking the power companies. Mr. Stimson, like Mr. Hoover, has endeared himself to the power interests by minimizing the importance of water power as a national industrial factor, thus discounting the need of federal regulation, and also by denouncing the Ontario publicly owned hydroelectric system. The National Electric Light Association has reprinted his speeches as part of their propaganda.

As Attorney General Mr. Hoover chose William D. Mitchell, a Minnesota lawyer, formerly of Butler and Mitchell, one of the most prominent utility law firms of the Northwest. Mr. Mitchell's former partner is now Justice Pierce Butler, who divides with Justice Van Devanter the reputation of being the most reactionary member of the Supreme Court. As Solicitor General of the Department of Justice, next in command to Mr. Mitchell, Mr. Hoover appointed Thomas D. Thacher, formerly of the firm of Simpson, Thacher, and Bartlett, counsel for the Electric Bond and Share Company and probably for more power companies than any other law firm in New York.

Another appointment of considerable value to the power people is the chairmanship of the Republican National Committee. As titular leader of the party and spokesman of the President, the national chairman is said to be influential in shaping the policies of the organization. This post Mr. Hoover gave to Claudius H. Huston, head of the Tennessee River Improvement Association, a lobbying agency mainly devoted to fighting the Norris Muscle Shoals bill.

In the record of Mr. Hoover's connection with the power companies, his interposition in 1930 in favor of the Electric Bond and Share Company and the great power and financial interests behind it, in the so-called New River test case, is by all odds the most interesting chapter. Strangely enough, it is a chapter which is comparatively unknown to the public. The salient facts in this remarkable episode are briefly as follows:

For some years the New River Development Company and its successor, the Appalachian Electric Power Company, a subsidiary of the Electric Bond and Share Company, have been trying to obtain from the Federal Power Commission two rulings which, though seemingly harmless, would never-

theless smash the Federal Power Act, cripple federal regulation, and ultimately place the power companies exclusively within State regulation, which, as shown in my former article, is in effect no regulation at all, since the State commissions are controlled in almost every part of the country by the utility interests. In a recent article Professor William Mosher, director of the School of Public Affairs of the University of Syracuse, describes the almost complete failure of State regulation from the public's point of view, and concludes: "It can hardly be said that regulation has been tried and found wanting. It may rather be said that it has not yet been tried."

To be mildly technical at this point, let me say that the Federal Power Act provides that every water-power development on streams controlled by the federal government must be made under license from the Federal Power Commission, which is authorized by the act to issue just two kinds of licenses. One is the ordinary, or "standard," license, under which the development is subject to all the regulatory provisions of the act. The other is the so-called "minor part" license, which exempts the company from federal regulation and leaves it in the hands of the State commissions. As shown by the bills introduced as well as by debates and correspondence prior to the passage of the act, and also by the terms of the act itself, the intention of Section 10, which deals with minor-part licenses, is perfectly clear. It is to exempt small plants of a few hundred horsepower, and additions, such as transmission lines, water conduits, etc., from the somewhat technical and complicated provisions of the Power Act. The minor-part-license clause was included both as a convenience to the power companies and to save the government from having to step in and regulate inconsequential projects and improvements.

When the Appalachian Electric Power Company applied for a minor-part license for its proposed development on the New River near Radford, Virginia, it was not primarily interested in the New River plant. Its real object was to establish a precedent which would eventually exempt all important developments from federal regulation. The New River project had not the slightest resemblance to the sort of thing contemplated in Section 10 of the Power Act. It called for the construction of an 80,000-horse-power plant, a dam 115 feet high, and a 20-mile reservoir that would flood about 4,000 acres. However, if enough pressure could be brought to bear on the Federal Power Commission to make it rule that this New River plant could operate under a minor-part license, and thus escape federal regulation, there was no reason why all plants on all streams at present under control of the federal government should not receive a similar license and enjoy a similar exemption. And in such event the power people would find themselves solely under State control, where they would be as happy as Brer Rabbit in his traditional briar patch.

Considering the nature of the proposed New River plant, the Federal Power Commission had no choice but to turn down the application for a minor-part license and offer the usual standard license. This the Appalachian Electric Power Company promptly rejected, and as its next move requested the commission to refer the matter to the Attorney General for an opinion. However, the commission once more stood by its guns, replying that a "reference of such questions to the Attorney General would not be appropri-

ate," since the commission was in the habit of deciding them itself, on consultation with its own counsel, and for the further reason that the question was one of fact as well as law, and the precedents of the Department of Justice permit the Attorney General to pass in such cases only on questions of law.

As a second string to its bow, the Appalachian Electric Power Company had also applied for a change in the classification of the New River from *navigable* to *non-navigable*. As outside the federal domain the commission has jurisdiction only over power sites on navigable streams, such a reclassification would put the New River development beyond the reach of federal regulation. Thus, by raising the question of navigability, the power people were seeking a new interpretation of the Federal Power Act by which, with the help of a friendly Republican Administration, they could drive through a general reclassification of streams which would, in effect, repeal the Federal Power Act and hamstring the commission.

Now, since the Federal Power Act's definition of navigable waters—that is to say, of waters or streams where power developments must be made under federal license—is the foundation of federal regulation, let us see what Section 3 has to say on the subject:

"Navigable waters" means those parts of streams or other bodies of water over which Congress has jurisdiction under its authority to regulate commerce with foreign nations and among the several States, and which *either in their natural or improved condition*, notwithstanding interruptions between the navigable parts of such streams or waters by falls, shallows, or rapids compelling land carriage, are used or *suitable* for use for the transportation of persons or property in interstate or foreign commerce.

The New River, as it happens, is "navigable waters" by both of these tests. It is not only "suitable for navigation," but has actually been used for this purpose. The State of Virginia has appropriated money for improving its channel. Steamboats have been operated on it. It has been classified as "navigable waters" for over a hundred years, declared so by Congress, the Supreme Court of the United States and the Virginia legislature. Consequently, the commission found it impossible to grant the company's request for reclassification, though its acting chairman dissented. And here, in the natural course of events, the matter should have ended.

To anyone familiar with the strange things that go on beneath the surface of high officialdom in Washington it would seem incredible that the power people could have seriously hoped to put through their scheme for the destruction of federal regulation, resting as it did on their applications for a minor-part license and a reclassification of the New River. The power people, however, knew just what they were doing and were by no means reckoning without their host. For at the precise moment when it seemed inevitable that the commission would wind the matter up by finally turning down both applications, a new factor was injected into the situation. This factor was the President of the United States, who, taking one of the most extraordinary steps in the history of Presidential administration, himself wrote to Attorney General Mitchell requesting an opinion both as to the propriety of granting a minor-part license and as to the navigability of the New River.

Mr. Hoover's letter bears the date of July 31, 1930.

On September 22, 1930, Mr. Mitchell replied, transmitting an opinion holding (a) that the New River is not a navigable stream under the terms of the Federal Power Act; and (b) that the Federal Power Commission "may, in its discretion, issue a minor-part license under paragraph 1 of Section 10." Incidentally, on the last page of this opinion Mr. Mitchell questions the constitutionality of the Federal Power Act.

Unluckily for the power interests as well as for Mr. Hoover, the publication of this opinion resulted in the submission to the Power Commission of two briefs in opposition to Mr. Mitchell's conclusions, one from ex-Federal Judge George W. Woodruff, representing the Governor of Pennsylvania, and another from Mr. Judson King, director of the National Popular Government League, signed by a number of disinterested attorneys, including Professor Felix Frankfurter of Harvard, Francis J. Heney of California, Herbert S. Ward, Henry T. Hunt, and others.

The Mitchell-Hoover opinion had put the Federal Power Commission under heavy pressure from both the White House and the Attorney General's office. On the other hand, the opposing briefs, the standing of the persons signing and submitting them, and the consequent publicity soon created a situation where it was clear that the commission could not yield to Mr. Hoover's dictation except at the cost of a major political scandal, especially as the briefs showed that the removal of federal regulation from the proposed New River plant would logically mean a similar removal from other developments now under control of the federal government, as well as the blocking of regulation on about eleven million horse-power yet to be developed. In fact, it would open the way to a raid on the public domain in comparison to which the frustrated oil grabs of Doheny and Sinclair were insignificant in point of money values involved.

From the embarrassing position into which Mr. Hoover's ill-fated move had thrown it, the Federal Power Commission made a none too graceful exit by once more refusing a minor-part license to the Appalachian Electric Power Company, which was acting not only for the Electric Bond and Share Company, but for the power interests in general. But at the same time it partly saved the face of the President, Attorney General Mitchell, and Solicitor General Thacher, who helped Mr. Mitchell draft the opinion, by refusing to pass on the navigability of the river and stating that this question should be referred to the courts. So that the end of the New River case is not yet.

On the whole, from Mr. Hoover's record as Secretary of Commerce and later as President, it may be gathered that he and the utility and power people, who are today the backbone of America's plutocracy, have been playing a game of mutual advantage for exceedingly high stakes. So far our great engineer has been the chief winner. He has received the Presidency, while through no fault of his, but thanks to the opposition of a few staunch men, the Federal Power Act has not yet been destroyed. However, that the power interests will ultimately succeed in breaking down the Power Act, and with it federal regulation, seems fairly certain. They are too rich and too well entrenched at Washington to be permanently checked. In the end federal regulation will go the way of State regulation. It will become the instrument of the power companies.

Feudalism in West Virginia

By HELEN G. NORTON

Charleston, West Virginia, July 31

E. H. GUNNOE of Prenter took his young wife to the Mountain State Hospital at Charleston on July 1, five days before the strike of the West Virginia Mine Workers' Union began. On Sunday a daughter was born to them and died a little while later. When Gunnoe was informed of this he asked that the Prenter camp ambulance be sent to Charleston to bring the corpse back. The mine superintendent refused to let it go, saying that the ambulance now belonged to "future employees" of the company. Gunnoe had worked only one day the week before on account of his wife's illness and had not even indicated that he was on strike. The ambulance had been bought last November by the miners themselves out of their burial fund for \$1,640, because many accidents occur in the mine and there is no ambulance nearer than Charleston, twenty-two miles away.

On Tuesday Gunnoe got a man to go in his car to get the baby's body from the undertaker. When it came, his two boys, seven and nine years old, wanted to see their little sister. He opened the casket and found that the baby had not been prepared for burial—had not even been washed. Presumably the arrangement with the hospital and the undertaker also applied only to "future" employees.

A man from Cedar Grove tells about an eighteen-year-old boy who had quarreled with his family and gone over the mountain to get a job in the mine at Blakely. He didn't ask what pay he was to get. At the end of the week he had earned ninety cents and owed his landlady one dollar. He went out on the mountain the next day, the Fourth of July, and blew his brains out.

The scales of the Coalburg-Kanawha Mining Company at the Coalburg mine broke on April 14 and have not been repaired. The weighboss claims he can guess the weight of a 5,000-pound car of coal within 25 pounds. At Prenter, where the men gained the right to have a checkweighman as the result of a strike in April, the recorded weight per car (the basis on which the men who hand-load the coal are paid) has increased by 1,300 to 1,500 pounds. If a man loads fifty cars in two weeks, this means on the average 70,000 pounds which he had been cheated of previously—amounting, at 34 cents a ton, to \$11.90 per pay slip. And \$11.90 is not to be sneezed at when otherwise you make \$34.60 for two weeks' work. At Tipple Number 5 of the Burnwell mines no scales are used at all, the State law to the contrary notwithstanding. Men are credited by guess for their work. Of another mine, one man said, "They shoot them cars acrost the scales so fast the balance never has a chanst to stop swingin'." A man was fired last year at the "Christian" Collieries Company for showing 1,923 record sheets when cars weighed 6,000 to 6,500 pounds with a union checkweighman to watch the scales. Now the same sized cars, heaped up, are credited to the men at 3,500 to 4,000 pounds. The State law providing for checkweigh-

men is a dead letter. Miners now have to load "bug dust" after the machine has cut the coal, bail out water, and clean up without pay. This may amount to as much as two hours in the day in some workings. They also complain that they are docked excessively for slate and dirt in their loads.

Lester Davidson, a Negro, secretary of the miners local at Mahan, tells his story:

"When the strike come a-Monday I'd been readin' the papers and knowed about it and I didn't go to work. Charlie Hariston, he rooms with me, he was the first to join and I was next. Lewis Williams signed up seventeen Monday night. We held a meetin' and the boys elected Hariston president and me vice-president and Walter Fields, they made him secretary. We got our charter.

"While we was havin' our meetin' Thursday night the superintendent got the law and come down and arrested Hariston and put him in jail. He's still there."

"What was he arrested for?"

"Why, for attendin' the meetin'."

"Yes, I know, but what was the legal charge?"

"Oh! Trespassin'. You see, the comp'ny, hit owns all the land and I reckon the air too, so if hit don't like you, you is trespassin'."

"We got a check for \$50 from the union for supplies for our hongry folks and brung them to my house. So then the superintendent got a warrant out for me for headquarterin' and trespassin'. So I gits out and comes down here to report to the union. They ain't no trains and nobody had a car so I lit out an' walked to Pratts—sixteen miles—an' caught the bus to Charleston. The boys all chipped in an' got enough money for the bus fare.

"What we needs at Mahon to bring the mens out is a march. As soon as the union comes up thar and marches, the men'll lay down their tools an' walk out. They're all afeared their families 'll starve, but I tells 'em we're a-starvin' anyhow.

"When we got that \$50 for relief, we got sixty-seven on the union roll right away. And, lady, you should a seen what we bought for that \$50 at the T. and T. store! We got a l-o-n-g slab of white bacon, we got lard, we got meal, we got potatoes for \$1.20 a sack, we got flour for 69 cents a sack that cos' us \$1.25 at the company store. That 'pluck-me' store the company runs shore do rob us miners.

"The union is our hope an' our salvation and I'll starve like any natch'al man before I'll go back to work."

A woman from Ward who has come in for clothing shows me her husband's pay slip for the two weeks ending June 30. He worked 102 hours at 37½ cents, earning \$38.25. The company deducted \$22 for supplies at the company store, \$4 for rent, \$2.15 for doctor, hospital, and burial funds, and \$2.40 for gas. He already had an overdraft of \$37.79 for weeks when his earnings did not equal his expenses, so he still owes the company \$32.09. If he should die, this debt would be passed on to his son.

Deviti, an Italian, has been very active in the union organization campaign begun a year ago in March—so active, in fact, that the superintendent of the Hugheston Gas Coal Company fired him and gave him five days to get out of his house. Deviti has two small children and is expecting another this month.

On July 8 Deviti went to Cabin Creek to attend the hearing of his eviction case. While he was gone, the case was heard before a justice of the peace at Handley, the decision given to the coal company, and Constable Ottie Davis with a company truck and two State troopers went immediately to take the furniture out of the house and dump it on the public road or the creek bottom, which are the usual repositories of evicted households.

When Mrs. Deviti protested, Constable Davis kicked her and threw her to the floor in the presence of her two children. Deviti came home to find his wife in convulsions. The constable had called the company doctor and retired to the serene atmosphere of the company store. The company doctor offered to give the woman a "pill" to ease her agony, but the Devitis, like all coal-camp families, are distrustful of company doctors. They called in another physician, Dr. James A. Hopkins of Cedar Grove, who later signed a statement that he found her "having convulsions and threatened with a miscarriage." She is still in a dangerous condition.

Life in West Virginia coal camps is unbelievably feudalistic. The company owns the land. Therefore union miners may not walk upon it, even when the boggy, snake-like road through it constitutes the only means of access to the "holler" beyond. Even the railroad right of way is plastered with "No Trespassing" signs. At United there is a chain across the road and men with guards to see that no suspects, not even insurance agents, get by. The union recently arranged to have a meeting on the only piece of private property within range of the Koppers mine, owned by the Mellon interests. When union officials went up to speak they found that in the intervening week this land had also been leased by the coal company. No meeting was held.

The company owns all the houses in the camp. Therefore a union miner may be thrown out of his leaky, ramshackle piano-box on five days' notice, and the courts have even maintained that the usual landlord-tenant relationship does not apply to company-owned houses. Long before the strike a man who joined the union on Sunday would be fired on Monday, given a house notice, have his water and gas turned off, and his wages attached to pay his bill at the company store.

The company owns the doctor, though he is paid by semi-monthly assessments from the men's wages. Therefore a striking miner may not have medical care for his wife in childbirth though he has paid into the fund for years.

The company owns the store. Therefore a discharged or striking miner may not buy sowbelly or beans for his family or gas for his antediluvian car. At Ward the mine closed down several days in April, and the company store was closed too, to all miners who did not have credit. This left many of the people without food, and it was not until the following Sunday (Easter), when all the Ward miners marched to Charleston to petition the governor for help, that arrangements were made to reopen the mine and supply the

people with food on credit. The governor generously gave the miners \$10 out of his own bill-fold.

The company issues its own money. Therefore the miners often do not see real coins from one year's end to the next. Even Andy Mellon pays his miners in tin money with holes in it. This scrip is non-negotiable except as an independent merchant here takes it in at seventy-five cents or less on the dollar. On a movie house in Cedar Grove there is this sign:

	ADMISSION	
	Children	Adults
	15 cents	30 cents
Scrip	20 cents	40 cents

If a miner is single or if several in a family are working, they may earn more than they spend at the company store and receive cash for the difference, but most of the miners are hopelessly in debt to the company. Moreover, it is not "healthy" to trade elsewhere. At union headquarters there is a photostat copy of a typed list circulated among foremen showing how much each miner had traded as scrip with a note, "Give preference to the man who trades at the store." Prices are commonly 40 to 60 per cent higher at the company stores than elsewhere. One operator said, "Our mine isn't paying much but we make out pretty well with our store business."

The company owns the post office in 85 per cent of the camps. Therefore a miner who receives suspicious mail may be discharged. At United, now that the strike is on, people who live outside the camp but have their mail addressed there may not go in to get it.

It is against these intolerable conditions that the miners are striking, though ostensibly the strike is to compel the operators to agree to a conference with the union. Union checkweighmen and the right to trade where they please are the miners' most pressing demands. One mine whose manager has agreed to a conference is working with union permission. "It's the wrong time to strike," people in Charleston tell me. Well, any time is the wrong time to strike as far as I have been able to observe.

At any rate, the miners of West Virginia are striking, and the strike spirit is splendid. Lewis Williams, a frail old fellow with a face like a withered Genitan apple, walks seventeen miles up the creek through enemy territory to sign up new members, and then limps into Charleston to report to headquarters. There are others like him. "We'd sooner starve a-strikin' than starve a-workin'," they say.

Relief is the big problem. Eight thousand miners with large families wholly dependent on the union for food is no joke. Relief trucks are going day and night from the union's warehouse in Charleston, chugging over the mountains, jolting up the "cricks" and "hollers" where anxious crowds await the beans and flour and coffee they bring. The union can furnish only enough to sustain life, and it cannot do that long unless relief continues to come in from the outside and comes more generously than it has done. There is no question that, assured of freedom from starvation, the miners in even the "toughest" companies would walk out to a man. As it is, the union hesitates to call them out. The miners are desperate, and if they cannot curb the coal companies' depredations through union agreements, they may eventually use more violent means.

Decency and Prohibition Enforcement

By NEWTON AIKEN

WHILE the public has been looking for the much-advertised but hopelessly ineffectual Wickersham Commission to provide a formula by which the Hoover Administration might work out the prohibition "experiment" in the constructive manner to which Mr. Hoover pledged himself in the campaign of 1928, federal prohibition policy has been quietly but decisively reshaping itself under the hand of Amos W. W. Woodcock. A modest, studious man with eight years' experience in the prosecution of prohibition offenders as United States Attorney for Maryland, Mr. Woodcock took over the direction of the Prohibition Bureau on July 1, 1930, when it was transferred from its previous location in the Treasury to the Department of Justice. During his first year in office he has been effecting in practice the reform of prohibition enforcement which President Hoover so fondly expected the Wickersham Commission to outline in theory.

It is only fair to the Wickersham Commission to say that it paved the way for Mr. Woodcock's appointment by recommending the transfer of his bureau from its former to its present location; it may also be added that it was Mr. Woodcock's work as an investigator for the commission which first brought him to the front as a prohibition expert. In fairness it may also be noted that the new prohibition director has had the cordial support of his superiors at the Department of Justice in carrying out his policies and that he has enjoyed the collaboration of Howard T. Jones, who was Mrs. Mabel Walker Willebrandt's assistant and who now sits at Mr. Woodcock's right hand. But whatever part other individuals or agencies may have had, the primary responsibility for reform has been his and the initiative seems in large measure to have come from his own fund of experience.

Now that Mr. Woodcock has been in office a full year, the principal contours of his program are more or less clearly defined, and it is possible by use of the statistics, for the current publication of which he is responsible, to form some estimate of his accomplishment. A study of these matters is a useful preliminary to any consideration of the supreme enforcement drive, which, according to Mr. Woodcock's own announcement, is now ready to begin with the aid of the 500 new operatives for which the last Congress made provision. Every indication points to the probability that this drive will be in fact as well as in name the greatest offensive ever conducted by enforcement agencies on the prohibition front. Around its success or failure much of the future debate over this issue is almost certain to revolve.

Although Mr. Woodcock has insisted from the beginning that he has nothing to do with the politics of prohibition, nearly everything that he does has potential repercussions of a political character. The political implications seem particularly important in the case of Mr. Woodcock's fundamental policy of forcing federal dry agents to be decent, or as he would phrase it, to keep within the law. This policy, which was the first big innovation for which the new director was responsible, seems much less likely to serve as a

barrier to the bootleg business than as a bulwark against the political darts so often leveled at prohibition in the past through the enforcement agencies. In adopting decency as one of his watchwords, Mr. Woodcock has in fact demonstrated once more that sound sense may often be sound politics—a truth of which too many of our would-be statesmen seem unaware.

Although the policy of decency has expressed itself in many ways, its most important manifestation has been in connection with the operations of federal dry agents on the public highways. Before Mr. Woodcock's appointment, prohibition operatives were notoriously unmindful of the rights of motorists and flagrantly unrestrained in their use of firearms against innocent travelers. Numerous killings of persons wholly unconnected with the liquor traffic were reported and still more numerous interferences with the movements of law-abiding citizens. Mr. Woodcock began his tenure by insisting that his men stop these pernicious and illegal forms of activity. Within less than a month after he took office, he suspended two dry agents for stopping and searching a car in his own State of Maryland on the report of an unknown stranger that it was carrying liquor.

The investigation upon which this disciplinary action was based was completed and the order of suspension issued within twenty-four hours after the complaint of the aggrieved motorist reached the director's desk. This prompt and decisive action, which Mr. Woodcock followed up by requiring all prohibition cars to carry identifying insignia when overhauling suspected automobiles on the road, put the whole dry force on notice that such irresponsible tactics would no longer be tolerated. In the Maryland case Mr. Woodcock laid down the rule that cars should be stopped and searched only when the searchers had probable cause—in the strict legal sense of the term—to believe that the law was being violated. This rule he has continued to emphasize with the result that complaints against dangerous official depredations on the highways have about ceased. The change has hardly improved the efficiency of the dry forces but it has deprived the opponents of prohibition of an important source of critical ammunition for use against the federal enforcement agencies. Since federal enforcement agencies had drawn much of the wet fire, this may easily prove a major political gain.

Of somewhat similar import is the Woodcock policy of concentrating on the commercial fellows, allowing private violators of the law to go their way. The primary purpose and effect of this policy are, of course, administrative, but the ban on federal invasions of private homes and on interference with flask carriers, both of which have on occasion caused public vexation in the past, has some tendency to disarm criticism. The same may be said of the effort to improve the moral and intellectual tone of the dry enforcement army. The results of this particular effort are not very clear as yet, but there are grounds for believing that increased care in the selection and training of men and increased emphasis on dignity and intelligence in actual op-

erations have caused a decline in the corruption and profligacy which were so often in evidence and which under former regimes provided the wets with some of their choicest arguments.

It must be noted, however, that certain of the old practices remain, and that their continued use raises a doubt whether the moral tone of the bureau Mr. Woodcock heads can ever be raised to the level to which he aspires. The use of informers, the practice of wire-tapping, which a dissenting minority of the United States Supreme Court characterized as "dirty business," the operation of under-cover offices around which unpleasant charges of government liquor selling often center—these forms of activity Mr. Woodcock condones. He says that he is personally opposed to the use of informers, but has yielded to the exigencies of practical law enforcement as expounded by men in his bureau, who say that such practices form a necessary part of enforcement. These practices are more in keeping with the police atmosphere from which the dry leader says he wants to get away than with the rarefied air of intellectual investigation to which he hopes to attain. Incidentally, they continue to provide the critics of federal prohibition with arguments which the policy of decency has done so much in other directions to cut off.

Important as the political implications of the policy of decency may be, the ultimate success of the Woodcock regime will depend not upon improvement in the relations between the Prohibition Bureau and the public, but upon the suppression of the liquor traffic. This is an administrative matter, and on the administrative side Mr. Woodcock's big contribution to prohibition policy is his campaign of "steady pressure." He professes to believe that "steady pressure" applied by a force of intelligent and gentlemanly investigators against commercial violators of the law will stop the traffic in intoxicants. In his testimony before a House committee last winter he even went so far as to predict that it would close all the speakeasies.

Any consideration of this belief and of the campaign to which it relates brings us squarely against the fundamental prohibition-enforcement problem. This problem is whether the American traffic in alcohol can be dried up by the use of legal sanctions. It involves first of all the question whether it is possible to catch and prosecute all the violators of a law which a large proportion of the public disregards. There is also involved the question whether if all the violators were at some time or another caught and punished in accordance with Mr. Woodcock's ideal, the manufacture and sale of intoxicants would cease. The importance of the Woodcock regime is that it bids fair for the first time since federal prohibition began to provide a documented answer to both these questions.

For the new policies, even in their first year, have resulted in the application of powerful legal sanctions to an increasing number of prohibition offenders. The much-advertised campaign of "steady pressure" when translated into action means nothing more nor less than jail for more and more people. The record of Mr. Woodcock's first year shows 29,465 Volstead offenders sent to jail from the federal courts. It is the greatest flood of prison sentences that ever flowed from the supposedly pure fountains of federal justice. It represents an increase of 31 per cent over the 22,405 individual jail sentences of the previous fiscal year,

and it is almost twice the number of such sentences in 1928 when Mr. Hoover was pledging himself to enforcement.

Moreover, the flood is still rising. In the first six months of Mr. Woodcock's tenure, federal courts were turning out prison sentences at the rate of about 25,000 a year. But when the fiscal year closed, they were being ground out at the rate of from 35,000 to 40,000 a year. The increase may be due to the addition of 150 dry agents to the Prohibition Bureau's forces after Congress adjourned, or it may be due to the increased efficiency of the old agencies, or to both these causes. In any event there is in this record a reasonably strong indication that with 350 more agents going into action this year, and with Mr. Woodcock still drumming away at his "steady pressure" doctrine, the curve of incarcerations will continue to rise. It would seem that here at last is the man to demonstrate what results the strong-arm theory of enforcement which underlay the Jones five-and-ten law will actually produce in practice.

The great increase in prison sentences is the more significant because of the fact that the aggregate of fines imposed during the prohibition year of 1931 was only \$5,497,566, the smallest figure of any year since 1922. There was also a drop in the number of permanent injunctions in padlock cases from 8,801 in 1930 to 6,449 in Mr. Woodcock's first year. A suggested explanation of the decline in padlocks is the practice under which an increasing number of property-owners voluntarily get rid of prohibition "nuisances" to which the authorities may call attention. But even after taking this explanation into account, the diverging trend between imprisonments on the one hand and other prohibition penalties on the other tends to confirm the impression that the new director is taking the philosophy of the Jones law very much to heart in preparing his cases for trial.

There are many drawbacks that may militate against the success of the Woodcock drive. Many of the most important issues in the prohibition controversy are involved, and opinions will vary in accordance with the shade of moisture or dryness of the individual. But two drawbacks are inherent in the scheme itself, the one real and the other potential. The first arises from the fact that the application of "steady pressure" is by no means uniform. The average jail sentence in 1931 was 226 days, but there were a number of districts in which the duration of the sentence was often less than one-fourth of this figure. In June, for example, the average jail sentence in Connecticut was only 50 days, in the Southern District of New York it was only 10 days, and in Rhode Island the same figure. There must be a wide divergence between the effectiveness of "steady pressure" in such districts and its effectiveness in the Eastern District of Kentucky, where the average sentence in June was 597 days. It is a question whether Mr. Woodcock can ever get sentences up to the sticking-point in such wet States as New York and Connecticut. Yet those States are the ones in which federal effort is most needed to give effectiveness to the prohibitory statutes.

A potential drawback to the Woodcock campaign is the possibility that the increased zeal of federal prosecutors may cause a slackening of activity on the part of the States which are now working to back up the dry regime. This at present is a possibility and nothing more, but in view of the quite evident disposition on the part of the States to let Uncle Sam carry all the financial burdens they can shift to

his shoulders, it is worth taking into account. Mr. Woodcock has made it one of his cardinal purposes to promote State cooperation wherever possible. He says he is thoroughly satisfied with the result, but since he has commented favorably on the help he has received from Maryland and New York, which are notoriously unmindful of prohibition, one is forced to the conclusion that his expressions of satisfaction are but part of his avowed policy of avoiding all criticism of the way in which the States exercise their concurrent prohibition powers. In the dry areas, however, State support is undoubtedly forthcoming. Its diminution might cause a setback to the new federal policy.

Such disadvantages may interfere with the success of the Woodcock regime, but they will not affect its validity as a test of federal prohibition enforcement. If Mr. Woodcock keeps on in the paths he has charted he will do as much as any man can do without the aid of the army, the navy, and the marine corps to give federal prohibition the full and fair test for which its advocates have been clamoring. As to the outcome of the test and as to the desirability of its purposes, that is another story.

In the Driftway

THERE is a certain consolation in reading weather reports, and the instinct of the newspapers that the weather is front-page news is certainly sound. To read that the day before, sweltering still in memory, was the record high temperature for all time is somehow very cheering, even on another hot morning. And when the temperature remains unsympathetically low, the humidity always obliges with an upward burst to account for one's discomfort. Aside from this unfailing daily occupation, however, the Drifter has other ways of combating the burden of the heat. In the first place he keeps all his windows closed; then he drinks water without ice, and lots of it; he throws all constricting clothing out of the window or into a convenient closet; he disconnects the telephone, he cuts the door-bell wire (this innocent amount of sabotage is readily explained and compensated for later to the landlord), and he settles himself down to a book.

THERE are many kinds of solacing hot-weather reading, few more successful than John Muir's "My First Summer in the Sierra." There is in this book a constant sound of rushing water, cool, bright, refreshing; there is wind blowing through fragrant pines; there are acres of fresh flowers. But this is not the only good book for sultry days. The Drifter recalls one summer spent principally in New York, although green pastures urged him elsewhere. He was obliged, therefore, not only to forget the heat but the necessity that kept him in it. He read "The Idiot" and "Crime and Punishment" and "The Brothers Karamazov," and in their restless energy he lost sight of all minor discomforts. He read Ring Lardner's "Round Up" and found energy in it also, not to be despised beside that of Dostoevski. On the whole he found that only the great books kept his attention from the thick murkiness of his surroundings. He has never understood what is com-

monly meant by "summer reading." It takes, not a light and frivolous book, but a serious, solid, meaty one to keep his mind off his own troubles.

* * * * *

THERE is, too, the important question of what to eat in hot weather. Certain misguided persons advise cold food, mostly grass and hay. To this the Drifter is unalterably opposed. After a torrid day, when one's energy is spent largely in complaining and sweating, there is nothing quite so intoxicating as a nice, juicy beefsteak, not too well done. If this is partaken of with fruit on the side, and certain garnishes of potato and coffee, and if one sits absolutely still after eating it and does not pace the floor or dash to the movies or ride through steaming streets in an automobile, the heat will be no more than a pleasant adjunct to the serious business of digestion. All this, of course, is advice for the unfortunate person compelled to spend hot days in a city like New York. There are persons, or so the Drifter has heard, who disport themselves by mountain lakes, where the water is cold enough to take away the breath; there are others who bathe in the ocean, far from crowds and hot-dog stands and roller coasters; there are green fields and swift winds and an almost complete absence of the human race. But for those who do not know these delights, a calm mind, a large book, and a good beefsteak afford a surprisingly adequate substitute.

THE DRIFTER

Correspondence

Socialist Relief

TO THE EDITOR OF THE NATION:

SIR: In your issue of July 29, in an article by Mr. Hallgren, it is stated in describing strike-relief work of the Socialist Party: "They [the Socialist Party] are at great pains to see that only present and former members of the party (many of the latter of whom have gone over to the Communists) benefit by the relief they dispense." May we take this opportunity to deny emphatically such a state of affairs and to deny that anything was said to Mr. Hallgren during his interviews with the administrative committee of the Miners' Relief Fund of the Socialist Party to justify his statement?

I have before me at the date of writing a file of signed receipts showing every delivery of relief materials that has been made by our fund to date. This file discloses that of some thirty deliveries made by our committee beginning June 30, there were only two cases in which relief was delivered into the charge of Socialist Party members. Of these two cases, the first was discontinued after the original delivery, the Socialist group in question at Strabane, Pennsylvania, taking the initiative in the organization of a National Miners' Union relief kitchen. The other case is a minor one involving a group of about a dozen families whose heads are on strike under the National Miners' Union and about half of whom happen to be Socialist Party members. Of the thirty main shipments distributed, twenty-two went to National Miners' Union commissaries, four shipments went to groups of striking miners who still cherish the United Mine Workers' label, and the remainder went to miscellaneous groups, including the Socialist ones I have referred to. Mr. Hallgren was with Colston Warne and William L. Nunn of New York when these gentlemen visited our office and were shown these same records. May we

note that this committee of Nunn, Hallgren, and Warne called our attention to the virtual starvation at Penowa, Pennsylvania, where no other group was delivering relief? The following day a truckload of food was sent into this remote settlement without delay or question. These miners have never heard the word Socialist as far as we know. It is important to note also that not a single piece of propaganda literature has gone out with these shipments, not because we don't believe in propaganda but because we who are on the ground realize, as Mr. Hallgren on a four-day visit cannot, that the great number of miners are neither Socialists nor Communists, nor are they preoccupied with political issues, their full attention being engaged in the necessities of an industrial struggle. We have repeatedly and accurately declared that our committee is sending whatever it receives directly into the strike area with total disregard either for the union or for the political affiliation of miners as long as they are strikers.

Pittsburgh, July 27

SARAH LIMBACH,

Secretary Miners' Relief Fund of the Socialist Party

[With regard to this letter from Miss Limbach, Mr. Hallgren states: "The writer appears to be laboring under the misapprehension that a miner who has joined the National Miners' Union cannot once have been a Socialist. In my inquiries in many coal towns I found any number of Socialists and former Socialists, the latter being for the most part members of the N.M.U., who had benefited by relief distributed through the Miners' Relief Fund of the Socialist Party. The writer, it may be noted, admits that most of the Socialist relief has gone to N.M.U. commissaries. I wish to point out that in the districts where these particular commissaries are functioning I found the former Socialists to be especially numerous. An unprejudiced investigation, I am sure, would show this to be true. I do not understand the writer's reference to my interviews with the administrative committee of the Miners' Relief Fund. Certainly nowhere in my article did I suggest that my observations were based on any statement of policy uttered by the committee in my presence."—EDITOR THE NATION.]

Desperate Need

TO THE EDITOR OF THE NATION:

SIR: "Maybe you don't know who I am but my husband was killed here in Arnold City in the mine riot on June 23 and I am left with five children. So I would like you to send someone out here to advise what to do and how to go about doing it."

Mrs. Mary Philipovich, who writes this letter to the Prisoners' Relief Fund, is twenty-six years old and expects a baby in a few weeks. Her husband, Mike Philipovich, was a sympathetic storekeeper in Arnold City who had been helping the striking miners with relief. For his sympathy he was shot and killed by deputies in front of his own store.

The five children are all under ten years old, have neither shoes nor stockings, and according to Bob Cruden, who went to see them, are "obviously undernourished."

At least for the next few weeks, until her baby comes and until she herself is well and strong once more, Mary Philipovich must have help. Every dollar sent for her relief will reach her promptly through a representative of the Prisoners' Relief Fund, of which Robert Dunn is chairman. Mark your contribution "for Mary Philipovich" and send it to Prisoners' Relief Fund, 80 East Eleventh Street, New York City, or to Grace Hutchins, treasurer, at the same address.

Night Is Here

By ROBERT P. TRISTRAM COFFIN

The day of crystal now is done,
Small children sated with the sun
Lie brown on pillows cool and white,
Vast thunderheads stand up from night
And hold the sunset on their towers,
The fields are full of sudden flowers,
Of fireflies, and whippoorwills
Call behind the darkened hills.

Night is here, and sleep holds up
The starry bubbles of her cup
To the lips of men and birds
To hush and drown their songs and words,
Make them forget their pulse and breath
Like the lords of life and death,
Make them friends of nebulae
And brothers of the thoughtless sea.

A Study in Comeliness

Shadows on the Rock. By Willa Cather. Alfred A. Knopf.
\$2.50.

NO American writer writes more beautifully than Miss Cather, with more care for the just word, for the pure phrase, for the noble and elevated idea. It is no longer necessary to say that she is in the very front rank of American novelists. There would be plenty of persons to put her securely in first place; but comparisons of this sort are unnecessary to establish her quality. Wherever her place, it is hers and hers alone. She can claim undisputed title to it by virtue of her unceasing labor in the cause of fine writing. She has given herself to it with the ardor of one of her own *religieuses*, and the results have been altogether worthy of her devotion.

Her latest novel is a triumphant series of examples of her talents. Laid in the Quebec of the late seventeenth century, it paints the life of that passionately French colony with broad, smooth strokes. If it centers around the apothecary, Euclide Auclair, and his daughter Cécile, it draws within its strong light many others of the colonists: Jacques, the son of the village prostitute; Count Frontenac, Auclair's patron, proud, reserved, defeated; the old Bishop, spending his body and his soul for Christ; the young Bishop, proud also, and unsure of his powers, reckless, extravagant, broken by life before he leaves it; Pierre Charron, the colonial adventurer of the best type, full of life and strength and gaiety; and the recluse, Jeanne Le Ber, giving the last second of her time, the last ounce of her strength, the very drops of her blood, in undeviating and passionate zeal for God.

With this group and several others only a little less clear, Miss Cather recreates the Quebec of 1700 and the France of the same time. In the apothecary's household are assembled all the virtues that the French can claim. It is a comely household; twelve-year-old Cécile, with her cleanliness, her piety, her skill at cooking and housewifery, her sweet and childish ardors, makes it so; and the apothecary, wise, calm, loyal, makes it so also. In the little shop and the sitting-room behind it dwell order, peace, and love. It is Miss Cather's particular gift that when she writes of these virtues she makes all other

characteristics seem unnecessary. If this is not in fact a comely world, her world is altogether comely and convincing. Cécile, back from a visit to sluttish, disorderly people, reflects on her own cleanly home. "These coppers, big and little, these brooms and clouts and brushes, were tools; and with them one made, not shoes or cabinet work, but life itself. One made a climate within a climate; one made the days, the complexion, the special flavor, the special happiness of each day as it passed; one made life." Miss Cather has made life of the complexion she likes it to be, she has made her own special flavor and happiness and climate. It is not romance, it is surely not realism. It is something more; a kind of undubitable piety and goodness which warm the heart and refresh the mind and occasionally bring tears to the eyes.

Having said all this, I can say that I think a certain quality of coherence and growth has gone out of Miss Cather's writings. She becomes increasingly disparate and episodic. In her best books, which I should say were "The Song of the Lark," "My Antonia," and "A Lost Lady," she builds up her episodes into a tightly knit and meaningful whole, not wholly because they are built around a central character—"Death Comes for the Archbishop" and "Shadows on the Rock" move around central characters—but because Thea and Antonia and Mrs. Forrester actually live their lives before our eyes, because we see them not only accepting life but wrestling with it, trying to mold it to their own desire. They are strong and they do not always succeed; they try to shape their destinies and in the end are shaped by them. This struggle with life is fainter in "Death Comes for the Archbishop"; in "Shadows on the Rock" it has almost disappeared. One feels that the characters in the latter book completed their earthly existence before the tale began and are engaged in shadowy and painless struggles with their past, struggles in which no blood is spilt because the blood has gone out of them into the color of the Quebec sky, into the red of Cécile's curtains drawn tightly over the windows to keep out the wind and the sound of the rain.

My only objection to this sort of soberly splendid landscape painting is that Miss Cather is still in the height of her middle years and it is not time for her to become reminiscent or resigned. Archbishop Latour, at seventy-five, could write: "I am enjoying to the full that period of reflection which is the happiest conclusion to a life of action." If one may say so without being impertinent, Miss Cather is two decades away from such a period. I should like to see from her hand another novel with more edge to it; one that was no less shapely or beautiful or wise, but one in which her characters were presented in process of learning all that she knows about life. But if she will not do it, we may be well content with what we have.

DOROTHY VAN DOREN

Charming Sir Edmund

The Life and Letters of Sir Edmund Gosse. By Evan Charteris. Harper and Brothers. \$5.

BEGIN at the beginning with Edmund Gosse. He was a boy in search of a father. Philip Henry Gosse, the father in the flesh, somehow eluded him and left the lonely, delicate boy out in the fearful dark. Philip Gosse, a widower with an only son, loved the son a bit too well; he must make him over into his own image or reject him. The boy could make no adequate response to the deeply religious, turgid emotions of the full-grown man. The father whom he yearned for would eat him alive; this meant a long, wavering war between father and son that was not to be settled until after

the father's death, and Edmund Gosse's own book, "Father and Son," was written, and Edmund himself a man past middle age.

This warfare was the background of Edmund Gosse's career, from which he learned a complete manual of diplomatic arts. Escape from destruction was to be found not by running away, nor by fighting back directly (for the enemy was too powerful), but by nourishing a talent for persuasive charm. When the time came for young Edmund Gosse to go to London as a clerk in the British Museum, he had already mastered his gifts for tact and a variety of small maneuvers of advance and retreat. Personal charm was an art to be learned above all other arts and to guide the wandering of a sensitive and fearful eye. Young Gosse had also caught something of the fever for adventure that characterized the Victorian mind. He set himself the task of learning foreign languages, particularly the Scandinavian. This was to be fostered as an exotic voyage away from puritanism and the Sunday meeting-house. It was to be used for practical as well as social advantages, an accomplishment that would enable him to make friends in a drawing-room and to advance his position as a clerk. He made himself alert and ripe for opportunity. His search for a father was readily converted into whole-hearted hero-worship, and there were many heroes to be found in London during the 1870's. First of all, there was the Pre-Raphaelite Brotherhood with Swinburne and Rossetti flaming at its center. An introduction to the circle was like tasting forbidden fruit. But before Gosse could eat his fill, he spent a short vacation abroad which led him into Scandinavia and Copenhagen. Almost at once he became the advance guard of Scandinavian literature in London, publicity man extraordinary representing Brandes, Ibsen and Company to the English-speaking world. It was impossible not to be captivated by the deferential young Englishman who gazed upon literary Copenhagen with something of the same awe with which the ancient Norsemen gazed upon the gods.

Edmund Gosse's early instincts had served him well. He had secured a position as translator on the Board of Trade and was accepted both in London and in Copenhagen as the official spokesman for all of literary Scandinavia. His secure position gave him authority to defend his heroes of the Pre-Raphaelite Brotherhood. They accepted him on equal terms and fought for his poetry with the same enthusiasm with which they carried their own work to recognition and victory. But Edmund Gosse's passion for hero-worship remained ungratified. The Pre-Raphaelite group was, after all, a small charmed circle, and Edmund Gosse had discovered that his talent for making friends was no mean gift. Here, on one hand, was romantic young Robert Louis Stevenson and, on the other, Thomas Hardy. Even from the first he had reconciled friendship with Austin Dobson and Algernon Swinburne. He had good reason to suspect that his tastes were as catholic as the wide world itself and that his social poise functioned as an admirable substitute for critical discernment. His appreciation of William Dean Howells and Henry James led to a lecture tour in America. Gosse found himself far more popular than the less trustful Matthew Arnold. On his return from America he was offered the position of Clark Lecturer at Cambridge, for which he supplied the subject of the American lectures, "From Shakespeare to Pope." His record of continuous success was still unbroken; it was not until the lectures appeared in book form and were reviewed by John Churton Collins in October, 1886, that the storm fell upon his shoulders. Poor Gosse was bewildered. Collins was an old friend; he had been a guest at Gosse's literary teas, served as only Gosse knew how to serve them, urbane, graceful, civilized, with Mrs. Gosse a perfect hostess. Collins elaborated upon Gosse's errors, pointed out misstatements of fact, and reprimanded Gosse as he would an indolent and careless schoolboy. Gosse, to put it mildly, was

badly shaken. Friends rushed to his defense; Tennyson roared against Collins at a garden party; Cambridge renewed the invitation for the Clark Lectureship. Despite this loyal support, Gosse's self-confidence was undermined. He became even more delightful, more cautious. Charm had always been his real weapon of defense. He could interpret literature prettily and at length; he could mold himself gracefully to the will of another writer. He had made his important discoveries: Ibsen, Brandes, Saint-Beuve, Swinburne, Thomas Hardy, and Robert Louis Stevenson. He could point out minor flaws and appreciate their merits. All this is on the credit side of his ledger. His gifts were creative rather than critical; sharp analysis baffled him. The attack led by Collins left him naked. One might say that he feared to go beyond the horizons already circumscribed. Meanwhile his popularity increased. In the nineties he was regarded as the benevolent godfather of the *Yellow Book*. At the turn of the century George Moore suggested that Gosse should write down the story of his relationship to his father. Gosse took advantage of Moore's advice. In 1907 the book appeared and its success was instantaneous. At last Gosse had found his medium; attack or praise no longer mattered in the least. Gosse himself was neatly settled in his berth as Librarian of the House of Lords.

The rest of the story told by Evan Charteris in his sympathetic "official" biography is one of gentle decline. Gosse's urbanity flowed serenely onward. Gosse greeted the Georgian poets, worried over the reckless realism (!) of Siegfried Sassoon, and hailed J. C. Squire as a dazzling poetic genius. Perhaps the only discovery of his later years that merits serious attention was his enthusiasm for André Gide. At the close of his life one is reminded of his conversation with Oscar Wilde, duly recorded by Mr. Charteris. Wilde said that he was very glad indeed to meet Gosse. Gosse said: "I was afraid you would be disappointed." Wilde replied: "I am never disappointed in literary men; I think they are perfectly charming. It is their works I find so disappointing."

HORACE GREGORY

"Addressee Not Found"

Epistle to Prometheus. By Babette Deutsch. Jonathan Cape and Harrison Smith. \$2.

ONE might prefer to have the modern poet forge his own symbols, but if he must look for a fragment of divinity among the ruins of the Greek pantheon, he can make no happier choice than Prometheus. Shelley wrote: "The only imaginary being resembling in any degree Prometheus is Satan; and Prometheus is, in my judgment, a more poetical character than Satan, because, in addition to courage, and majesty, and firm and patient opposition to omnipotent force, he is susceptible of being described as exempt from the taints of ambition, envy, revenge, and a desire for personal aggrandizement."

Babette Deutsch has not attempted to translate the passionate magnificence of the stealer of fire. She begins by describing him as "the gentle Titan, whom somewhat I confuse with Jahveh," but she is the child of a skeptical generation and has no real faith in him, even as a symbol. He remains a philosophic abstraction; her letter is posted to "a myth, a figment, a ghost that never wore flesh."

"Epistle to Prometheus" is divided into ten sections, each bearing an apposite quotation. Various inheritors of the Promethean fire appear chronologically either in person or by implication. Among them are Homer, Jesus, Boethius, Shakespeare, Voltaire, Lenin, and Gandhi. Miss Deutsch's vers libre, a quick rhetorical instrument, is varied by metrical patterns designed to coincide with the several persons and historical eras of her

poem. Thus Homer is introduced by hexameters, Shakespeare by a sonnet, Voltaire (alas!) by a ballade.

I should like to praise "Epistle to Prometheus" without reservation, for it has a number of rare and excellent virtues. Its sobriety, discipline, ambition, and scholarship seem to me admirable. At the same time I must confess that the poem leaves me imaginatively and emotionally cold. It is a letter that does not reach its destination.

Perhaps it overreaches. The impulse behind the work, as in most long poems of our time, is essentially brief and lyrical. The heart of these verses is in Miss Deutsch's personal declaration:

But now I seek you,
now, having left behind
the early radiance,
not having found
the central sustaining fire;
in this obscure
and middle ground I stand, I ask
respite from time that shreds the song of being
and every knot of being to no sound.

The whole historical apparatus of the poem, the long tracing of the Promethean dynasty down to contemporary protagonists, is seen to be merely the prelude to a subjective quest, a self-exploration for creative fire, a fashionable philosophy of defeatism.

Miss Deutsch, straining for a meaning, continues:

here on this earth, infirm
among the tensions
of panting nebulae that bring forth stars
whose grandfather was Chaos;
here in this wide
and barbarous world I stand . . .

The defect that mars this passage is present even in the structure of the poem. It is what Coleridge identified as "mental bombast," thoughts and images too great for the subject. A theologian might, not unkindly, describe "Epistle to Prometheus" as a work of supererogation.

STANLEY J. KUNITZ

El Greco and "Interpretation"

The Birth of Western Painting. By Arthur Byron and David Talbot Rice. Alfred A. Knopf. \$10.

THE history of art and culture is apparently written in cycles. From century to century it is outlined by scholars courageous enough to sift the researches of the past and to carry out those vast projects of comprehensive chronicle and synthesis which lay out the program for future investigation. Around the beginning of the present century a large group of international students were recasting the cultural history of Europe along broad lines: Boissonnade, Mommsen, Burckhardt, Venturi, Berenson, Pijoan, van Marle. In their wake followed the specialists, conspicuous among whose tasks was the complex one of relating Western art to its Eastern origins and content. Largely through the work of these men (the list of names is again a long one: Errard, Ormonde Dalton, Corrado Ricci, Diehl, Bayet, Michel, and others) the study of the provenience of modern aesthetic ideas and styles has been liberated from the traditional lines of Renaissance archaeology laid down by Vasari and his followers, and a new formulation of the principles of Western art has been made possible. Of these three successive types of historical investigation—the comprehensive, the specialized, and the speculative—"The Birth of Western Painting" belongs to the third.

Broadly stated, the book's purpose is to trace the "interpretational ideal" in Western painting, chiefly Italian and

Spanish, through the work of Duccio and Giotto to its origins in the style and iconography of Byzantine decoration, especially that in the monuments of Mistra and Mount Athos. Thereby the authors present an ulterior thesis: that art ultimately rejects "arbitrary iconography," "the conventions of revived antiquity," and "the prison of naturalism," in order to find in interpretation its own "freedom, absolute and opposed by no ingrained culture." More specifically, the volume claims that this freedom found in El Greco (through his Cretan origin the direct inheritor of Byzantine methods) its last defender before the appearance of the impressionists and Cézanne in the nineteenth century. Continuing the exaltation of El Greco which was begun, at the expense of Velasquez, by Maier-Graefe in "The Spanish Journey" a quarter-century ago, the authors locate him in his racial background as the last representative of those Byzantine interpreters who

. . . in the eighth and ninth centuries . . . discovered a new purpose in art. In the tenth and eleventh they perfected a corresponding technique. In the eleventh and twelfth . . . [they] coalesced in a common impulse toward humanization. In the thirteenth and fourteenth they communicated the purpose, in the guise of a humanized style of painting, to Italy. The Italians then revived the classical technique of reproduction, which so overwhelmed them that, in the sixteenth, they lost the purpose. But in the sixteenth came the last Byzantine, who borrowed of the new freedom, only to further the original aim. Then he died without succession; and not until three centuries later was the aim rediscovered. This is the history of interpretational painting in Europe.

The present volume falls squarely into two parts: Mr. Byron's essay, the boldness and frequent deficiency of whose outline should not blind the reader to its vigor and importance; and Mr. Rice's photographs, one of the best studies in stylistic evolution in recent scholarship. Byron's thesis is its own confession of risk. In some two hundred pages he steps from medieval Greece to Cézanne. The gaps in his presentation are hardly excused by his plea for a corrective ideation. He fails to account for the presence of unquestionable interpretational elements in primitive Italian and Gothic art before the assertion of the Byzantine influence. His summary of political and social motives is clouded by his uncertainty as to the exact nature of an artist's indebtedness to the external conditions of culture and society under which he works. El Greco's roots are too facilely separated from his growth in Italy and Spain, and in order to promote the value of interpretational motives in painting, Mr. Byron indulges in a kind of heckling petulance and generalization which leads him, now to cast loose aspersions on such representatives of Renaissance ideas as Michelangelo, Velasquez, and Rubens, and now to subordinate the entire spiritual evolution of Western art to the ideal of "aesthetic objectivity" achieved in Byzantium.

Nevertheless, he has outlined in its underlying logic one of the major transitions in the history of art. In so doing, he has suggested at least three problems for emphasis by future historians: the formal contribution of Byzantine art to Renaissance styles in Italy; the relation of painters like Duccio and Giotto to their Eastern as well as Gothic ancestors; and, lastly, the thorny matter of El Greco's character and its basic contribution to modern design and color. El Greco today claims more hostile partisans than any other historical painter. With Pijoan claiming him as the spiritual child of Spain, with Waterhouse stressing his Italian derivations, and with August Mayer and the present authors insisting on his Byzantine foundation, his pivotal position must at last be acknowledged. "The Birth of Western Painting" will leave its mark on art studies if it merely promotes those investigations into Western painting to which El Greco provides a salient clue.

MORTON DAUWEN ZABEL

The General Strike

The General Strike. By Wilfrid H. Crook. University of North Carolina Press. \$6.

FROM their inception the labor organizations of the world have naturally discussed the policies and tactics of offense and defense. After it was recognized that the strength of the workers lies in collective action, it became inevitable that the discussion should center around what forms of collective action were likely to prove most effective. In that connection the question immediately arose as to what kind of action would be most desirable in extraordinarily critical periods when the interests of the entire working class of a country—or the world—were at stake. The resort to non-payment of taxes and barricade fighting, which the bourgeoisie had used effectively against the monarchical elements, was found inadequate. The workers pay little by way of direct taxes, and modern governments are too well organized with their police and militia to make barricade fighting effective. Moreover, the organized workers may at times want to act as a unit against the employers or capitalists. Hence, the idea of the general strike came into vogue. But that immediately raises the question, For what purpose is the general strike to be used? Wilfrid H. Crook, in his comprehensive and scholarly study of the general strike, points out that there are three kinds—political, economic, and revolutionary. That is, the workers may call a general strike because of political grievances against the government, or because of economic grievances against employers; but in both these cases the aim is "reformistic." Then there is the general strike which sets as its goal the overthrow of the present system. All three have been used from time to time, but the political "reformistic" strike has thus far netted the most tangible results.

Naturally the idea of the general strike was not accepted without much heated debate. Certain Marxian elements opposed it because they feared it might supplant political action. However, after the turn of the century, all the radical groups accepted the idea. The Socialists were inclined to feature the political, and the Syndicalists the economic strike, although the former recognized that under certain circumstances the economic strike is also feasible, if used with caution and only for "reformistic" purposes. Although the Syndicalists featured the economic strike, it was in countries of Socialist influence, as in Sweden, Holland, and England, that it was used most extensively.

Previous to the war the question of a general strike as a war preventive was debated, with the moderate radicals and the German Socialists particularly doubting its practicability. No clear-cut decision was arrived at and no attempt was made to use this weapon either at the outbreak of hostilities or during the war.

What about the effectiveness of the general strike? Thus far, for various reasons, it has not proved very effective. The proper technique has not yet been devised for calling and conducting such a strike. Besides, the success of a general strike, particularly for revolutionary purposes in a modern capitalistic nation, would depend not only upon the support it received from the workers, but also upon the extent to which it could win over the middle classes, and the degree to which it could infuse national armed forces with a spirit of class consciousness. Naturally the capitalistic forces have not stood idly by during a general strike. Even in the case of "reformistic" general strikes the governments and the capitalistic interests have taken advantage of all the patriotic sentiments to organize the middle classes against the strike, and in cooperation with the military forces they have used them to man the essential services.

As the author indicates, under present conditions more general strikes are inevitable, and their success will depend on the ability for planning and leading the strikes, as well as the degree to which the movement can win over large groups of middle-class and military elements. While much has been written on the general strike, this is the first thorough and scholarly study of the subject. It is well documented and contains an excellent bibliography. The book may be considered the authoritative work on the subject.

DAVID J. SAPOSS

New York's Palmy Days

Annals of the New York Stage. By George C. D. Odell. Volume V (1843-50); Volume VI (1850-57); Volume VII (1857-65). Columbia University Press. \$26.25.

DR. ODELL has reached the end of his seventh volume of "Annals of the New York Stage." An arithmetical count indicates that in about 4,900 closely packed and generous-sized pages he has taken his narrative from speculative beginnings, and has brought his day-by-day account through the troublous war year of 1865. One does not look for style in such a reference book. The torrents of dates and play titles and casts—so generously indexed in each book—scarcely invite variety of treatment. But it is surprising how light and exuberant is the spirit of Dr. Odell, as he puts himself in the place of each generation and reviews every imaginable form of entertainment, from classic repertory to circus, giving due proportion and credit to distinctive players and famous productions. Though ostensibly a reference book, unique in its scholarly concern for seemingly unimportant dates, there are pages in these volumes that show a refreshing enthusiasm. Right through the many years of arduous labor Dr. Odell has never faltered. And the seven monuments now on the shelf are fine examples, not only of calm determination, but of artistic printing of the highest order.

We are concerned here, in this small review, with the years 1843-65, detailed in three volumes. We see emerge into eminence a roster of actors traditionally constituting "the palmy days of the New York theater." The old-timers declare that never shall we see such days again. This statement we may wink at. But there is no doubt that actor families were then in the vigor of their very best qualities. The romantic Wallacks, the genial Jeffersons, the tragically morose Booths were in the ascendant, while Edwin Forrest roared at Macready until there was a riot at Astor Place, the handiwork largely of foolish petulance. For once, also, in our theater history, rowdy politics took the occasion of Macready's snobbishness to fulminate on soap-boxes against the condescension of certain foreigners.

Dr. Odell's panorama shows us actors rising into prominence and reaching years of retirement. Popular favor is never loyal for too many seasons. New York has always been greedy for change in entertainment. In the present three volumes there are no longer mentioned the names of George Frederick Cooke and Thomas Abthorpe Cooper, once the idols of favor. In these new pages, too, giant figures are about to depart ("are we so soon forgot when we are gone!")—J. B. Booth the elder, eccentric, electric, is perfectly willing that his son Edwin usurp the throne; Manager Simpson, a theatrical sport of the glorious Park Theater days (where on a visit Fanny Kemble's youthful beauty bloomed to perfection), retires after thirty-eight years' devotion to the stage, and the old Park's brilliancy flickers as other theaters farther up Broadway blaze new glories. Even Fanny Kemble, grown matronly now, gives readings and her Juliet is a memory. There come upon the

scene such figures as Lester Wallack, Laura Keane, Dion Boucicault, and Matilda Heron. Before we reach the last page of the seventh volume, we glimpse Tony Pastor singing on low variety stages, and Augustin Daly writing as dramatic critic on a local paper. The old order gives place to new. Dr. Odell sees the goal toward which he is working—how many volumes ahead we do not know.

I have always felt, as I followed his narrative, that its most valuable aspects were in the lowly arts which have always regaled New Yorkers. Those are fully noted. Dr. Odell is eminently just in his apportionment of record. Music lovers will find full inventory of concerts, the opera, and the Philharmonic. So meticulous is he that the arch of a brow, the curl of a lip, even the grace of leg shows and living pictures arrest his attention. The latest volumes before me present feeling descriptions of Jenny Lind and Patti, give due credit to Negro minstrelsy, and enlarge upon the mad frenzy which stirred audiences in the fifties over "Uncle Tom's Cabin." Though an advocate of the classical repertory, Dr. Odell interprets his task as being one of fair recording. He has scanned all the local papers—I ache for the sheer physical strain of it—and draws from the brown and crumbling columns strange happenings. And he chuckles amidst the dust whenever he finds our modern life forestalled. For example, in the forties the New York hotels advertised "Free and Easies," which must have put our tangos and fox trots to shame! Maybe, after all, much of the staidness of our elders and their elders was fictitious!

One is not supposed to read consecutively such a reference work as "Annals of the New York Stage." I have perhaps done more of it than is good for the mind. But to test such a narrative is the only way of understanding its thoroughness and all-inclusiveness. Use the index and you have an infinity of biographies; look under the entries for Bulwer-Lytton and Scott and Dickens, and you can measure what literary tastes were rampant among the reading public of the forties and fifties, and follow how well John Brougham, W. E. Burton, and Boucicault dramatized and mounted such works as "Night and Morning," "The Heart of Midlothian," and "David Copperfield." This was the era also of "The Count of Monte Cristo." Dr. Odell is generous in his quotations from critical opinions of the time. To some extent one has an anthology of newspaper dramatic criticism in these pages through many generations. In comparison with Joseph N. Ireland, who was New York's first theater historian, Dr. Odell is more scholarly, though maybe not quite so first hand; and of course Ireland ended about 1866. In contrast with T. Allston Brown, Dr. Odell is accurate to the hour instead of within a day or so. No one will wish to do over again what Dr. Odell has done, for there is no need. These seven volumes show New York always to have been a little theatrically crazy. So far, Dr. Odell's narrative gives ample evidence that in the "palmy days" audiences knew their classics well and were delighted in seeing many actors in the same role; that these audiences welcomed visitors from abroad, if for no other reason than to encourage the "home" player that he was not so bad after all. When E. L. Davenport went to London with "our little Mowatt," he roared against the careless ways of the English stage. When Charlotte Cushman was soundly berated for her crudeness by Macready, the home papers waved the flag and joined the Forrest ranks of super-Americans. Such tempo of moods and temper does not escape Dr. Odell.

With all his dates and casts piled toweringly on each side of him, I have wondered that this conscientious recorder has found time and space for so much comment as he makes. Of course such a reference work as this imposes its own limitations. By its very bulk and size it dims its high lights. But curiously, a mechanical index, by the number of references it gives to par-

ticular names and topics, draws the eye to the important happenings. In each volume keep your gaze upon the index and you will not go far wrong as to the popular acceptances during the years (to wit, two hundred and fifty in the seven volumes) of Manhattan's frenzied playgoing.

MONTROSE J. MOSES

Books in Brief

The Five-Year Plan of the Soviet Union. A Political Interpretation. By G. T. Grinko. International Publishers. \$3.50.

The author of this book held important offices in the Ukraine, where he won standing as a leader in economic and industrial planning, before being transferred to the vice-presidency of the State Planning Commission of the Soviet Republic. His book, as one would expect, is a stout and aggressive defense of the Five-Year Plan in all its aspects, with quite as much of economics as of politics in its "interpretation." What is said is, of course, a compound of record and prediction, the review covering such topics as the prospects of industrial development, Socialist rationalization and the workers, agricultural progress, the rise of a worker-peasant bloc, transportation by rail, water, and air, housing and city planning, the problem of skilled personnel and the cultural uplift of the masses, and the question of economic equilibrium during the critical five-year period. Such excess of accomplishment as there has been thus far Mr. Grinko attributes primarily to the cautious conservatism of the original plan, but he also emphasizes the enthusiastic response of the workers, the "superior utilization" of capital in continuous production with a consequent lowering of production costs, and the exposure and suppression of some counter-revolutionary sabotage. It is his conviction that there will be no return to capitalism, but that Russia is moving steadily toward the Socialist goal. The book is a powerful piece of argument and propaganda interspersed with sharp thrusts at capitalist pretensions.

The Life of the Empress Eugénie. By Robert Sencourt. Charles Scribner's Sons. \$5.

After a surfeit of biographies in the ironical and disparaging vein, refreshment may be found in the sympathetic study of Eugenia de Montijo. Mr. Sencourt is an avowed champion of the Empress, and documentarily exact withal. While his advocacy softens as far as possible the hard and selfish traits in her character, his honesty does not deny or conceal them. His narrative moves with spirit, and he stages the dramatic scenes effectively. If he does not quite succeed in making his heroine lovable, it is not because of his want of zeal, for he has thrown every favorable light on her motives and acts.

India and the Simon Report. By C. F. Andrews. The Macmillan Company. \$1.75.

The value of Mr. Andrews's analyses of things lies not in a treatment of technical aspects of India's problem but in a presentation of the psychological, the "spiritual." In this field no one surpasses him. His remarks on the Simon Commission's report are to the effect that it did not satisfy India because it failed to meet the question of restoring India's moral freedom almost lost through long subjection to foreign domination, and the question of reestablishing in India and throughout the Empire racial equality between white and black. Whether or not he is right in thinking these problems paramount in the Indian situation might be questioned by many Englishmen; but certainly only the ostrich-minded believe that India and Britain can be reconciled without solving them.

Francis Joseph I. The Downfall of an Empire. By Karl Tschuppik. Harcourt, Brace and Company. \$3.75.

Mr. Tschuppik's vividly written book is, of course, a history of Austria-Hungary from 1848 to 1916 as well as a biography of the emperor, since by no possibility can the two be separated. Its chief characteristic, aside from its frequent correction of what the author regards as the mistaken interpretations of Austrian history by other historians, is its careful exposition of the conflicting racial, political, and social elements with which the government of the emperor had to deal, the conflict between changing class interests and the growth of democratic ideas on the one hand and the reforms that were planned or instituted on the other, and the dogged adherence of Francis Joseph, who "never read a book" and to whom the whole notion of progress was alien, to the traditional Hapsburg policy of personal government. One gathers that the generation to which the author belongs, and whose views he represents, found it possible to love Austria while recognizing that its form must be changed, and that the long continuance of the monarchy was due to the existence of positive merits as well as to the force of use and wont. The appraisal of the ideas and work of Francis Joseph's chief ministers, and the examination of the political relations between Austria-Hungary and Germany and Russia, are particularly worthy of attention. As a contribution to a study of the remoter historical causes of the World War the book is of first-rate importance. The translation from the German by C. J. S. Sprigge has been excellently done.

Gabriel the Archangel. By Federico Nardelli and Arthur Livingston. Harcourt, Brace and Company. \$3.50.

A lambent lightning of mockery flickers continually in this biography of the self-constituted superman, Gabriele d'Annunzio. The authors maintain a posture of respect before the poet and the mold of mellifluous prose, but their account of his deeds and his Casanovian amorality is couched in words with double edges. They are like courtiers who bend low to hide their smiles. They describe his dazzling flight as artist and patriot, but the position they accord him in the angelic hierarchy is anything but celestial. Amusing and acidly flattering, this is the first full-length portrait of d'Annunzio in English.

The Unfinished Symphony. By David Ewen. Modern Classics Publishers. \$2.50.

In this "story-life" of Franz Schubert, an intense spotlight of sentimentality makes every shadow black with the misery of an unjust fate. One is not allowed to see that most of the composer's disappointments and sorrows had their roots in his own amiable impracticality. The author has not twisted facts to suit his fiction, and the idealized portrait will do very well for those readers, young or old, whose admiration for art is disturbed by criticism of the artist.

The World Crisis. By Winston Churchill. Charles Scribner's Sons. \$5.

Of all the records left by the wielders of war power, Churchill's, by its candor and objectivity, its spirited writing, and its perception of the true direction of events, stands far above the rest. Having been First Lord of the Admiralty, his emphasis is on the naval part of the war. Sea fights were few and inconclusive; but the task of destroying the raiders, maintaining the Mediterranean and North Sea blockade, protecting the transport and provisioning of the Allied armies in France, and finally of destroying the U-boats was remarkably well handled. His defense of the Dardanelles campaign and his explanation of the defeat are impressive in their logic. His analysis of operations in France is remarkable for its clearness.

Consider

... TEPOZTLAN

A place where the whole population plays one day in three the year round.

... where nobody is ever hungry and stomach ache is the ranking disease.

... where there is no unemployment, no dole, no breadlines.

... where a lawyer would starve to death because there is no legal work.

... where there is not a radio, a pair of silk stockings or a motion picture theatre.

... where a Freudian complex is unthinkable.

... where they never heard of a sales quota, but find a market or want for everything that is produced.

TEPOZTLAN isn't in Utopia—You will find it across the border in Mexico, part of the delectable potpourri of travel, history, economics, archaeology, religion, play and human nature which is

THE NATION

20 Vesey Street - - New York City

There is one explanation, however, that he fails to give us—of the Allied step that most needs defense, the occupation of Saloniki. The present edition concentrates in one volume, with minor revisions, the work previously issued in four.

A History of Later Latin Literature from the Middle of the Fourth to the End of the Seventeenth Century. By F. A. Wright and T. A. Sinclair. The Macmillan Company. \$4.75.

The authors of this work are well aware that a complete history of their subject cannot be written in 400 pages—that Aquinas, for instance, cannot be disposed of in four pages and Augustine in nine, or that a description of the styles and a synopsis of the stories of these men cannot even begin to suggest the character of their thought. But they have proceeded blithely nevertheless; have done all they could; and, since they have written well, have produced an invaluable handbook on their period. Mr. Wright, famous as a translator of late Latin poetry, seems to be the author here of many fine verse translations, and in general it may be said that the sections on belles-lettres are more satisfactory than the sections on philosophy. Nowhere else is there at present so readable an account of that Europe which between Ambrose and Milton spoke, thought, and read one language.

Shakespeare's Tragic Heroes: Slaves of Passion. By Lily B. Campbell. The Macmillan Company. \$5.50.

Miss Campbell treats the tragedies of Shakespeare as studies not of action but of passion, and ransacks the medical and philosophical literature of the sixteenth century in order to discover what Shakespeare might have read as well as known about "the passions." She decides that Shakespeare was familiar with this literature and that he built up his tragic heroes with its aid. Hamlet, for instance, he made a slave of grief, describing him in this condition as any sixteenth-century student of psychology might have done. Lear's passion is wrath in old age, Othello's jealousy, and Macbeth's fear. The book is interesting and up to a point convincing. Miss Campbell may be pardoned for finding more intention of a particular sort in Shakespeare than anyone else will; in the course of her researches she has thrown light upon many neglected passages in Shakespeare, and has given a plausible account of his general view of human nature.

How They Win Elections in Hungary

By FRIEDRICH SCHEU

Vienna, July 6

ON Sunday, July 28, the first of the three days on which the elections for the Hungarian parliament were held, I traveled by car with another journalist and a Hungarian Socialist deputy through southern Hungary. Police armed with rifles were prominent in every town. From time to time our car was stopped by the police and we were peremptorily asked who we were and why we were there. We answered that we were visitors from abroad on our way to the town of Bekes Szaba. Bekes Szaba was described to me by our Hungarian guides as a typical constituency with the "open ballot." Only 46 constituencies in the large cities vote by secret ballot. In the 199 rural constituencies the vote is open. We had come to see how elections were conducted in a country where a parliament is maintained for show purposes, but where the government has no real intention to let the will of the people prevail. The people of Bekes Szaba are small peasants and agricultural workers with traditionally Socialist leanings.

It was rather remarkable that a vote took place at all at Bekes Szaba. If you want to stand as a candidate in Hungary, you have to present a candidature paper signed by 10 per cent of the electorate. This means that you have to procure the signatures of several thousand persons who are not afraid to support the opposition party and let the local aristocrats know it. The local lord is either himself the government candidate or a close friend of the candidate. The election date was purposely fixed so that very short notice could be given, and there was only about a week for the collection of the signatures. Collecting signatures or holding meetings before the dissolution of the old parliament was forbidden. All campaigning during the week immediately preceding the election was also forbidden "for reasons of public order." Propaganda by posters was forbidden—posters might contain the names of the candidates only.

In a number of towns which we passed through we saw posters bearing the names of government and opposition candidates. Nevertheless, in several of these towns the government candidate was returned unopposed. We learned that in these towns the election officials had, one or two days before the poll, found errors in the opposition signature lists. No government signature list was found to have such errors. The opposition maintains that an enormous number of government signatures were faked. In several places it is maintained that the government lists contained more names than there were voters in the whole constituency. Prominent opposition leaders found their names in the government signature lists. There is no appeal against the decision of the election commissioners declaring an opposition candidature void. The Hungarian Premier, Count Bethlen, secured the unopposed return of about sixty of his supporters in this fashion.

On reaching Bekes Szaba we were stopped at the entrance of the city by a man who informed us that he was

a detective. He gave us orders to proceed to the Town Hall immediately. The approach of the foreign journalists had been telegraphed by the Minister of the Interior to the Bekes Szaba police. We later found that we had been preceded by similar telegrams wherever we went in Hungary. County presidents, local judges, and election commissioners were busy relaying every one of our moves to one another. I have not met this procedure in countries where governments have a good conscience on election day.

Six Socialist organizers had been arrested at Bekes Szaba. They were released as soon as the news of our arrival was received. The arrest had been a mistake, we were politely told by the police. At Szarvas all bicycles belonging to Socialists had been confiscated in the morning, so as to make campaigning difficult. We never learned whether this had also been a "mistake."

Votes are cast by open verbal declaration. But you cannot just walk into your polling station and say whom you want to vote for. Voters must enter by "groups" sorted according to the candidate they "belong to." A group of twenty Socialist voters and a group of twenty government voters are alternately led from their "meeting places" to the polling station. If there are not sufficient Socialist voters waiting, then another twenty government voters are led in instead. I found that the Socialist meeting places had generally been fixed by the election commissioners at points far away from the polling station, and in several cases in spots where the sun scorched the unsheltered voters. Often, on the way to the polls, one or two of the Socialists were arrested, and the whole crowd was then sent back as a punishment for being "less than twenty." In several cases I could verify the opposition charge that more than twenty government voters were let in each time. In other cases, the Socialist turn never came at all.

Inside the polling stations the peasants and workers were shouted at like a herd of unruly sheep by the commissioners. I could not understand the words of the commissioners, but it was easy to see how they must have frightened such simple and illiterate peasants. I saw Socialist voters rejected for various reasons. On account of the absence of unemployment insurance many persons received some sort of public help during the past winter, if it was only a sack of potatoes. All such people were rejected. Others were belittled at for not understanding the Hungarian language—many of the Bekes peasants being Slovaks.

At four o'clock, to my surprise, the voting was declared closed by the commissioners in the working-class wards which we were visiting. I learned that the commissioners were permitted to end their work if there were "no more voters waiting." On coming outside, I found the streets crowded with Socialist voters who had been kept waiting for many hours at their meeting places, while only groups of government voters had been allowed in. These people were now tricked out of their vote altogether. They were promptly dispersed by the mounted police. At Szarvas we

were met by a crowd who complained that machine-guns had been pointed at them when they refused to disperse without having voted. In the well-to-do districts, where the government is certain of its majority, the voting was not ended, but continued until late in the evening.

I took photographs of voters being dispersed. A detective tried to place himself in front of my camera, but otherwise I was not molested. But a Hungarian Jewish journalist, who also took photographs, was at once arrested and his films were destroyed. The election commissioner himself came out into the street in all his glory to shout at the man, and what he said was translated to me as, "You dirty Jew, if you come here again you will be beaten up." Later on he was released. I have reason to believe that he would not have been released if foreigners had not been present.

I saw similar scenes on that day and the next in a number of towns in various parts of Hungary. Under the circumstances I am not surprised at the election victory of the government, but rather at the courage of the many peasants and workers who voted for the opposition, or at least attempted to vote, in spite of all odds. The spirit of the people, whose rights are not only suppressed but mocked at, is admirable. But I could picture what would happen if one day those peasants were to get the chance of taking their revenge on the local lords, the judges, and the election commissioners. Count Bethlen is building a nation of revolutionaries.

It is exceedingly difficult for the opposition to check the counting of the votes. Even votes cast for an opposition candidate may be put down by the election commissioner as having been for the government. In a certain polling station at Szarvas, where the peasant watchers were not allowed to make notes of the vote in writing, they checked the count in the following manner. One of them counted up to ten on his fingers. When he reached ten he nudged his neighbor, who held up one finger. Whenever a hundred was reached, the man who counted the tens in turn nudged his neighbor, who counted the hundreds on his fingers. When the count was finished, they found that the number of Socialist votes registered by the commissioners

was considerably smaller than that which they had counted. They had been cheated.

The herds of lean, shabbily clothed, and taciturn opposition voters which appeared before the commissioners were passive but stubborn. Each man and woman clearly and loudly gave the name of the Socialist candidate to the commissioner, though each knew what it would mean to him or her in future months. When one of these voters next comes to ask for city relief, or for tax instalments, he will be told by the officials what it means to have voted for the opposition.

No Socialists and no representatives of the liberal parties were elected in any of the 199 open-vote constituencies, although there is little doubt that many would have won, even under the open-vote system, if all voters had been allowed to vote. Count Bethlen himself has publicly said that the reason for maintaining the open vote is that the country might otherwise fall a prey to radicalism. Of the forty-five seats in districts in which there was secret voting, the Socialists won fourteen, other opposition parties twelve, and the government nineteen.

Murder and mutilation of political opponents are characteristic of the young days of a white terrorist regime. The singular technique that was used for engineering the recent Rumanian and Hungarian elections is the newer method of keeping reactionists in power. A significant result in Rumania and in Bulgaria was the large poll of the Communists, which is evident from the figures even as they appear in the government records. In Hungary, where no Communist candidatures were allowed, the more moderate Socialists profited from the revolutionary sentiment among the poorer classes. But it would be a great mistake to believe that in Hungary or elsewhere the spirit of moderation is engendered in the hearts of the people by the methods of the so-called parliamentary governments of Southeastern Europe. These governments have apparently learned nothing from the fate of the old regime in Russia. The agrarian world crisis is at present sapping their foundations. It is difficult to believe that the end of these governments will be peaceful, bloodless, and democratic. The specter of bolshevism is looming large on the horizon.

THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York. British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London, W. C. 1, England.

HAS WILLIAM GREEN changed his color and become Red? The question inevitably suggests itself after reading the remarks of the head of the ultra-conservative Federation of Labor to the Massachusetts branch assembled in its forty-sixth convention, in which Mr. Green demanded that President Hoover either call at once a conference of economists to remedy employment conditions or to admit that "the present economic structure of the country is an absolute failure." More than that, he warned his hearers that "there will be a rebellion of the army of unemployed which will upset our present political system unless industry and government cooperate with labor." We submit that this is playing with fire, that this is putting the most dangerous kind of suggestions into the minds of the masses, that these words will be retailed eagerly all over the United States by every red of whatever hue. In our alarm we solemnly call upon the Daughters of the American Revolution and upon Matthew Woll and Ralph M. Easley, proprietors of the Civic Federation, to do something about it right off, and to rebuke Mr. Green properly for his incredible recklessness and irresponsibility and his disloyalty in threatening the President of the United States. Since Mr. Woll is vice-president of the Federation of Labor he ought to feel especially shocked by this wicked apostasy of his lifelong associate. For ourselves, we hope that this was a momentary

slip due to the great heat. If not, and if Mr. Green has really taken to preaching rebellion and revolt, then, indeed, does treason stalk abroad in the land. Indeed, we have no doubt that it was the news of Mr. Green's utterances that induced 400 women and children to march upon Philippi—*absit omen!*—West Virginia, carrying banners reading "Children are hungry, must be fed" and demanding the release of 33 members of the United Mine Workers of America who are in jail for violating a judicial injunction while their wives and children starve.

SENATOR JAMES COUZENS is another traitor. He has again made a public speech that times are not going to be any better, but much worse next winter, and has demanded that the President call Congress in session not later than October 1, so that it may immediately pass moneys for a federal relief to the unemployed. Now Senator Couzens is obviously no parlor pink, nor editor of a liberal weekly, nor a down-and-out, since he is one of our great millionaires. Perhaps it is the fact that he has espoused the platform of the wicked *Nation* that induced President Hoover to send in hot haste for Julius H. Barnes and Silas Strawn, of the United States Chamber of Commerce, to discuss the unemployment situation with them and to take steps to head off any possible action by Congress. Mr. Strawn sees the danger clearly. He declared on leaving the White House "that the fear of dole legislation was very real, and that unless some concrete plan was ready before December, when the next regular session of Congress opens, there would be demands for 'more socialistic legislation of one kind or another than was ever conceived of in England or Germany'" —thus runs a dispatch in the *New York Times*. We submit that the first step to take is to get rid of men like William Green and Senator Couzens, and to lock them up somewhere to end their unpatriotic and dangerous talk, and the next thing is to prepare legislation at once which will show us how and when a dole can be not a dole. Last week Mr. Hoover was sure that a "coordination relief policy" under the lead of the United States Government was all that was required; now, it is a heading-off policy which we seem to require.

FROM THE STANDPOINT of the Fish committee and all our other anti-Soviet alarmists, our detailed foreign-trade figures must continue to be a source of painful embarrassment. In June of this year, for example, our exports to Soviet Russia in Europe amounted in value to \$12,600,000, an increase of 43 per cent over our exports to Russia in June a year ago. This was not only the largest increase in our exports to any nation, if we except that in our exports to China; it was the *only* increase in exports to any of the leading nations. It compared with a decrease of 36 per cent in our total exports in the same month. Incidentally, our exports to Russia in June were higher, probably for the first time on record, than our exports to Germany; they were exceeded only by those to Canada and to Great Britain. All this in spite of the fact that our State Depart-

ment, in a time when our foreign trade is at the lowest level in years, has done everything possible to alienate Russian trade and drive it to other countries. What about Russian imports—always referred to in Washington as Bolshevik “dumping”—about which there has been such a terrific alarm and hullabaloo? They amounted, in June of this year, to \$1,400,000, little more than half of their total in June a year ago, only about one-ninth as large as our sales to Russia, and lower than the imports from any one of twenty-two other countries.

THE DEVELOPMENTS in the first few days after the reopening of the German banks proved to be more reassuring than most informed observers had had the courage to hope for. Instead of the “run” that was feared, there was an excess of deposits over withdrawals. This evidence of confidence in itself acted to create more confidence, and the failure of the Prussian referendum removed still another cause of concern. But the immediate German financial situation is far from a solution. Foreign-exchange operations are subject to restrictions on all sides, the problem of the Boerse and of the savings banks has not been solved, and industrial and commercial failures can only follow if the discount rate is long maintained at its present appallingly high level. It is to be hoped that the next development will be a slight lowering of this. Meanwhile the Wiggin committee has begun its study of the German financial situation. In England the break of sterling exchange immediately after the announcement of the \$250,000,000 credit from the Bank of France and the Federal Reserve Bank of New York was disquieting; its cause is still a mystery to most European and American bankers, and it seems likely that the situation was in some way mishandled. Apparently the British Treasury imagined that no part of the new credit would have to be used. This was not in itself an extravagant hope, but it is customary, when stabilizing credits of this type are arranged, for the authorities to stand ready to buy all exchange offers at some fixed rate definitely above the gold point, and the Bank of England apparently was slow in making this arrangement.

IN ITS REPORT on official lawlessness the Wickersham Commission has seen fit to suppress that section dealing with the Mooney-Billings case. It was explained by the commissioners that certain legal technicalities prevented them from publicly discussing the case. For example, “this Commission,” they said, “was not appointed to sit in review upon the judgment of the courts of any State.” This may justify the Commission’s action, but is it not true that almost all official lawlessness can be justified by one legal quibble or another? Moreover, we are curious to know why, if its position is correct, the Commission appended a special account of the Mooney-Billings case to its general report in sending the latter document to the White House. Why did this report emerge from the White House, not from the Wickersham Commission, with the special account deleted? No hesitancy in condemning other kinds of official lawlessness is shown in the report. It states unblinkingly that “the third degree is widely and brutally employed in New York City,” and offers substantial evidence in support of this sweeping assertion. Moreover, the Commission’s investigators found that foreign-born, Communists, Negroes, and similar groups were the chief sufferers from the police tortures, and

not the professional criminals as is popularly supposed. Chicago’s record in this respect was found to be even worse than that of New York. The correction of this evil would do much more to curb radicalism than could possibly be accomplished by the deportation of all the alien radicals in the United States.

ONLY 97,139 IMMIGRANT ALIENS were admitted to the United States during the last fiscal year, which ended June 30—the lowest number since the Civil War, and a falling off of 144,561. This decrease was not all, of course, due to the bad times abroad, but in large measure to the extra-legal functions exercised by our consular officers abroad, under the direction of President Hoover, in withholding visas from persons who were in every way eligible to enter under the existing law, but were denied because the President did not wish to add to American unemployment—another vicious example of the Executive’s interpreting and modifying statutes to suit his own taste. The decrease in immigration may be measured by the fact that in 1924, 706,896 aliens were admitted. Moreover, 61,882 immigrant aliens left the country to return to their native land, so that the net increase was only 35,257, a small enough figure surely to satisfy the most ardent nationalists and the most eager believers in the theory that all our troubles will be ended, and every citizen be happy, content, and 100 per cent satisfied with the United States if only foreign immigration is shut off. Deportations, too, reached a high-water mark, 18,142 aliens having been returned, an increase of 1,511 over the previous year. It is gratifying to note that the Wickersham Commission has demanded that Congress set up an independent court in which all charges made by the Immigration Bureau against aliens shall be impartially heard and determined. Of course it is an outrage that the Immigration Bureau officials should be investigators, prosecutors, judges, and a final court of appeals in deportation cases, and take their orders from men of the type of William N. Doak.

THREE NEGROES HAD TO DIE before Chicago awakened to the fact that we are in the midst of a grave crisis. Last spring a member of *The Nation* staff visited that city and found its officials and civic leaders wholly indifferent to the seriousness of the unemployment problem. They continued to treat the situation lightly until the restlessness among the unemployed resulted in a riot among the Negroes on the South Side. These people had banded together to put a stop to the eviction from their homes of many families who no longer can pay rent. They were met by a riot squad of police who, according to eye-witnesses, opened fire upon the crowd without warning or cause. Three men fell dead. Immediately the city was aroused. Mayor Cermak hastened home from his vacation. He called upon Governor Emmerson to have the State militia ready for further trouble. His police department blamed the Communists and threatened to arrest all known radical leaders in the city in the event of renewed rioting. Fifteen hundred policemen were sent into the Negro district. But apparently the three men did not die in vain. Mayor Cermak has demanded that the evictions cease. The newspapers have dropped their usually calloused attitude, and are asking that something be done for the unemployed. Reading between the lines of their editorials one notes a

fear, as the Federated Press put it, "that white workers will react as the Negroes have." Pressure from various conservative quarters is being brought to bear on the city administration, and as a result there is now some hope that the municipality will adopt a dole system for the coming winter.

THAT ACADEMIC FREEDOM at Ohio State University "has been destroyed" by the dismissal of Professor Herbert A. Miller is the conclusion of a committee appointed by the American Association of University Professors to investigate the dismissal. The committee's report completely vindicates Professor Miller of the charges brought against him by the university's board of trustees. But the report does not stop there. It goes on to declare that the attitude of the trustees in this case "is directly opposed to sound public policy, to good educational practice, and to long-established university ideals." Until the trustees correct their attitude, the report continues, they "cannot assert that freedom of speech prevails at Ohio State University." Lastly, the committee calls for the reinstatement of Professor Miller as a token of good faith on the part of the university authorities. We hope that until this is done members of the Association of University Professors will refrain from accepting appointments at Ohio State.

ENCOURAGING NEWS has come to us from Haiti. According to the United Press, an agreement has been reached whereby three of the government departments now under American control are on October 1 to be turned over to Haitian officials. This suggests that Washington is moving more rapidly toward complete withdrawal than had earlier been indicated. The three departments involved are the public-works office, the department of agriculture and industrial education, and the sanitary service. A few Americans are to be retained, but they will stay on only in an advisory capacity. After October 1 Americans will still be in charge of the finance and customs offices, and of the native police. Another satisfying feature of the new agreement is the section abrogating the accord of August, 1918, under which the Haitian Government had obligated itself to communicate all projected laws bearing on the 1916 treaty to the American commissioner before they could be presented to the legislature. Other important changes in Haitian-American relations of a like nature were incorporated in the agreement, while a promise was made that the question of the control of the native police, now under the command of the United States marines, would be taken up in the near future.

THOSE WHO HAVE FEARED that the Spanish Republic is now only in the "Kerensky stage" of its revolution may not be entirely wrong. There has been a constant drift toward the left ever since Alfonso packed up and hastily departed his fatherland. This tendency has been apparent among the people for some time, but lately it has become equally noticeable among the political leaders. The parliamentary commission which is writing the new constitution has decided, for example, to ask the Cortes to expel all religious orders and to confiscate all church property. Urged on by the Radical Socialist minority in the Cortes, the commission is preparing a bill to accomplish this purpose. As the church is the largest single property-owner in the country, it would be a simple step from the

confiscation of its wealth to the sequestration of the wealth of other large property-owners. Revolutions in countries that have no effectively organized and disciplined moderate parties usually move that way. Meanwhile there is talk of a split in the present coalition government, the economic situation worsens, the peseta continues to fall, and strikes and strike disorders continue to spread. The immediate future of republicanism in Spain appears none too bright.

FORTY THOUSAND WORKERS' HOUSES are to be built in a year under the provision of the British Government Housing Act, which became a law on July 29. The houses are designed for agricultural laborers and are to be rented at a rate of about eighty-four cents a week, and they are to be financed by an advance of \$10,000,000 by the government to the municipalities. Nor will the latter sum be in any way an extravagance, since it is estimated that 100,000 men now on the dole will be employed in the construction of the dwellings, and some \$25,000,000 will be saved to the government thereby. This scheme, offering as it does relief to several needy groups at the same time, is so simple and so effective that one wonders why our own government does not adopt a similar plan. We have not, it is true, hundreds of thousands of men living on government unemployment insurance. But it is altogether likely that many millions of dollars will be asked from and perhaps appropriated by Congress for relief during the coming winter. This will not, of course, be a dole. Perish the thought in a ruggedly individualistic American civilization. It will be given for public works, or simply for soup kitchens and other means of ameliorating intolerable conditions. Somehow the British scheme, whereby workers are given a place to live by the labor of other workers out of a job, seems a little closer to the realities.

IN AN UTTERLY CHANGING WORLD there is always Great Britain. What other country would in this day and generation have reinstated so delightful an institution as the Dunmow Flitch trial, established in 1445 to award a flitch, or side, of bacon to any couple which could prove before a jury of six maids and six bachelors that they had lived happily for one year and a day. That would seem to indicate that marriage was not always blissful in the fifteenth century, when life was simple and there were no modern improvements and no movies and few theaters, and no one had ever advocated that dreadful emancipation of women which has done so much to undermine the morale of all human kind. The jury was reconstituted this year, and last week awarded two flitches and a half to three couples who claimed the award. The second couple was composed of a motor mechanic, whose hobby is wireless, and his spouse. The judge was greatly interested. "You know," he said, "Adam, too, went in for wireless. Yes, he exchanged his spare part for a loud-speaker." After that witticism the verdict of the jury was unanimous, but because their marriage had occurred at the Registry Office only and was without benefit of clergy, this happy couple received only half a flitch. Incredible as it may seem, the third pair of applicants were able to prove that though married they were laughing and happy every minute of the day, so the verdict was unqualified in their case. Will not somebody offer a Dunmow Flitch on this side of the water?

Prussia's Good Sense Victorious

THE good sense of the Prussian people has triumphed. They have unmistakably shown that they prefer the stability of the present government to the uncertainty of some new and untried order. They would rather have the level-headed Otto Braun as their premier than someone taken from the extreme right or left. They have refused to jeopardize the existence of the German republic at this critical moment despite the almost overwhelming temptation to take drastic action. No other people in the western world today are as sorely beset with hardships and suffering as are the Germans; no other nation is faced with such grave economic problems. Yet when they were put to the test the Prussians showed that notwithstanding their terrible trial they could exercise a magnificent measure of self-control. That is the major significance of the vote of August 9. The proposal to dissolve the Prussian Diet, which was advanced by the Steel Helmits and other right extremists and supported by the extremists of the left, was not merely defeated; it was defeated overwhelmingly.

The action of the Prussians should earn for Germany not only the applause but the confidence of the world. And it is this confidence which Germany must have lest it succumb to the menacing economic situation. Without it even the splendid self-control revealed in the voting may not suffice to carry the country through the present crisis. Witness only the disturbances that took place on the day of the voting. The number of dead in Berlin alone is estimated at thirteen or fourteen. The rioting clearly does not represent the sentiment of the majority in Germany, but it is symptomatic of a feeling of unrest directly attributable to the economic distress. It is this distress that must be overcome, and that soon, or the restlessness will surely grow. The Prussian people have said to France in particular, but also to the rest of the world, we shall remain cool and calm, we shall do all we possibly can to keep our extremists in check, but we need your aid, or at least your confidence, in our endeavors to correct and remove the conditions which have led to these excesses.

France was alarmed by the referendum, or in any event its politicians declared they were alarmed. "Paris Anxious" and "Paris Sees Danger," the headlines said the day before the voting. The nationalist press of France pretended to see in a possible victory for the German Nationalists a serious threat to the security of France. Visions of the peace treaties being torn up, and of a militant Germany planning a war of revenge, were flashed before French readers. But the French politicians were needlessly alarmed. The Prussian referendum was solely a domestic affair. It had no direct significance for France or any other country, and even indirectly, had the extremists won, it would have meant no more than that the Germans were determined to have the crime committed at Versailles rectified a little sooner than will otherwise be the case. The Germans are not threatening the security of France; they are not planning a war of revenge. Anyone familiar with popular and official sentiment in Germany today knows this well enough. Moreover, whether Paris and its satellites like it or not, it is obvious that the

end of reparations is all but at hand, and that the Treaty of Versailles must soon or late be radically altered, no matter what faction happens to be in power in Germany or Prussia.

It is unfortunate that the voting in the referendum was not by parties. Since it was not, there is no way in which we can estimate the relative strength of the various extremist groups. Berlin dispatches say the outcome showed the strength of the Nationalists and National Socialists to be declining, and an analysis of the returns appears to bear this out. It must be considered an encouraging sign. Yet it is not clear what influence the last moment decision of the Communists to participate had on the voting. For eight weeks the Communists bitterly opposed the referendum on the ground that it was a "social-fascist" device aimed especially at their campaign for a social revolution. Then a fortnight before the voting the left radicals suddenly presented the Prussian Government with a set of impossible demands, declaring that their rejection would mean Communist support for the Nationalist referendum. Premier Braun calmly replied that he did not intend "to make the question of public order a subject of political barter." His decision was not only sensible and statesmanlike, but it was politically wise as well, for apparently the Communist rank and file did not follow their leaders to the polls. This is strongly indicated in the returns from Berlin, where the Communists are particularly strong. The division among the left radicals and the slump in the voting strength of the Nationalists we believe to be of more importance than the fact that the extremists were able to roll up almost 10,000,000 votes for their proposal. It is true that the crisis has not yet been passed, and that political stability has not yet been permanently assured. But the victory of the moderates is a more valuable guaranty of stability than any Germany has yet been able to offer to the world.

The extremists have had their day, and have been found wanting. They will undoubtedly carry on their propaganda, but their efforts will be weakened by the knowledge that they lack the popular support which they might otherwise have pretended to. This is one of the merits of the German initiative and referendum. Under that system the people themselves can initiate legislation, reject legislation adopted by their representatives, or bring about changes in the personnel of their government. All that is needed is a petition signed by 10 per cent of the qualified voters, upon presentation of which the government is legally bound to hold a referendum. The question then goes to the people as a whole, and is carried if 50 per cent of the qualified voters cast affirmative ballots. Some such system would be a splendid thing for the United States. Then we could, for example, challenge the contention of the Hoover Administration that the American people are opposed to government help for the unemployed, or are opposed to unemployment insurance. The Germans have not only the good sense to reject the dangerous appeals of their extremists, but they have the courage and the wisdom to give these extremists an opportunity to test their strength by the ballot box.

Disarmament Both Hot and Cold

JUST when Mr. Hoover has been so ardent in publicly stating that there must be disarmament, and linking his every action for the rescuing of Europe with disarmament, comes the disheartening announcement of Secretary Adams, with, it is stated in the dispatches, the consent of President Hoover, that the navy adopted a "new policy" for a fleet that "in every important respect will conform to the provisions of the London Treaty for the Limitation of Naval Armaments." In other words, we are to build up to the British strength just when the times are bad and Mr. Hoover has been berating every bureau chief for not having cut rigidly his estimates for the next fiscal year; and so we are to have two new aircraft carriers, six fleet-submarines, one flying-deck 10,000-ton cruiser, one London-treaty six-inch gun cruiser of about 10,000 tons, one destroyer, one destroyer-leader, and complete airplane equipment for the aircraft carrier *Ranger* now under construction, the whole to cost \$129,385,000. It is officially announced that the purpose of the Administration is "to create, maintain, and operate a navy second to none and in conformity to treaty provisions," that the program will be approved by the bureau of the budget and the President, and will give employment to thousands of men, a large part going in wages "to skilled mechanics and other workers in the shipbuilding and ordnance trades."

The last argument for this expenditure is similar to that made by Ramsay MacDonald when excusing the building of cruisers by the first British Labor Government. It cannot be justified on that ground. The real reason is, we suppose, the stupid old one that the President thinks we must have something more to "bargain with" when we enter the disarmament conference next February. It is that incredibly mad military and naval mind at work again of which Professor Ross of the University of Wisconsin speaks in the article printed elsewhere in this issue of *The Nation*. The plan, of course, will have no such effect as is intended. In the first place, it is too obvious, too transparent, and too openly stated. In the second place, it will stir up all the admirals, the Navy League, and the professional imperialists in Great Britain. In the third place, wherever it is read under the sun, it will cast doubt upon the sincerity of the disarmament position of Herbert Hoover. It will be said of us abroad that we are no more sincere in our advocacy of genuine disarmament than are the French. At home it ought to be clear that money spent upon any such program in this time of acute national distress, when the President himself has said that we must rigidly reduce our expenditures, would be nothing less than a criminal waste of public funds. Fortunately, it is yet to be authorized by Congress, and we hope that Congress will take the bit in its teeth under pressure from public opinion and will refuse to be misled by the specious argument that this throwing away of money upon armaments that will be worth nothing five or ten years from now should be sanctioned in order to give employment.

We confess that Mr. Hoover's policy in this matter

leaves us gasping. Perhaps it is to be explained by the charge made in the new "Mirrors of Washington" that Mr. Hoover is greatly influenced by the last person who is with him. How can he again make an appeal to an international body, as he did in his address to the International Chamber of Commerce last May, in behalf of disarmament? If Mr. Hoover were a true statesman and a true Quaker, he would now be saying to Europe: "Gentlemen, we ask you to disarm. If you do not, we are going ahead on our own. We are not afraid. For more than one hundred years of its existence when it was poor, weak, struggling, torn by internal dissension which finally led to a bloody civil war, and when it was creating homes for its people in the once trackless wilderness, this country had no fleet, and its army never exceeded 25,000 men save in war times. It was undisturbed, and never attacked, although its thousands of miles of coasts were for generations absolutely defenseless, and could have been taken at any time by the French, British, or Russian navies. It is now going back to its historic American policy with all the more courage and cheerfulness because it demonstrated during the World War that it had the most magnificent resources in men, materials, and wealth of any country in the world. It considers itself unassailable today. It proposes to devote its wealth in this emergency to reconstructing its economy and to keeping alive and content the millions of unemployed and starving men, women, and children within its borders. It will leave to others the un-Christian policy of squandering its national wealth on plans to kill, which can have only one outcome if persisted in—the destruction of the present economic system, and the establishment of a totally different one." If Mr. Hoover could say this the whole country, yes, the whole world, would rise and acclaim him.

Our Police Failure

ANOTHER chapter of the Wickersham Commission's findings just published deals with the police of the country, and in no uncertain terms. The report is all the more striking in the completeness of its denunciation since it comes from no muckracking daily, but from a sober and conservative board of inquiry appointed by the President of the United States. It declares that there is a "general failure" of the police because of political corruption and alliances with criminals, inefficiency, frequent changes of the head of the police, usually for political reasons, incompetent personnel, bad training, and inadequate equipment. This is, of course, precisely what everybody at all familiar with the police situation expected to learn. The facts are there, and they have been available to everybody for decades. Now the question is once more what are we going to do about it.

The truth about our police work is not only that it is subject in our large cities to the all-corrupting influence of the political machines whatever their political names or tags, but that it has grown up haphazard and without adequate relation to the modern development of crime and criminals. Many of the functions of the police have nothing to do with crime detection—such, for example, as patrolling parks and regulating traffic. The officers of each force, and its crime detectors, are recruited from the lower ranks, from members

who spend their time directing automobiles or pounding the pavement, waiting for something to happen. Even in New York City it is the custom to reward a brave patrolman who has made a fortunate arrest or distinguished himself in hand-to-hand combat with burglars by promoting him to be a detective, as if shooting a burglar or the accidental detection of a crime connoted the possession of the qualities of a good detective.

What the situation calls for is the separation of the regulatory functions of a police force from its activities against criminals, the removal from it of all political influence, and its reorganization so that a career may be possible within its ranks and that men may enlist in its service without necessarily having to begin as patrolmen. The police need good chemists and men of highly trained brain power, capable of taking a broad view of the relations of the police to the whole citizenry, and particularly of such questions as free speech, free assembly, and the more and more complicated relationships, political and civic, of the individual to the community. It is infinitely more important that the officials at the head of the police should have an understanding of their own responsibility to the law than that there should be an up-to-date riot squad with sawed-off shot guns and tear-gas bombs. If we have a criticism to offer of the Wickersham report it is that, so far as the published excerpts are concerned, it has laid no stress upon the grievous fact that the police not only arrogate to themselves the right to say who shall and who shall not observe the laws, but do not hesitate themselves to violate them whenever it suits their convenience. Few policemen respect the individual right of sanctity, never to be violated without a search warrant, or hesitate to take or to threaten lawless measures themselves, or to disregard and to defy upon occasion the Constitution of the United States itself. To our mind this is the greatest of the evils connected with our police, for they cannot hope really to enforce the laws unless they themselves respect and obey them.

Naturally the police should be taken out of politics, and at least a fraction of the major offices should be opened to men of the highest education and of the best possible standards, without regard to their previous occupations. The Wickersham Commission is quite correct in stressing the evil of the constantly changing police heads. On the other hand, it is not easy to get good police heads within the ranks when the forces are as corrupt and ignorant as most of them are. Of course, taking a man like Grover Whalen in New York from civil life does not necessarily mean the choice of the right kind of Commissioner. As long as we have political mayors we shall have ignorant or political chiefs of police. Until we have professional mayors of the German type, or mayors wholly free from political influences like the British, we shall have political chiefs of police with all the evils the Wickersham Commission stresses. At best the police problem is enormously difficult. The mere putting of men into close grips with the criminal world tends to corrupt them—first pity, then endure, and then embrace, that is the rule here as well as in other walks of life. It is of the utmost importance that a new policy be attempted in order that our police shall be like the English policemen—the best friends of the community as well as its servitors and defenders, and, above all, beyond suspicion themselves.

A Mental Moratorium

IN recent months foreign observers, such as André Maurois, have professed to discover that the business depression has caused Americans once more to turn to the things of the spirit. In 1928 and 1929, they say, we were interested only in money-making, but since evil days have fallen upon us there are signs of an intellectual awakening. One would like to believe that this diagnosis is correct, but the evidences of it seem to us somewhat less than glaring. Outside of the economic realm there has been, so far as one can judge from external signs, less serious thinking than at any time in the last decade. Most persons who follow the output of publishers, for example, will agree that there have been fewer serious and genuinely important new fiction and non-fiction books in the last twelve months than for at least five or six years. This seems to be the situation not only in the United States but in most of the countries of Europe. It is a condition not difficult to account for on economic grounds. Most serious books can depend only upon a small audience, and volumes of poetry and fiction that are in any courageous way experimental are for that very reason less sure of an audience and more speculative from the publisher's point of view. The publisher, therefore, not only restricts his total output of books in a time of depression like the present, but is most likely to make his restriction at the expense of the volumes that lack mass appeal.

What is perhaps at first glance more remarkable, is that readers for the most part have justified the recent policy of publishers by purchasing mainly books of a trivial nature. A recent list of the "six best sellers" in fiction reveals only one volume—"The Good Earth" by Pearl S. Buck, ranking fifth in sales—in which leading critics have acknowledged genuine literary merit. The rest are mainly light love fiction, with the exception of a wild west yarn. The six non-fiction best sellers include two books on contract bridge and a book on "Boners." No one would be likely to hold that the list as a whole proves the country to be in a state of intellectual ferment. Certainly several publishers, whose business it is to be exactly informed on such matters, are making their plans on precisely the opposite assumption. Under different firm names, they are planning to publish a list of more frivolous and frothy fiction than they would apparently care to publish under their present respectable and long-established imprints.

The moral is rather plain. It may be true that a country can become too rich for its own intellectual good—that it cannot whole-heartedly pursue the goods of commerce and the goods of the spirit at the same time. But it is unfortunately too much to hope that the sudden advent of hard times will produce an immediate intellectual renaissance. Most people apparently, when they have lost their money, do not care to turn to something that will put any real strain upon their mental or emotional faculties; they prefer rather to read something shallow and "cheerful" that will "take their mind off their troubles." Thinking has always been an arduous and to most of us a painful enterprise, and even when it seems most necessary, we look around for opiates and not for prods.

President Hoover's Record

IX. Hoover the Politician*

By PAUL Y. ANDERSON

WHEN a man is President, nothing succeeds so brilliantly as success and nothing fails so abysmally as failure. The office has grown topheavy. Under a succession of Presidents, some of them strong men hungry for power, and some of them weaklings egged on by powerful interests with axes to grind, the executive has encroached upon the legislative branch of the government until today the House of Representatives is a mere partisan mob and the Senate wages an unpopular and perhaps a losing battle to preserve representative government. The President, through his power of appointment, largely determines the character of the judiciary. Hence in the main we live under a sort of White House Pooh-Bahcracy, and hence everything the Pooh Bah does or fails to do is thrown up on a gigantic screen, magnified out of all proportion. Every act of common sense becomes a stroke of genius, and every gesture of common decency stamps him as another Lincoln. His sins and blunders are exaggerated on a somewhat smaller scale, but they are either exaggerated or denied.

This perilously inflated status is a legacy which every President inherits from the long line of his predecessors, and it presents to him a vital political problem. The accepted doctrine is that he can handle it successfully in either of two ways. One is to assume the role of a bold, independent, self-reliant character, such as Roosevelt or Wilson. The other is to follow the routine of practical politics, playing the game with the party leaders as McKinley and Coolidge played it. Obviously, the first course requires more courage and ability, promises higher rewards, and involves greater hazards, while the latter course is safer.

Herbert Hoover has made the fundamental error of attempting to occupy both roles. Publicly he has sought to give the impression of a high-powered executive, impatient with politics and contemptuous of politicians. Under the surface he has played politics incessantly, and he has elected to play it on a singularly petty and vindictive plane. As associates he recruited a nondescript collection of adventurers, nonentities, and political hoodlums, and he condoned, if he did not actually instigate, a series of enterprises worthy of the Chicago school of "Hinky Dink" and "Bathhouse John." Still posing as the Scientist in Politics, he put at the head of the Republican National Committee Claudius Huston, an obscure promoter, who subsequently was exposed not only as a power lobbyist, but as one who had used lobby funds intrusted to him in his private stock speculations. Still pretending to despise politicians, the Great Engineer took for his party generalissimo Bob Lucas, a tinpot Louisville boss, newly graduated from a machine notorious for its roughhouse tactics.

The effort to present two faces, one to the public and the other to the politicians, could have but one outcome. The politicians immediately discovered that he did not know

the ropes, and the public presently realized that the Miracle Man was an illusion. As a matter of fact, Hoover is constitutionally unsuited to either role—which means that he is constitutionally unsuited to the Presidency. That he possesses certain virtues and abilities is not to be denied. He is an industrious man, with an excellent penchant for routine, and is extraordinarily well informed on a variety of subjects. Put him on a straight administrative job where he has absolute authority, and he can perform brilliantly. Thus situated, and free of vexations, he is likely to be extremely affable and entertaining. But he is peculiarly a fair-weather performer. By temperament an autocrat, opposition enrages him and fills him with a sense of personal injury. Cleveland, Roosevelt, and Wilson were autocrats, but they were fighters. Hoover is irascible and flabby. To borrow from the language of the prize ring, "he likes to pass it out, but he can't take it." The moment he is hit he starts backing up. Often a mere threat will cause him to retreat.

Take the celebrated instance of Hiram Johnson and the diplomatic dinner. That Hoover and Hiram hate each other like poison is common knowledge. On the afternoon preceding the dinner the list of invited guests was handed out at the White House, and the reporters discovered that Johnson was the only member of the Senate Foreign Relations Committee whose name was missing. The omission, if intentional, was very pointed indeed, and properly was a juicy piece of news. Questioned, Secretary George Akerson assured the reporters it was intentional. He said the President had a right to select his own dinner guests, and that he did not choose to invite Senator Johnson. Some of the more cautious journalists telephoned Akerson at home that night and received the same answer. The next morning the story was in all the papers. Much commotion ensued at the White House, and presently the astounded correspondents were officially informed that the failure to invite Hiram was not intentional, and that the President had sent him a note apologizing for the "inadvertence." It was further explained that instructions had been given to delete the name of Nelson Johnson, a State Department attaché, from the guest list, and that Senator Johnson's name had been deleted by mistake instead. The brightness of this afterthought may be judged from the fact that the correspondents were able promptly to ascertain that Nelson Johnson hadn't been invited either. Throughout the incident the doughty Hiram never opened his mouth or lifted his hand. It wasn't necessary—the enemy had surrendered before a return shot was fired.

It is doubtful whether any President has been so easily cowed. Threats of reprisal have caused him to make any number of important appointments which were thoroughly distasteful to him. Thus, after he had definitely decided not to reappoint Robinson and Sykes, comprising the "anti-trust" faction of the Radio Commission, a brief call by Senator Jim Couzens was sufficient to change his mind. A

* The ninth of a series of articles on President Hoover's record. The tenth and last, on Hoover as Business President, by William Hard, will appear next week.—EDITOR THE NATION.

similar hasty reversal preceded the reappointment of Eastman to the Interstate Commerce Commission, Couzens and Senator George Moses cracking the whip in that instance. Intimations of political reprisals caused him to put Richard J. Hopkins and Albert B. Watson on the federal bench after Attorney General Mitchell had reported unfavorably on their qualifications. When the President uttered his famous warning against "Congressional extravagance," and, by the transparent device of totaling the figures contained in all the appropriation bills which had been dropped in the hopper, proceeded to prove that the Treasury was about to be "raided" to the tune of five billion dollars, Senator Carter Glass retorted with a scathing denunciation containing the word "dishonest." Poor Jim Watson was in the midst of a labored speech justifying the Presidential strictures when a second statement arrived, explaining that the first had been misunderstood, and that Mr. Hoover had not intended to criticize Congress but only those wicked interests which were seeking to impose on its generosity. Jim's subsequent remarks in the cloakroom are still quoted with awe and admiration by those who heard them. To sum up, virtually all Hoover's essays at playing the Strong Man have run the same course. They begin with bluster and end in tears.

His efforts to play practical politics have fared no better. He does not understand the game, and seems totally unable to think his way through a situation in advance. Moreover, he is dreadfully handicapped by the personal hostility of most of his own party leaders. They believe that his attitude of superiority toward politics is a pose, and that his real distaste for it arises from his knowledge of his own ineptitude. A practical politician can get along with few abilities and fewer virtues, but certain qualities are essential. I do not recall a successful party boss of whom it was not said that "his word is as good as his bond," and that "he takes care of his friends." An equally obvious requisite is that instinct which causes its possessor to be known as "a good judge of men"—meaning that he bestows his confidence wisely. Concerning Mr. Hoover's word, I am decidedly unwilling to express the opinion that he would deliberately deceive anyone. The fact is that his temperament is so unstable and his judgment is so easily affected by outward circumstances that what he says in good faith today may not hold good tomorrow. He changes his mind oftener than he changes his shirt and with equal facility, and it is not always possible to follow the changes as rapidly as they occur. This trait is the cause of frequent embarrassment to his followers. After a singularly humiliating experience one Republican Senator bluntly announced that in future he would not undertake to pledge the President's word to his colleagues on any subject. Unfortunately, the question of his loyalty to his friends is not open to charitable interpretation. The list of "Hoover Boys" thrown to the wolves when their usefulness ended is sufficiently long and impressive to support the charge of ingratitude. From Colonel William Donovan down to and past poor Claudius Huston the story has been the same—Mr. Hoover's Presidential trail is strewn with the political bones of those who outlived their usefulness, until it is jocosely said in Washington that the only Hoover appointees who feel secure are those who have life jobs and Lawrence Richey. In the realm of practical politics there is no more damaging accusation. Treachery to one's friends is the unforgivable political sin.

Much praise has been uttered and written about Hoover's judgment of men, and I incline to the belief that it is merited within certain categories, but his choice of political aids and advisers has been uniformly unwise, and has involved him in endless difficulty. McNary of Oregon is by all odds the shrewdest member of the Republican Old Guard in the Senate. His judgment is sound and his information in advance of roll calls is uncannily accurate. Yet when McNary warned Hoover that the nomination of Judge Parker for the Supreme Court would be rejected and urged him to withdraw his name, Hoover elected to rest on the contrary assurance of the ineffably fatuous Fess, and so plunged on to one of the major political disasters of his Administration. Similarly, as his political "contact man" with Congress, Hoover chose Walter Newton, a Minnesota Congressman whose standing with the House leaders was indifferent and who was thoroughly unpopular in the Senate. To this strategist is attributed the ghastly blunder of permitting Joe Dixon's letter urging the appointment of Parker as "a master political stroke" to get into the file of papers which went to the Senate. Its discovery there undoubtedly caused Parker's defeat. Hoover's reasons for making Huston chairman of the National Committee are indiscernible to this day. Few of the party leaders knew him, and the rank and file of workers had never heard of him. When his record was bared by the Caraway committee, contributions to the party virtually ceased. Yet when he departed in disgrace the same inscrutable logic prompted Hoover to replace him with Fess and Lucas—and soon the country was being entertained with the story of Lucas's undercover plot to defeat the senior Republican Senator from Nebraska by circulating Ku Klux Klan literature against him!

In view of the foregoing, it is natural to inquire how Hoover could succeed in becoming President. The methods by which he developed into "Presidential timber" are best described by reverting to the language of the sports' page. He was a "built-up" candidate. The Hoover "build-up" consisted of the most elaborate and prolonged publicity campaign ever undertaken in behalf of a political aspirant in this country. He got his first great "break" in the war, and his inclusion in Harding's Cabinet enabled him to keep going. Not an opportunity was overlooked to get on the front page—or the second—or the sixteenth. His speaking engagements were carefully chosen to that end, and with the additional view to establishing "good contacts," especially with organizations of business men. He called numerous conferences and attended dozens called by others. Whenever a spectacular—and not too difficult—job was to be performed, whether in connection with a new industry such as radio, or in dramatizing flood relief, Hoover was quick to volunteer. Already the Great Engineer and the Man Who Saved Belgium, he managed to become the Great Organizer, the Great Executive, and the Scientist in Government. The ballyhoo never abated. Records kept by a reliable clipping bureau disclose that during the last two years of the Coolidge Administration the Secretary of Commerce received more space in the daily newspapers than the President of the United States—something which had never occurred before. Looking around now, it is rather difficult to recall the concrete accomplishments of those busy years, but one thing undoubtedly was accomplished: Herbert Hoover was "built up" in the public mind to a stage where, with the use

of an undisclosed sum of money in the Southern States, he was able to enter the Republican National Convention at Kansas City a heavy favorite. Bill Vare's anxiety to be with the winner produced the necessary additional delegates.

A Presidential nomination is not easy to win, especially when the candidate is distrusted by most of the party leaders. The Republican bosses have never regarded Hoover as a real party man. They have never forgotten that he got his start in politics under a Democratic Administration, and that in 1920 he was a candidate for both the Republican and Democratic nominations. At bottom most of them still regard him as an opportunist who managed to land at the top of the winning side. Considering his history and background and the mystery which enveloped and still envelops a long period of his life, surveying all the obstacles which he confronted, one is drawn to the conclusion that his successful campaign for the Republican nomination was his greatest

achievement. It was surely his greatest political achievement. Intelligently planned and skillfully carried out, it made him President, since nothing could have prevented a Republican victory in the election. It is Hoover's misfortune that the sort of politics which enabled him to attain the office is of little value in the exercise of its functions, especially in these times. Smug speeches no longer satisfy the business men—they cannot forget the red ink on their balance sheets—and all the White House gumshoe men cannot cover up the bread lines. No matter how many newspaper owners are invited to the White House or the Rapidan, the public still learns the truth. The situation can only be remedied by applying politics of the kind which is spelled with a capital P. That kind of Politics is reserved for men of imagination, wisdom, unselfishness, and courage. There is no ground for supposing that the jinxed and unhappy man in the White House will ever be that kind of Politician.

Speaking of Revolution . . .

By HENDRIK WILLEM VAN LOON

MISERY makes strange bedfellows. Herbert Hoover and *The Nation*, Inc., Nicholas Murray Butler and Karl Marx, G.M.B.H., Bishop Manning and Universal Religion Limited—surely the world was never quite so entertaining as it is today. We may not be able to get enough to eat this winter but we shall have plenty of laughs, so what is the difference?

I have left all my books in Veere. I shall have to quote from memory, and quoting from memory is like trusting a French time-table. But it was Ulrich von Hutten and the year was either 1522 or 1523. The place was the island of Ufnau in the Lake of Zurich.

What a spot to die in! God knows, it is bad enough to have to live in Zurich, but imagine dying there! For poor Ulrich was dying and dying under very uncomfortable circumstances. He owned nothing but the clothes on his back. Zwingli paid his doctor's bills. Everything he had ever tried to do had gone wrong. The idea of a united German empire, for which he had fought so valiantly, was further removed from realization than ever. The Reformation was rapidly degenerating into a free-for-all fight between half a dozen arrogant theologians, each one the author of a new and infallible set of doctrines. On all sides, murder and futile bloodshed and such slaughter of the innocents as the world had not seen since the days of Bethlehem.

And yet that poor knight-errant of the goose quill, just before he gave up the ghost, smiled happily and wrote: "It is a joy to be alive today . . . on every side the spirit of man is awakening."

When I was born we "knew" everything. Today we dare not even "suspect." The Czar of all the Russias and Little Father to all the Russians lies dead at the bottom of a well. The All-highest Kriegsherr is obliged to ask permission of some obscure Dutch governor of an unknown Dutch province every time he wants to go to town to have his hair cut or his teeth filled. His Most Catholic Majesty is shooing away the dirty-postcard vendors in front of the

Hotel Meurice every time he walks to the Paris General Delivery to inquire whether there is perchance any mail from Madrid. The Rumanian potentates, male and female, are going through the last phases of domestic indecency and royal exhibitionism before their final westward voyage on board the Bucharest-Vienna express.

Hapsburg Grand Dukes appear in lower East Side police courts to tell inquisitive shysters what they have done with certain ancestral heirlooms which were not theirs to sell or pawn. A little bald-headed man living on a penny's worth of rice a day and garbed in a solitary cloak of his own weaving telephones His Majesty's most august representative and suggests that the latter drop in sometime and see him to "discuss matters of grave importance and prevent another outbreak of violence." Reputations that seemed as tight and as solid as the shining porphyry slab that covers the mortal remains of the defunct Corsican are rapidly being carted away to the dump heap of defunct statuary hidden somewhere in a forgotten nook of the great Versailles mausoleum.

Manners, morals, and customs which seemed possessed of the granite strength of the ancient Mosaic tenets have become mere questionable expressions of doubtful religious prejudices. The patient Mexican peon is burning down churches. The navy of yesterday is the prime minister of today, and Paris cafes, which for more than a century have catered to the exile-trade from half a dozen European empires, have had to be converted into American bars, lest they tumble into the hands of the commissioners of bankruptcy.

The difference between the year 1914 and the year 1931 is much greater than the difference between 1931 and the ever memorable day of Constantine's pious, though practical, conversion to the faith of the Nazarene prophet. And yet, old Ulrich was right. "It is a joy to be alive today, for everywhere the spirit of man is awakening."

Oswald Spengler would hardly agree with all this. He spent ten years sitting uncomfortably in a badly lighted and

badly ventilated little room where with shivering fingers he predicted the imminent downfall of Western civilization. That book, to my way of thinking, is the finest piece of work that has come out of a European inkstand these last hundred years. But I flatly disagree with its general conclusions and with the stark despair that radiates in such brilliant confusion from every page. Perhaps I see things a little too simply. The habit of reducing every problem of life to a convenient little picture may have something to do with this. Spinoza and Montaigne and even long-nosed Erasmus may desert me during these troublesome times. But as a humble pupil of Wilhelm Busch, I can never become an open and avowed pessimist. And all the terrible headlines of all the front pages of all the newspapers in the world won't be able to convince me that this is not by far the most marvelous and interesting period of history through which mankind has ever passed on its queer peregrination through space and eternity.

We all live by fairy stories. The only successful statesmen and the only successful founders of new religions are those who have recognized this fact. The Truth for which the late Saul of Tarsus searched so diligently that he upset a whole empire in doing so does not exist. Momentary approximations of the truth have been duly registered by the keepers of our historical seismographic stations. But the fairy story and not the truth shall set us free.

Every one of us has his own fairy story. And I have mine. It bids me believe that nothing is ever wasted in this universe of ours, that nothing is ever lost, that nothing can ever be lost. As it was in the beginning, so it is now and ever shall be!

The sum total of energy with which we started out shall be returned intact on the Day of Judgment (if any). That energy, however, assumes queer forms and shapes and manifests itself in such absurd physical shapes as my beloved dog Noodle (Lord bless him, and how he hates this treeless city, but then there is the Empire State Building!) and the giraffe of Mr. Barnum's menagerie. It manifests itself in the philosophy of life of Herbert Hoover and of Albert Einstein. It appears one day in the guise of a Romanov hanging party, and the next one it is garbed in the dreary brown of a Stalin shooting squad. But it is ever present. It is ever active. It is self-sustaining. Not an iota or atom or electron can be added to it or subtracted.

To say that civilization is hell-bent for perdition is sheer nonsense. Civilization is merrily galloping toward a great and profound change and that is all. No vital civilization ever came to an end. It continued in some other form.

Wherever I go these days I find glum faces and hear people loudly bewailing the "crisis."

There is no crisis.

There is merely a revolution.

A revolution which lives faithfully up to its original definition: "a fundamental reconstruction of the whole fabric of society."

Ten years ago the Daughters of the American Revolution would have sicked the police on us for such a statement. Today the dear ladies must listen to these same words emanating from the sacred lips of the Great White Father of F Street, Washington, D. C.

Galileo Galilei observed that "the world do move." I hereby offer an amendment to that famous saying. The world not only moves. It moves darned fast.

Russia's Race Against Time

By LOUIS FISCHER

Moscow, July 19

THE final sowing figures for the entire Soviet Union are now available. The total area planted this spring amounts to 97,032,300 hectares, which is 9.9 per cent more than the area planted in the same period last year. About one-fourth of the whole, or 25,454,900 hectares, has been devoted to wheat. It is especially significant that 88 per cent of this wheat acreage belong to the collective and state farms, a circumstance that insures quicker and better harvesting, lower costs, and direct sale to the government for city-feeding and export purposes.

Sowing increases over 1930 equal 7.3 per cent in wheat, 35 per cent in flax, 30.7 per cent in sugar beets, 32.5 per cent in sunflower seeds (used here for their oil), 22.8 per cent in hemp, 76.7 per cent in vegetables, and, last because not least, 50.5 per cent in cotton. For a number of years the Soviet Union purchased approximately \$50,000,000 worth of cotton annually in the United States. Two years ago Russian cotton imports began to fall until now the Bolsheviks are altogether independent of outside supplies except for small quantities of special Egyptian and Persian staples. In fact, the U. S. S. R. recently exported limited quantities of cotton to England. The Soviet Government,

to be sure, would refrain from exporting cotton if it considered only the expanded and unsatisfied textile requirements of the country. It would perhaps even import some. But Moscow possesses so little foreign currency and has obtained so few foreign credits that it is forced to deprive the domestic market of indispensable commodities in order to obtain the valuta for acquiring foreign machinery.

Since its inception the Soviet Government has received very limited credits in Western countries at extremely high interest rates, not less, though it sounds fantastic, than 25 per cent, on the average, above the normal rates. This difficulty partially explains the rapid pace at which the Bolsheviks are industrializing the country and raising its agrarian productivity. To depend on foreign nations is so expensive and uncertain that the Communists see themselves compelled to attain economic self-sufficiency at the earliest possible moment. Every step toward freedom from foreign sources of supply is therefore heralded by the press as a "Socialist victory." The papers note at least one every day. Now it is iodine which the U. S. S. R. need no longer import, now 50,000-horse-power turbines, now some agricultural implement, now cotton-ginning equipment. These achievements cause privations because they require added

exertion, but they hasten the process of national industrialization and modernization.

The great stimulus toward Soviet mechanization, however, is not the shortage of credits but the shortage of labor. This is today the supreme concern of bolshevism. The man power available at present is simply insufficient for the construction tasks which the government has undertaken. In most countries the obvious solution would be a reduction in the number of tasks. Not so with the Communists. They do exactly the reverse.

The situation in the coal industry is the most recent illustration. The Donetz Basin in South Russia, where most of the U. S. S. R.'s coal is produced, is working badly, officials complain. It exceeded last year's output but did not fulfil the program fixed by the Five-Year Plan. This failure is due, in the main, to the fluidity of labor and labor's lack of skill. Steps are of course being taken to remove these faults, but the Bolsheviks go to the root of the problem and seek its solution in the complete mechanization of the coal industry of the entire country. Accordingly, a decree issued on July 7 by Prime Minister Molotov for the government, Stalin as secretary of the Communist Party, and Sergo Ordjonikidze, chairman of the Supreme Economic Council, instructs the Coal Trust "to mechanize 50 per cent of the bigger mines by 1932 and to carry out complete mechanization by 1933." In two years, therefore, Russia will stand far ahead of America, Germany, and England in the mechanization of mines. The last shall be first, in this case, because it is last. Russia's present backwardness, in other words, is the best guaranty of rapid advance. The Bolsheviks believe that it would be more difficult to train enough men to mine coal cheaply by the old pick-and-shovel and pony method than to introduce machinery and teach fewer hands to operate it. The scarcity and inefficiency of labor force the Bolsheviks to adopt radical cures which not only make trying work easier but accelerate production. Russia enjoys the advantage of having undertaken industrialization in an era when the tools therefor are available in other countries. But whereas those countries would have to destroy property and overcome considerable inertia and more conservatism in order to apply the newest methods and equipment, the Soviets in many instances either build on virgin soil or discard things too obsolete to preserve. Moreover, no economic traditions exist here.

The mechanization of the Donetz Basin will ultimately raise coal production and thus in turn form the basis of further industrialization in other fields. The process is endless and grows like a rolling snowball. Observers have prophesied, ever since large-scale industrialization started in 1927, that the Bolsheviks had bitten off more than they could swallow and would soon suffer the consequences. Some even predicted the total collapse of the system. But a few of us who have been here for years realized that although the pace of industrialization seemed rapid in 1927, it would be much more rapid in 1928, and that a speed judged to be insane in 1929 would be regarded as slow in 1930.

Many students of Soviet affairs err in interpreting the rapid tempo of Russian industrialization. Asked to explain why the Bolsheviks should make the population submit to sacrifices in order to industrialize quickly when they can do it more slowly with less discomfort, their easiest answer is the fear of foreign attack. Russia, they say, must become

economically self-sufficient at the earliest possible moment so as to be in a position to repel invasion. The prospect of a repetition of the foreign military intervention of 1918-20 is indeed a constant nightmare to the Russian people. They will work harder if they are told that the development of their country strengthens its defenses, as of course it does. Because this motive has a popular appeal, the Communists frequently employ it to explain the fast pace of construction activities. And because it is simple, many foreigners grasp it and go no farther. But while the defense element is a factor in the situation, its role is relatively small. The real explanations must be sought in the realm of economics.

The secret of the terrific speed at which Soviet industrialization is proceeding lies, in the first place, in Russia's demand for a higher standard of living. The wish to enjoy a greater measure of comfort and happiness was stimulated by the war. Furthermore, the liberation of the downtrodden classes from domination by the Russian aristocracy and plutocracy taught the poor a new self-respect which immediately translated itself into insistence on better education and better living conditions. The Bolsheviks encouraged these tendencies. It was inconceivable that the proletariat and peasantry should not obtain material benefits from the revolution which made them the rulers of the country and expelled their former masters. The absence of such gains would have constituted a denial of the revolution. But the improvement could only be effected by giving the people more goods, more houses, more entertainment. This required the building of factories and a rise in agrarian production. The peasants had to grow more in order to buy more, and new factories were needed to satisfy the swollen demand for commodities. If at this stage—in 1923 and 1924—the capitalist world had helped Russia with credits and loans, Moscow would have placed less stress on self-sufficiency and bought considerable goods abroad, a procedure which would naturally have retarded domestic industrialization. Looking back, the Bolsheviks now regard the capitalist financial boycott as a blessing in disguise. They are much farther today as a result of it.

Quick-time industrialization, moreover, was necessary to create employment for the vast amount of surplus labor in the villages. For more than a century Russia has witnessed a constant flow of peasants from the rural districts to the cities. Although the Bolsheviks gave land to the peasantry and guaranteed it against debts, mortgages, and the pressure of usurers, the Soviet system nevertheless obstructed the enrichment of the farmer as an individual and thereby created a still greater exodus to urban centers where the mujik expected better pay and easier work. To satisfy the demand of the newcomers for jobs required industrial development on a grandiose scale.

In 1927, before the Five-Year Plan began, the Communists discovered that their policy vis-a-vis the villages had reduced agrarian production to such an extent as to compel the government to put the city population on rations. For a variety of reasons, and after many bitter conflicts in the party, the Bolsheviks decided that the only solution of their friction with the peasants was the socialization of agriculture: concretely, the establishment of collective and state farms. But while collectivization is theoretically possible and beneficial without machinery, in practice, tractors, grain elevators, and modern equipment not only hastened

the process of collectivization but increased the output of collectives once they were organized. The beginnings of industrialization which preceded collectivization enabled the Bolsheviks to initiate socialism in the villages without fear of letting the new collectives go entirely machine-hungry. And as soon as collectivization began to sweep the country, the present wildfire tempo of industrialization started. The collectives clamor for mechanical equipment and for consumption goods, and the Bolsheviks must at least try to satisfy this demand partially, since without collectivization the government faces the alternative of reverting to capitalism or of starving the cities and dropping out of the grain-exporting column.

Today, after only two harvests, the collectives are giving the government grain for export—which opens possibilities of bigger purchases of foreign machinery and consequently of speedier industrialization. The collectives, likewise, are yielding larger industrial crops, such as cotton, flax, hemp, and sugar beets—which enables factories previously deprived of raw materials to raise their production.

Thus, the early stages of industrialization between 1927 and 1929 made collectivization possible. Now collectivization, in its turn, makes further industrialization possible. Further industrialization should mean richer crops, and these again should mean more industrialization. Soviet industrialization never was a mere Bolshevik whim. It was a national necessity. At present it has ceased to be only a policy. The Communists are being driven by the forces they have released. They cannot stop and do not wish to. All signs indicate that the pace of Russia's industrialization will become fiercer in the next few years, unless the physical and nervous strain becomes intolerable.

I repeat, the great Bolshevik problem today is the labor supply. The flow of labor from the villages to the cities has been sharply reduced by collectivization. Moreover, the peasant prefers to stay at home and escape the sacrifices accepted by the urban worker to help along the Five-Year Plan. One would think that since the exodus of extra farmhands from the villages created an impulse toward industrialization, the drying-up of that flow would moderate industrialization. But this would be "wooden logic." Actually, the very opposite happens. For instead of slackening construction, the answer to the peasants' refusal to seek employment in cities is further mechanization of industry, and mechanization and intensification on the land so as to accomplish the same amount of work with fewer workingmen. But mechanization and intensification are of course synonyms for industrialization.

Obviously, however, the system cannot get along without men, and the shortage of labor as well as its causes are a serious concern to the Soviet Government. Stalin dealt with the problem in his recent speech to Russian industrialists, and phases of the question occupy a vast amount of space in the newspapers. "You will find few plants," Stalin said, "where 30 to 40 per cent of the workers do not quit during half a year or even a quarter." In a speech a few weeks ago, Quibishev, a member of the Politburo, declared that the number of miners in the Donetz Basin with only from one to two years' experience had risen in recent years from 5 to 40 per cent. In the Lubertsi Agricultural Machine Factory outside of Moscow 5,335 workers were taken on in the first six months of 1931 while 3,974 left their jobs.

In June alone 1,589 men accepted employment in the same plant and 914 went away. This, of course, does not resemble "forced labor." Labor that is "serf" or "slave" would be tied to its place of employment, whereas these and other figures, and Stalin's and Quibishev's complaints, plainly indicate that the "fluidity" or casualness of labor has assumed alarming proportions. Radical reforms are necessary. "We must not tolerate the fluidity of labor in industry any longer," Stalin states. "To get rid of it we must pay wages on a new basis and make the working staff of a plant more or less permanent." How? The concrete measures suggested by him and others include compensation on piece-work principles throughout industry, improvement of the political and economic status of engineers and mechanics and the freeing of them from unwarranted suspicions which have in the past paralyzed their initiative, enthusiasm, and usefulness,* and changes in the system of management which would make one man directly and individually responsible for the operation of a smaller production unit.

These innovations reach deeper than the uninitiated may suppose at first glance. It is expected that the same steps will attract more peasants and members of collectives to the city jobs previously shunned by them because of the low wages and poor housing conditions they offered.

According to the papers, the benefits of the recent reforms are already in evidence. The productivity of men and plants is rising, they say. But the problem will not be solved, in my opinion, until two things happen. First, an engineer's or director's mistake must not involve his arrest by the G. P. U. Errors are universal and need not be malicious. There are wreckers and saboteurs in Soviet industry; foreign specialists testify to this fact. But their number is small compared to that of the loyal engineers who have a right to expect the government's trust, and who will work better when the fear of administrative punishment is removed. Terror was never a means of managing factories.

In the second place, the proletariat's demand for more consumption goods and better homes must be satisfied. The peasant will not leave his village to earn paper rubles which he cannot spend because the stores are empty. And with literally hundreds of thousands of jobs going begging, the worker will move from one spot to the other until he lands a place that offers him a good cooperative apartment and a shop well stocked with food, clothing, tobacco, and, for many of them, vodka. The government knows this as well as I do. It would be unfair to imply that efforts are not being made to give the workers better living conditions. Under the guidance of Kaganovich, a member of the Politburo, Moscow is being rebuilt. Socialist cities are going up in Stalingrad, Nijni-Novgorod, Novorossisk, Magnitogorsk, Kuznestroi, and elsewhere. Postishev, an important secretary of the Communist party, censured Bolsheviks at Archangel the other day for their "insufficient attention to the cultural and material requirements of the longshoremen." Moscow is alive to the situation. But before labor scarcity and fluidity disappear much more remains to be done in the matter of raising *real* wages. Agitation and proper organization can contribute toward higher individual productivity. The final solution awaits the liquidation of the food and goods shortages.

* See Mr. Fischer's article *Servants of the Soviet* in *The Nation* of November 26, 1930.—EDITOR THE NATION.

One word of caution. Stalin's advocacy of piece work, of the division of mammoth trusts into more manageable units, of personal instead of collective responsibility by factory directors, and his obeisance to the bourgeois specialist will be interpreted abroad as a move toward capitalism. The employment of capitalist methods of production is as little proof of a tendency toward capitalism as the use of the capitalist automobile or capitalist engineers by the Soviet state. Ownership, purpose, and control determine the character of the Russian economic system. There can be no return to private capitalism in a country where there are no private

capitalists in the cities and where the rural small holder is fast being submerged by collectivization. And the fast-growing proletariat is the best guaranty against private ownership. It was to create a larger proletariat which would counterbalance the capitalist elements in the cities and villages that the Bolsheviks advocated industrialization from the very beginning of their regime. Industrialization is the historic function of bolshevism—essentially a westernizing movement. And when once industrialization began, economic possibilities and political motives drove the speed up to the present high rate.

Are Militarists Feeble-Minded?*

By EDWARD ALSWORTH ROSS

THE Western peoples are in a strange phase. The most civilized nations are more fearful of one another than ever before, and each of the great peoples regards every other great people as more treacherous and cruel than Apache Indians. The peoples of non-Christian Asia are by no means so mistrustful of one another as the Christian peoples of Europe. To judge by their actions, you would conclude that no people attaches the slightest importance to the fact that its neighbor or rival is civilized, educated, and Christian. At a time when the regional tensions within nations like France, Great Britain, Germany, and Italy are weaker than ever before, when highways, railroads, schools, newspapers, and radio have made each of them one people as never before and the shadow of civil war seems to have passed away forever, each nation goes in fear of other nations and suspects them of the most monstrous designs.

About this strange international situation there are several significant features:

1. The little peoples enjoy more sense of security than the great peoples. If the motives and intentions of the Powers were really as unscrupulous and ruthless as many picture them, how could Swedes, Norwegians, Swiss, Belgians, Dutch, Portuguese, Greeks, or Czechs enjoy a night's rest? There is nothing to restrain one of their powerful neighbors from sending its air fleet and blotting out their chief cities over night. You would suppose that the citizens of these small and weak states would live in constant terror. As a matter of fact they seem to go about their business with a serene mind.

2. There is an immense amount of touring and travel among the great peoples, and as these tourists go about they discover no fundamental repugnance, no natural hostility between themselves and the people they travel among. The German travelers are not shocked to discover what manner of folk the English, French, and Americans are. Nor do Americans going about in Japan find any reason to attribute to the Japanese sly and sinister intentions. In other words, the causes of mutual antipathy and suspicion are not in the peoples but in their respective governments. It is the governments that set their peoples against one another and not the peoples that set their governments against one another.

3. It is easy to understand such inveterate hatreds as

one finds between roaming tribes and settled peoples, between predatory groups and the industrious peoples they prey on, between piratical folk and trading peoples, between cannibal tribes and their victims, between civilized peoples and slave-raiders, between free peoples and slave-holders. But between the mutually fearful peoples of today there is no ground whatever for reciprocal hatred and hostility. Does anyone pretend, now that the cloud of false war propaganda has lifted, that there is any such difference in the planes of civilization in the belligerent countries as should make them wish to destroy each other by every means within their power?

4. In original nature the Christian religion is one of the gentlest and most humane religions the world has ever seen—far more so than Islam, for example; yet it is precisely the Christian nations which most fear one another and arm against one another. In Asia neighbors may have common boundaries for centuries, yet never arrive at a dispute which brings on wholesale bloodshed.

Such facts lead one to the conclusion that the roots of the mutual international suspicion which begets militant attitudes, armament rivalry, and war-breeding gestures are not in peoples at all or in cultures, but in governments. They are not in the governments of small, non-imperial peoples like the Swiss, Danes, and Norwegians, but in the governments of what are called the "Powers." What distinguishes these governments is readiness to use force outside their boundaries in order to bring under control backward peoples, particularly those which have within their territory valuable natural resources or mineral deposits. It is *imperialism* then, which is the chief troubler and vexer of the friendly relations which should normally prevail among the great peoples of Western civilization.

It is an error to suppose that the clutching policies of governments are really held in check by their people. In the conduct of foreign affairs the people may be brought to believe in or approve almost anything which the government or the dominant class wishes them to believe or approve. Scrutiny of the record of our Department of State shows it to be swayed by about the same influences as sway the corresponding departments of other governments, that is, its attitudes abroad reflect the wishes of the element interested in the export trade, of groups which have gained concessions to valuable things in weaker countries, of capitalists who

* An address given before the World Federation of Educational Associations at Denver, July 28, 1931.—EDITOR THE NATION.

have put money into properties or securities in countries not in a position to defy us. All the profit resulting from foreign trade, or investments, or concessions accrues to small groups of citizens, but all the cost of protecting them, of coercing independent nations, as well as the risk of war with other imperialistic Powers likewise alert in asserting and furthering the interests of similar groups of their own citizens, is borne by the entire body of people. It is a "heads I win, tails you lose" proposition. In no governmental sphere are the resources, even the lives, of the home-staying citizens so shamelessly and cynically risked or sacrificed as in the secret subserviency of foreign policy to the desires of little groups of great capitalists looking for easy money outside their homeland. If people who do not wish to be led like sheep into the shambles of modern warfare do not cease to put their trust in the wisdom, foresight, and purity of motive of their respective governments, they are doomed.

You will be told that the above goes for Japan and Great Britain and Germany and Soviet Russia, for every powerful government on earth, in fact, save only that of the United States. However, the pretense that this government has always played the role of a little innocent lamb can be maintained only with difficulty. To quote Professor Sloane, formerly president of the American Historical Association:

Our own history since independence is an unbroken record of expansion and imperialism. Our contiguous territories have been acquired by compulsion, whether of war, or purchase, or occupation, or exchange. We have taken advantage of others' dire necessity in the case of Great Britain, France, Spain, Russia, and Mexico. To rectify our frontier we compelled the Gadsden purchase within the writer's lifetime. As to our non-contiguous possessions, we hold them by the right of conquest or revolution, saving our consciences with such cash indemnity as we ourselves have chosen to pay. . . . In no single instance of virtual annexation or protectorate have we consulted by popular vote either the desires of those inhabiting the respective territories annexed or the Hague Tribunal. In every case we have had one single plea and one only—self-interest.

A former chairman of the House Committee on Naval Affairs has pointed out that ". . . either our army or navy or both of them have been employed in forty-eight wars and warlike operations during seventy-nine years of the period from 1775-1927." The American government has landed troops on foreign soil on more than a hundred occasions during the last 115 years.

Out of the feelings fomented between the great peoples by governments and by certain financial groups has grown that monstrosity we may call "the military mind." This type of mind insists that:

1. *War is inevitable.* In 1928 Assistant Secretary of War Robbins said to the West Point graduating class: "Unhappily, in 10,000 years of recorded history we have made but small advance toward universal peace. It is something to be hoped for and prayed for but not something to be expected for many generations to come." Well, if warfare increases in deadliness and destructiveness at the rate the military experts expect, we shall not have "many generations" to make up our minds about it. The next world war is likely to overwhelm the participants in one common ruin.

The head of the American Legion declares, "None of us wants war. As far as that goes none of us wants hurricanes"—implying that human wills have no more to do with the outbreak of wars than they have to do with the genesis of hurricanes!

2. *War is beneficial.* Dean Theodore J. Hoover of Stanford University, brother of President Hoover, insists: "The human race develops by war and succeeds in war in proportion to its use of metal. Races perish in peace. Culture is increased by the invention of new weapons. The pacifist errs in assuming that peace is desirable." If he believes this he ought to favor junking our Supreme Court and letting Illinois and Missouri fight out the issue of the polluting of the waters of the Mississippi by turning the sewage of Chicago into its tributary the Illinois River! What a pity, too, that Colorado and Kansas were not permitted to come to blows over the dispute as to the diversion of too much of the water of the Arkansas River to irrigate the fields of citizens of Colorado! For "the human race develops by war," Dean Hoover says, and of course we all want to "develop."

"The fact becomes plain," says Rear Admiral Fiske, retired, "to anyone who will consult the records that without the stimulus given by wars, the sciences and the arts and engineering, medicine, and surgery would hardly have been even started." Then we ought to welcome earthquakes, mine explosions, bridge collapses, Johnstown floods, and like catastrophes which put engineers, doctors, and surgeons on their mettle. If not enough of them happen of themselves, let us provide disasters artificially. What a pity that the digging of the Panama Canal, the building of Boulder Dam, Mississippi flood control, the harnessing of rivers to create electrical energy, the erection of skyscrapers, the building of ocean liners do not provide sufficient stimulus for "the sciences and the arts and engineering"!

3. *Preparedness to fight is the best guaranty of peace.* "The way to secure peace," says the Briton Winston Churchill, "is to be so much stronger than your enemy that he will not dare attack you." Now if this prescription is good for England, it should be good for England's neighbors; but if they should all follow it, they would be engaged in the impossible enterprise of each trying to make itself stronger than any of the others. One of our generals said to a New York audience: "If we had now or could get together . . . more tanks, airplanes, and munitions than any other country, and faster than any other country, we could lay our cards on the table and say, 'There is our hand, can you beat it?' and there would be no war." What does the gallant officer suppose other countries would be doing as they watched us assembling in frantic haste more lethal machinery than any of them had?

The militarist takes great credit to himself for never asking one penny for offense; he is only pleading that his country "put itself in a posture of defense." And who but a Communist or a "traitor in the pay of Moscow" can object to his country being prepared to protect itself if wantonly attacked? However, in the demands militarists all over the world are making upon their respective governments, every man, every gun is for "defense," not one for aggression! But if all the armies and fleets are for defense, against whom are we arming? In each particular case the shouters for stronger defense assume that the military heads

of other nations are lying when they profess to be concerned only with national defense. But if we suspect them of lying, why shouldn't they equally suspect us of lying?

The militarist considers universal compulsory training of our young men in time of peace "the most important lesson of the war." Now a few years of universal military training would give us ten million soldiers. What defensive need have we for such myriads? If a nation so unget-at-able by land as ours shows itself apprehensive, what nation would dare reckon its need of soldiers less than that of the United States? So we should be leading the way to world-wide militarization in all nations, and for so doing should earn the hate Germany drew upon herself by incessantly "forcing the pace" of military and naval preparedness. So head-feeble are the militarists that never yet have I met with one who had given the slightest thought to the effect of our adoption of compulsory military training upon the "preparedness" policies of the rest of the world.

In the Driftway

DESPITE an interest in the modern girl, superheterodyne radio sets, and the quantum theory, the Drifter still delights in simple things. That is why he shares not at all the snobbery of many sophisticates toward those droves of blissful idiots who enrich the owners of our various Coney Islands. He has always, for that matter, flattered himself upon his ability to derive enjoyment without inquiring too minutely into its cosmic significance.

* * * * *

IT takes a little too much, however, to give the simplest American a thrill. If you really want to taste the fruits of simple pleasure, you must take yourself to some such land as France, and once there flee from Paris to the provinces. The Drifter, one day in Gascony, plunged head-long into the joys of a country fair. In a hamlet which donated even its sidewalks to the parking needs of mysterious auto trucks, every square, including the inevitable Place de la République, offered entertainment in a rich diversity. From miles around people had flocked to this magnetic area, coming in noisy little cars, high two-wheeled peasant carts, or, many of them, in diminutive wagons drawn by dusty little donkeys. Indeed, one of the chief satisfactions of this festival, it appeared, was the chance it gave to compare modes of locomotion; for invariably before returning homeward each family strolled back and forth in all the side alleys, chatting pleasantly, and not without occasional witticisms, about the dilapidated cushions of this pocket auto or the bright paint of that fine cart belonging—to M'sieur Belotier of Roc Rouge, did you say?

* * * * *

ALL the French are children. The young ones are the best-dressed children in the world, though of the old, at least in rural Gascony, nothing should be said on that score. But they all know how to have a happy time. The balloons that burst in a single day make you wonder what would happen to the rubber industry were it not for these French fairs. But balloons are reserved for the younger

set, while the older boys and girls are charmed by the multitudinous slot-machines. And for those who approach, even here, the edge of urban sophistication, there is the "Statue de Liberté Fortune-Teller," the "Américain Luna Parck Hop La!" (these typographical errors are not the Drifter's), and the row of look-for-a-sou miniature cinemas revealing the secrets of "les Bandits de Chicago" along with the adventures of "les Mademoiselles d'Hollywood." Yet for those who crave more practical tilts with life, there are the vendors of cloth, watering pots, neckties, onions, jackplanes, harness, magic china cement, shoestrings, native pottery, sweet buns, cider, potted plants, bérêts Basques, peanuts, donkey-packs, baskets *du pays*, and an infinite choice of candies that melt in the mouth—if they have not already melted before reaching it.

* * * * *

IF he had wanted to, the Drifter could have ridden on the *chevaux-de-bois*, selecting either Fendlair, Coco, Mignon, or Jim for steed, to the tune of Dvorak's "Humoresque" or Fanny Brice's favorite, "My Man." But this opportunity of a lifetime he blithely passed up, together with the "Majestic Lottery," "Boule Chinoise," the great speculating wheel "Au Grand Jeu de Bohème—Adieu, Ma Belle Marchandise!" and even "le Thermomètre d'Amour." What captivated the Drifter was the "Luges Sport," a contraption devised with devilish ingenuity, by which, on sleds going over a bumpy track and stopping gently (as a rule) on upgrade, you might speed down a declivity all of thirty feet for the ridiculous fee of ten centimes, two-fifths of a cent, per ride. It isn't every day that one lets go his *amour propre* to be a child in Gascony.

THE DRIFTER

Correspondence

The Caustic Menorah

TO THE EDITOR OF THE NATION:

SIR: An editorial paragraph in your issue dated July 29 speaks of "the cynical *Menorah Journal*." That is a strange adjective to apply to a publication noted for sincerity and seriousness in its discussion of Jewish and general questions. At any rate it was not the *Menorah Journal* speaking editorially that made the remark you quote. The quotation is from a columnist in the *Journal*, who writes his personal views under the nom de plume of "An Elder of Zion." And in fairness to the Elder it should be noted that your quotation omits (without indicating that there is any omission) a most important qualifying clause, which I put in italics in the following corrected sentence: "Now, *if we are to believe the recently adopted new Z. O. A. [Zionist Organization of America] program*, a Zionist is a man who invests his money in Palestine and runs home to West End Avenue to wait for his eight-percents to start rolling in."

I imagine the Elder—the old fellow is far from a cynic, however mordant his pen—had in mind something of what your paragrapher well goes on to suggest, namely, the need of facing the whole issue of Zionism once more—of facing it with most thoroughgoing thought and plain talk, without regard for political Zionist organizations and American corporations aiming to develop Jewish interests in Palestine through private investments. Deeper than that, indeed, is the question with which

your paragrapher concludes, though Zionism is of course bound up with it: "What is Judaism?"

In every issue of the *Menorah Journal* these matters are discussed—often caustically, but not cynically.

New York, July 27

HENRY HURWITZ,
Editor the *Menorah Journal*

[We are glad to substitute the adjective "caustic" for "cynical" as applied to the *Menorah*, though we meant no insult by the latter term, the word cynical being sometimes equivalent to "intelligent." The responsibility of a magazine for an anonymous column, appearing as a monthly feature and written by one of the editors whose name appears on the masthead of the journal, is a nice question in editorial ethics. For the typographical omission we apologize. In any case we must express our belief once more that the caustic comment of the editor of the *Menorah Journal* and his Elder in Zion are among the most realistic and stimulating discussions of Zionist problems we have met—sometimes we should even call them intelligently cynical.—EDITOR THE NATION.]

A Successful Conference

TO THE EDITOR OF THE NATION:

SIR: I like to read *The Nation*, I like to write for it, I like to agree with it (when I can) and still more to disagree with it when it grumblingly misinterprets public events. *The Nation* has described the London conference as a failure. This was a slight error. The London conference was a great success and bridged one of the most dangerous chasms which the world has ever faced.

Germany, the embarrassed debtor, had steadily become more and more hard up. Whether because of excessive reparations or for other reasons, the acuteness of her plight had become so plain to the world that Mr. Hoover had been able to persuade the difficult Republican and more difficult Democratic leaders of Congress that Germany must be given a respite, and had thereupon forced through the one-year moratorium on reparations. But the delay of Paris had seriously weakened the effect of this act, lately hailed by *The Nation* as "Mr. Hoover's great action." Hence the panicky flight from the mark began.

Has not *The Nation* an ounce of credit to give Mr. Hoover for foreseeing that such a storm might break? Why otherwise were Messrs. Stimson and Mellon in Europe at just the critical moment? Prior to the London conference there had been talk of a \$500,000,000 long-time loan, but France had declared that she would participate therein only if she got "political appeasements," which meant such demands on Germany as her leaders dared not grant even if they were willing to do so. Therefore a long-time loan was impossible, since it could not be obtained if France declined to participate. Mr. Hoover's problem was not only to write a prescription which would not require the approval of the Senate, but one which France, as well as the other European nations, would have to swallow—and with apparent enthusiasm—whether they liked it or not. This meant that he was obliged to make a proposal so moderate, so fair, so simple that the world could comprehend it, that no one could dare to refuse to accept it.

Instead of proposing a new loan—which could not have been obtained—he asked only that the governments join in requesting holders of the billion and a quarter dollars' worth of short-time German maturities to extend forbearance until a far-reaching, constructive plan could be worked out by the Bank for International Settlements. Here was a request so moderate that neither decent men nor decent governments could

—the eyes of the world being on them—refuse to grant it. Even a child could comprehend what Mr. Hoover proposed.

So it was that the seven-power conference asked the citizens and banks not only of their own countries but of the entire world not to press for collection of German claims. This was all they did. Was it, as you seem to claim, an empty gesture? By no means. They made a mere request; but the world's opinion being behind that request, it has had more than the force of law. Though not backed by armies or courts or sovereigns or senates (and that is one of its great merits), it justifies any steps Germany may take by moratorium or otherwise to prevent the continued flight from the mark and to compel extension of credits until panic may subside and a real and far-reaching plan is evolved. And this has been the effect of the conference.

Why, then, is *The Nation* disgruntled? Why does it call the London conference a failure? Did it want the London conference to get tangled in the barbed wire of politics while trying to work out a new loan? Did it want Hitlerism or communism in Germany? Does not *The Nation* realize how easy it would have been for that conference to have tabled the whole matter with nothing but the appointment of so-called experts to spend months in diagnosing the condition of the patient while the patient gasped for breath? Chancellor Brüning, far from returning to Berlin "empty-handed," as *The Nation* declares, went back to Germany enabled as a result of the London conference to take such measures that within less than two weeks thereafter the banks have reopened, and today (August 6) deposits are far exceeding withdrawals.

Hence the seven-power conference, by Mr. Hoover's appeal to the decencies of mankind, has definitely accomplished an immense result. While it may be an overstatement to claim that it has lifted the clouds which overhang this frightened world, the outcome of the London discussions, if followed up in a like spirit by the committee of the Bank of International Settlements, may well prove the most notable forward step toward real world peace and security achieved since Armistice Day.

New York, August 6

JAMES N. ROSENBERG

[We regret that the information in our possession and our interpretation of what has happened in Germany make it impossible for us to agree with Mr. Rosenberg.—EDITOR THE NATION.]

Miners Need Legal Aid

TO THE EDITOR OF THE NATION:

SIR: "Why Must the Miners Starve" is the story of the Pennsylvania-Ohio miners told by Mauritz A. Hallgren in *The Nation* of July 29, and it is, indeed, a moving one. After reading that article, can anyone wonder why the miners have been forced to go on strike? Some of the things mentioned by Mr. Hallgren on police terror dovetail into the findings of an investigating committee headed by Theodore Dreiser which has studied this mine field. Mr. Hallgren, for example, said:

[Strikers] are forced daily to face a silent reign of terror. . . . In the picket lines [they] must walk meekly and silently if they do not want the hickory club of a deputy sheriff brought down on their heads. (A goodly number of the notorious Coal and Iron Police have been lately rehired as deputy sheriffs in western Pennsylvania).

The Dreiser committee's report supplements this by showing that to date three miners have been killed, one while defending his wife from bullets on his own porch, and another who was only sixteen years old; that over 1,000 miners have been herded into jail; that efforts have been made to destroy

the strike by arresting the most active workers; that 35 miners have been severely wounded; that more than 2,000 men, women, and children have been gassed, clubbed, and ridden down by horses of the State police; and that over 3,000 families have had eviction notices served on them.

In defending these victimized miners the International Labor Defense has an enormous job on its hands. Funds are urgently needed. Send your contribution to Miners' Defense Fund, Room 430, 80 East Eleventh Street, New York City.

J. LOUIS ENGDAHL,

General Secretary International Labor Defense
New York, July 27

Challenge to *The Nation*

TO THE EDITOR OF THE NATION:

SIR: In an excellent editorial paragraph in your issue of July 29, you say: "And that we may consider ourselves fortunate then if we still have our capitalist social organizations unaltered?" My criticism is based on your evident lack of any defined goal in your social and economic theory. You seem to come to the point of consummation and then flop. In my opinion we may consider ourselves damned if after continued suffering we do find our capitalist social order unaltered. Many of us who did not agree with you in supporting the Democratic candidate for President held our peace even though we considered it a compromise. Attempts at patching up or "civilizing" our capitalist system to obtain a measure of success are as shortsighted as was support of Al Smith and doomed to as great a failure.

Surely we have evidence enough to convince the intelligent that our profit-seeking system is the cause of our social troubles. Also, we have evidence of the success of the Communist system in Russia, and of the inevitable conflict between these two systems. I wonder if, when the conflict between these two systems becomes more intense, you will give your support to those who are crying "beasts of Russia," "baby-killers," etc., or if you will define your principles as Romain Rolland has. There can be no compromise.

Minneapolis, July 30

J. W. BAKER

A Workers' Theater

TO THE EDITOR OF THE NATION:

SIR: Several dramatic groups in New York City—namely, the Young Circle League of the Workmen's Circle, the Young People's Socialist League, the Rand School, various groups of the Socialist Party and the labor unions, several Negro dramatic groups of Harlem, Brookwood Labor College—have banded together to form the Workers' Theater in order to carry out a twofold purpose. The first is to reach a working-class audience that is unapproachable by the commercial theater; and to impart to that audience a definite message of a class-conscious social ideal. The second is to produce plays with the aid of those young men and women who as amateurs are anxious to express their social philosophy in a true dramatic form.

With these objects we are in need of all sorts and types of labor plays. Will those people who possess or who know of such plays please communicate with me at 7 East Fifteenth Street, New York.

We should also like to hear from other labor dramatic groups throughout the country.

New York, July 25

SAMUEL ROTHENBERG

Criticism and Facts

TO THE EDITOR OF THE NATION:

SIR: *The Nation* comes to our library regularly. I appreciate your courtesy in sending me a marked copy of the issue of June 24 containing the editorial paragraph on the granting of master's degrees by the College of Puget Sound. I do not know where you got your information, but I judge it came from the press.

Since you have offered your criticism, possibly you would appreciate having the facts. The two subjects you mention were offered, but both of them were rejected by our committee on graduate work. The two candidates were required to re-write their theses. One was able to do so before commencement and received his degree. The other will need to take another year. By this you will notice that the College of Puget Sound is not so worthy of blame as your paragraph implied.

EDWARD H. TODD,

President College of Puget Sound

Tacoma, Washington, July 28

The Polish Corridor

TO THE EDITOR OF THE NATION:

SIR: Permit me to draw the attention of your readers to one of the most serious sins of omission in the calculations concerning the financial adjustment of Germany. Even if President Hoover's generous and wise plan had not suffered from French sabotage, it would merely have postponed the catastrophe for another year, unless the principal causes of the German and general European plight were removed. One of these causes, if not the most decisive one, is the Polish Corridor involving the division of Upper Silesia. Ever since Germany's impossible eastern frontier was devised by an Allied commission under control of the French General Staff, experts have been pointing out the fact that the Corridor, with all its political, economic, and financial implications, will not allow Germany to recover, or Germany and Poland ever to live in peace. No amount of credit to the Reich's treasury will be able to fill the open gap on her eastern frontier. The Corridor problem must be settled before the economists and financiers can expect Germany to pay her debts.

Seefeld, Tyrol, July 19

OTTO E. LESSING

William Vaughn Moody

TO THE EDITOR OF THE NATION:

SIR: I have been told that there are many letters in existence, not yet published, written by the poet-dramatist William Vaughn Moody—my brother—whose untimely death in 1910 was considered a distinct calamity in the field of American letters.

I greatly desire to trace these letters for possible use in one or the other of two books on my brother's life ("Early Years" and "Later Years") now in hand. If original letters are sent, I will copy and return them promptly by registered mail. I shall also be very grateful for copies of letters, and for reminiscences or any data that may add color and interest to my books.

Song

By EVAN SHIPMAN

Water, do you reach to the stars?
Death, do you reach to the stars?
Singing water soon will I know
Whether the winds that with your current blow
Caress at length Death's bars.

For cause, O facile bars, let down.
Water where darker waters drown
Take me where the wind and little light
Shudder around this swooning death at night;
Not death, but as the star's light tortuously, down, down.

Mr. Huxley Settles Down

Music at Night, and Other Essays. By Aldous Huxley. New York: The Fountain Press. Edition limited to 842 copies, each copy signed by the author. \$10.

ALDOUS HUXLEY is Settling Down. He has sown his intellectual wild oats and has made up his mind to do something Constructive. So, at least, one is driven to conclude from his recent volumes of essays. True, he still has the reputation of being a blastingly cynical young man. One would think, judging by most of the references to him that still find their way into print, that his own point of view was that of the restless, standardless, rudderless, drinking, fornicating characters he seems so fond of depicting in his fiction. But if we assume that his attitude toward his characters was ever merely that of amused cynicism, it seems gradually to have become that of the moralist. He is less a twentieth-century Congreve than a twentieth-century Hogarth; his characters, in the light of his recent books, become just so many horrible examples, so many warnings. An attitude long implicit in his fiction, for example, and made explicit in previous essays, is expanded once more in the present volume in the essay called *Obstacle Race*. The thesis of this essay is simply that life loses its zest when the obstacles are removed, and that the cause of so much contemporary boredom is that the ancient hurdles, set up by the old conventions and taboos, have been rapidly disappearing. Science, he holds, must take the place of religion and superstition in this respect: "If the science is genuinely scientific, it will prescribe the setting up, here and there, of quite fantastic obstacles. . . . 'Here,' it will say, 'you must plant an irrational prohibition, here a preposterous taboo, here a whole series of frankly anti-biological impediments.'" Now one may agree entirely with Mr. Huxley on the need of obstacles, without thereby agreeing at all that such obstacles must be either artificial or irrational. In deploring the tedium that soon follows from "flat racing," Mr. Huxley, there is more than one reason for believing, is thinking mainly of the gradual disappearance, or at least the gradual lowering, of impediments in the realm of sex. But it seems to me that there are entirely rational arguments, and that it is therefore not necessary to set up anything but thoroughly rational obstacles, against, for example, sexual promiscuity. And I believe Mr. Huxley would think so too, if he merely took the trouble to make himself consistent. For one should not, as he does, at one moment indorse D. H. Lawrence's attitude toward sex, and then at another hold that it may be necessary once more for

us to consider the sexual act as intrinsically sinful if we want to restore our full enjoyment of it. Nor does this position seem consistent with the kind of confession of personal tastes that appears in the essay called *Squeak and Gibber*:

One of the stock arguments in favor of Platonic and Christian immortality is this: if there were no future life, or at any rate no belief in a future life, men would be justified in behaving like animals and, being justified, would all incontinently start taking the advice of Horace and the Preacher to do nothing but swill, guzzle, and copulate. Even a man of Dostoevski's intelligence oracularly affirms that "all things would be permitted" if there were no such thing as immortality. These moralists seem to forget that there are many human beings who simply don't want to pass their lives eating, drinking, and being merry, or, alternatively, like Russian heroes, raping, murdering, and morally torturing their friends. The deadly tedium of the Horatian and the nauseating unpleasantness of the Dostoevskian life would be quite enough, survival or no survival, to keep me at any rate (in these matters one can only speak for oneself) unswervingly in the narrow way of domestic duty and intellectual labor. For the narrow way commands an incomparably wider and, so far as I am concerned, an incomparably fairer prospect than the primrose path; fulfilled domestic duties are a source of happiness, and intellectual labor is rewarded by the most intense delights.

Such inconsistencies, it must be confessed, are comparatively rare in Mr. Huxley's work; perhaps most of those that make their appearance are the result of the fact that his own position has been gradually shifting; and when one's philosophy shifts like this, it has a way of doing so, not as a whole, but in fragments, with a good deal of backing and filling. Thus Mr. Huxley's present position seems curiously poised between the sheer derision of a Mencken and the almost entirely serious attitude of a Laski or a Lippmann; on any given subject he is likely to break out in either direction. Thus on his serious and "responsible" side he can deliver terrific blows at the cult of lowbrowism reflected in such writers as Hemingway, or at the "new romanticism" which worships collectivism and the machine; while he can still achieve his old cynical effects by juxtaposing, for example, physiology and mysticism: "Mme Guyon's ecstasies were most frequent and most spiritually significant in the fourth month of her pregnancies."

Mr. Huxley, in short, can still play with ideas, but the game takes on an increasing sobriety.

HENRY HAZLITT

The Enemy's Secret Code

The American Black Chamber. By Herbert O. Yardley. The Bobbs-Merrill Company. \$3.50.

MAJOR YARDLEY'S book is having an extraordinary and deserved success which can only be partly a *succès de scandale*. The fact that the truth of what he tells has been aspersed by high authorities at Washington certainly heightens the interest of his narrative, but on any grounds his book is one of the most entertaining of the many "now it can be told" volumes that have appeared off and on since 1919.

The government bureau of which he writes was a part of the Military Intelligence Division of the United States army. It came into being in 1917 and was discontinued in 1929 by Secretary of State Stimson, whose department financed the work after the war. Stimson's action was based on moral dis-

approval of the work done. Yardley and his assistants undertook to decipher all coded dispatches submitted to them, as well as any other documents or papers, together with papers suspected of carrying messages in secret inks, and the like. They also constructed codes and performed other related tasks. In this way they served the Department of State, the army, the navy, and the Department of Justice. Yardley seems to hold the army men in highest esteem and to think little of the diplomats, especially Walter Hines Page.

The interest of "The American Black Chamber" is many-sided. It has all the interest of Poe's "Gold Bug" and similar ratiocinative yarns. It should fascinate crossword puzzlers, anagrammers, and similar folk. It has meat for detective- and spy-story readers. But to me it is most important for the sidelights it gives on diplomatic practice. The essence of diplomacy has been and still, alas, continues to be, in spite of Woodrow Wilson, secrecy. One of the many devices resorted to by diplomats in their assiduous pursuit of secrecy is the use of codes. Their fellow-patriots, the spies and "secret agents," also use codes and secret inks. But just as national states have dignified diplomats into gentlemen and spies into heroes, so they have decorated with medals and more intangible honors the men who devote themselves to solving the codes and bringing the secret writings to the light of day. Yardley remarks that his work was largely destructive, for he spent most of his time for sixteen years prying into the secrets of enemies and friends of this country by destroying the secrecy they sought through codes. "We solved," he writes, "over forty-five thousand cryptograms from 1917 to 1929, and at one time or another we broke the codes of Argentine, Brazil, Chile, China, Costa Rica, Cuba, England, France, Germany, Japan, Liberia, Mexico, Nicaragua, Panama, Peru, Russia, San Salvador, Santo Domingo, Soviet Union, and Spain."

Yardley's period of greatest activity was during the war and the peace conference, and his last spurt was during the Washington disarmament conference. His stories of the struggles his bureau had with the German cryptographers and chemists is highly diverting. As one might expect, the Germans had the edge on the Allies when it came to secret inks, because of their great proficiency in chemistry. They also were exceedingly expert in devising codes. But with astonishing celerity each group canceled the edge of the other and the final issue was perilously near a stalemate. It is impossible to reproduce Yardley's stories here, and I cannot say that any of them strike me as especially significant. They are wonderful examples of human ingenuity, but that is all.

On the other hand Yardley's account of his work after the war is full of significance. By prying into the dispatches of England and Japan he and his helpers were able materially to assist the American diplomats at the Washington conference, and by publishing some of the documents he deciphered Major Yardley has performed a service to history. It appears that neither England nor Japan came to the conference with any great sincerity of purpose, but that to them the whole affair was simply one more chance to dicker and trade and avoid discussing fundamentals as far as possible. And it was Yardley's work that let the Americans know that Japan would eventually, after a fight, accept the famous ten-six ratio.

The career that Yardley made for himself might be adduced as proof of the maxim that one's hobby is sometimes more important than one's vocation. For when he was a subordinate clerk in the State Department he became interested in cryptography and spent his time puzzling over coded dispatches without benefit of the keys provided to the authorized decoders. He pursued his researches with all the avidity of the true amateur and his book shows that nothing remotely connected with the science escaped his notice. He tells us that Edgar Allan Poe knew next to nothing about cryptography and

that Voltaire's opinions on the subject were nonsense. The study of cryptography was already highly developed in Europe long before the outbreak of the war, but no one in America could pretend to expertness. Yardley therefore started his researches from scratch, and it is immensely to his credit that after sixteen years of labor he retired at the top of his profession. He had "cipher brains." If we may generalize from his case, it appears that a cryptographer must possess powers of imagination and analysis to an unusual degree. He must also be exceedingly patient and ingenious. And he must be methodical. Even when Yardley seems to attribute his success to inspiration it is perfectly clear that the true explanation is that his vast stores of information suddenly "precipitated." It is amusing to observe that his mental processes were closely related to those of mathematicians and scientific workers generally.

As to the morality of much of Yardley's type of work there is room for at least two opinions. Either one can take Stimson's dogmatic view that it is wrong or one can hold that as long as diplomacy remains secret it is right—that it is necessary and will continue to be so as long as the national state with its dubious ambitions lasts. The destruction of Yardley's bureau leaves this country pretty much at the mercy of the more realistic foreign governments that still support cryptographers. The existence of these men is an open secret. Every Foreign Office knows that its dispatches are scrutinized by both friends and enemies, and the wonder is that diplomats ever take the risk of committing their secrets to the tender mercies of foreign cryptographers. Certainly without a man like Yardley in service America is just a tender lamb among the wolves. The American State Department is at once the most autocratic and the most bungling of all the government departments. Such successes as it does chalk up are attributable not to skill and resourcefulness but to the economic strength of the country it represents to the world.

C. HARTLEY GRATTAN

Music in America

Our American Music: Three Hundred Years of It. By John Tasker Howard. Thomas Y. Crowell Company. \$6.

AT once a history, a critical commentary, and a biographical dictionary, Mr. Howard's stout volume is the most nearly complete work on the subject of American music that we now possess. Although it was his original intention to write only about the music that has been composed in this country, he was inevitably drawn into the current of musical activities. No reader will regret this, for some of the liveliest pages are those describing scenes and personalities, and these passages offset the dryness of occasional stretches that have the brevity of a catalogue.

Structurally, this valuable reference book is divided into three parts: Euterpe in the Wilderness (1620-1800), Euterpe Clears the Forest (1800-1860), and Euterpe Builds Her American Home (1860 to the present). The style varies from a prosaic flatness in factual sections to a genial humor when the author lets himself go. Considering the large amount of material presented and the days of labor which must have gone into its selection and arrangement, one is struck with admiration at Mr. Howard's high spirits in the actual writing. Dull he undeniably is at times, but that is when he is buried in data.

Reminding us that the new is ever old, he discloses our first modernist composer in the person of William Billings of Boston, who wrote in 1778 a completely discordant piece entitled "Jargon," prefacing it with a manifesto which might, with a few changes, be applied to the music of George Antheil. Coming down to 1853, we meet another forerunner, not a

mere composer this time, but a conductor-composer who knew all the tricks of showmanship. Louis Antoine Jullien directed classical symphonies with a jeweled baton held in a white-gloved hand, and wrote a "Firemen's Quadrille" which called for a burst of artificial flames from the ceiling of the concert hall, and the irruption of three companies of firemen dragging dripping hose.

With entertaining matter of this kind Mr. Howard enlivens a record that has its very staid and decorous moments. He has schemed, not in vain, to spare his readers all the tedium he can. He fills the dual role of a conscientious compiler and a considerate cicerone. Save on those occasions when he gives up in despair and reels off names of men and opuses in a monotone, he essays judgments on the artistic output he passes in review. That his comments are more often kindly approbative than keenly critical is not surprising.

With his estimates of composers one need not be in accord, as, for example, when he assigns eleven pages to Ethelbert Nevin and only three to Arthur Foote. Many a reader too will note the omissions from the chapter on contemporary composers. Without any particular racking of memory, I can think of at least ten whose names are missing. But the overlooking of a few in so large a field was well-nigh unavoidable. Absolute perfection in a work of such laborious detail would have been little short of a miracle.

RAY C. B. BROWN

Tully Rounds It Out

Blood on the Moon. By Jim Tully. Coward-McCann. \$2.50.

THIS is the fifth and, according to his preface, the last volume of Jim Tully's rambling autobiography. Coming after "Beggars of Life," "Circus Parade," "Shanty Irish," and "Shadows of Men," it rounds out the best and most complete series of studies of a passing phase of the American underworld that we have had. Jack London was on the road only a few months. Edward Dahlberg, who in "Bottom Dogs" wrote a powerful book, did not touch on any of the professional aspects of underworld life. His protagonist was only a waif. Harry Kemp was the roving poet as self-conscious about seeing "life" as the bumming college student. Josiah Flynt, to whom Tully gives the palm, I do not know. But except for Flynt, Tully alone knew the life as a bona fide part of it, as road kid, hobo worker, itinerant pugilist, and finally as struggling writer. It took Tully ten years to get his first book published. He is still growing. He writes better with each volume. Only Tully knows how much guts it has taken to develop his writing gifts to the point where he can produce such a book as this. There never was a tramp of any kind with some smattering of education, I suppose, who did not plan to write a book about himself some day. Tully was willing to struggle ten years in order to arrive.

Of course he sees the world through pink spectacles—in spite of the sordidly realistic parts of his books; of course he is a romantic egotist; of course he is an Irish sentimentalist; and of course he is an unmitigated story-teller—in a double sense. But he is at the same time essentially a passionately sincere story-teller with an imagination controlled, if by nothing else, by a fine sense for the value in his material.

In some respects this last volume, although it is less ambitious, is the best of the series. It is more than well written—it contains a generous amount of that enchantment which is always to be found in the Tully autobiographies. In form it consists of a series of stories, ranging the years chronologically, about Tully's early life from the orphan-home days to the beginning of his literary career. Its part in the series is to pick up loose threads left over from the four other books and

fill in some of the gaps. I cannot imagine anyone who has a sound head and a decent heart reading Book II unmoved or without admiration. In these last hundred and fifty pages the author has achieved a fitting climax to his work.

The days that Tully writes of have passed. The whole aspect of the road and of the shifting underworld has changed and is continuing to change with increasing rapidity. That is one reason why this work of his is a valuable contribution. Meanwhile, one's curiosity grows as to the nature and quality of the future books of a different order which Jim Tully promises us.

FRED T. MARSH

Man Makes a World

Modern Civilization on Trial. By C. Delisle Burns. The Macmillan Company. \$2.50.

DR. DELISLE BURNS has, to an unusual degree, the gift of lucid exposition. This gift is used with excellent effect in this, one of his best books. It was Professor Alfred Zimmern who declared that all pre-war political theory would have to be rewritten. Dr. Delisle Burns gives point to that remark. His theory does not float in the air. It is related to what he terms "modernity" and to the "new industrial revolution," with its large-scale methods of production and its new demands upon intelligence. He confronts us with a tiny, buzzing world—our world—which it is possible to circumnavigate by air in ten days; where a number equal to the entire population of the United States visits the picture theaters in that country every week, and where, even in Japan, the yearly attendance at the cinema is twice the population of the country; where in many an African district gramophones are to be found in almost every large hut; where radio sends a message round the globe in a few seconds. He insists that these facts are of as much significance for political theory as the propositions and ideals of Plato and Aristotle.

Inevitably the customs and demands of European-American civilization impinge upon the habits of primitive peoples, impinge upon the traditions of the Orient. Dr. Delisle Burns devotes two chapters to discussing the resultant problems. He quotes André Gide's description of a gang of hostages in French Congo, taken because an African village had failed to supply the requisite number of porters for forced labor demanded by the administration, "escorted by guards armed with five-thonged whips, a line of fifteen women and two men, tied by the necks with the same rope." The arrival of civilization appears to wear much the same aspect in 1927 as it did in the sixteenth-century Peru of Pizarro. The degradation of the industrial revolution of the West has been reproduced and emphasized in the East and especially in factories controlled by Oriental employers. To this extent the world does not change. Slowly, however, the new technological forces, when intelligently directed, are making their influence felt. The notion slowly makes headway that social institutions and social health or lack of it are not in the nature of things, like the climate, but are capable of being controlled and improved. The cinema gives peasant populations sight of other methods of life than their own. For good and for evil it is an immense dissolvent force. In India villagers are instructed in agricultural methods by radio. The result is a change in the entire outlook on civilization. As that very distinguished Chinese, Dr. Hu Shih, has said, "For me that civilization is materialistic which is limited by matter and incapable of transcending it. . . . Moral technology is highly spiritual because it seeks, through human ingenuity and intelligence, to relieve human energy from the unnecessary hardships of life and to provide for it the necessary conditions for the enjoyment of life."

The effect, however, of the new technology and of the related spirit of modernity is not solely, or even primarily, upon remote civilizations and peoples. The chief issue is within our own borders. The characteristic quality of these new influences is mobility. There are, on the other side, forces with which Dr. Delisle Burns has as little sympathy, which stand for immobility. This spirit results in South Africa in refusal to allow a native to travel more than a few miles without a permit. In Europe "politicians and business men are attempting to modernize the old village pump; the majority still believe in the old pump; and an antiquated history and an absolute sentimentalism are decorating it. . . . But what we want is a new water supply." Dr. Delisle Burns's outlook is broadly that of H. G. Wells, but with talk of an international aristocracy with its own tradition—a samurai—and with most of the discussion of the revision of democracy left out. Dr. Delisle Burns admits that the insurgence of nationalism and the rise of dictatorships are modern-enough phenomena. He points out, however, that dictatorships have arisen exclusively in the more backward parts of Europe and that, by the actual measurable tests of advance in health and literacy, the lands under dictatorship do not compare well with democracies. To put it bluntly, dictators, despite their noise, do not "deliver the goods." They do, however, stand for the forces of localism, insulation, and immobility. Aldous Huxley, speaking for the modern spirit, has rediscovered the Fall, but not Salvation. Dr. Delisle Burns, also speaking for this spirit, brushes aside alike the pensive Huxleys and the activist Mussolinis. He provides us, with singular charm and persuasiveness, with an announcement of practical salvation, into which all men of good-will can enter. He has the courage to undertake the long overdue criticism of polite and classical standards. "What is in a decline is not the modern world, but traditional criticism." He argues that our world, steadily becoming smaller, is one in which cooperation is now imperative. The machines are on his side. This is an extraordinarily competent exposition of political modernism, full of good things, which those who may disagree with internationalism can least afford to neglect.

GEORGE E. G. CATLIN

The Autobiography of a State

Vermont Verse. Edited by Walter John Coates and Frederick Tupper.

Vermont Folk Songs and Ballads. Edited by Helen Hartness Flanders and George Brown.

Vermonters: A Book of Biographies. Edited by Walter H. Crockett.

Vermont Prose. Edited by Arthur Wallace Peach and Harold G. Rugg. Brattleboro, Vermont: Stephen Daye Press. Each \$1.50.

THIS four-volume series of anthologies has been printed as a major project of the Committee of Traditions and Ideals organized in 1929 under the Vermont Commission on Country Life. The attempt of the editors and the advisory board of literary artists is to present the "musings and thought of a State."

Such a project is worth while as social history and as a background for the social criticism of literature, but writings so collected are likely to prove of very little artistic merit. The only one of these books which will be read and highly valued by many readers is the collection of "Vermont Folk Songs and Ballads." This particular volume adds many new examples to our collection of American balladry. Among these there are new versions of old ballads and a few completely new broadsides and songs which have grown up as a result of

events occurring within the State of Vermont itself. The work of collecting has been done by a great many ardent students of old songs, but all the collectors have worked under the same general system and the results are authentic. The book is a fine one.

The "Biographies" will prove more interesting to Vermonters than to the general reader. Only a few famous names are included: the inevitable Calvin Coolidge, and Robert Frost, of course. The most interesting and illuminating material is to be found in the biographies of such pioneers as Ethan Allen and Walter H. Crockett. Here is vivid history.

Vermont prose has little greatness until it draws upon the writings of such a visitor as Rudyard Kipling, who spent a winter in Vermont after his marriage to a Vermont woman. Nor is Vermont poetry very exciting save for the genius of Robert Frost, but "that has made all the difference."

EDA LOU WALTON

Southern Labor's Challenge

When Southern Labor Stirs. By Tom Tippet. Jonathan Cape and Harrison Smith. \$2.50.

THE recounting of the stories of the first great strikes in the South during its present period of rapid industrialization facilitates the understanding of the labor problem in that new industrial empire. Tom Tippet is one of the few persons who have passed through the strategic struggles at Elizabethton, Gastonia, Marion, and Danville. He is that envied reporter who has been sufficiently on the inside to acquire a realistic approach to the strikes he describes and sufficiently on the outside to be able to make an appraisal of them not shot full of prejudice. Now he has set down his observations, and enlivened the text with a generous number of illustrations.

Except for the strike at Gastonia, North Carolina, the revolts of Southern wage-earners have been officially under the auspices of the American Federation of Labor. At Gastonia the fight was led by the National Textile Workers, which incidentally is not "a union affiliated with the Communist Party" as Mr. Tippet describes it, though it is under Communist control. At Elizabethton, Tennessee, the A. F. of L. was invited by the workers to take charge after the strike had occurred. At Marion, North Carolina, the mill operatives called in an organizer of the A. F. of L. union, the United Textile Workers, to conduct an organization campaign for them, and soon the U. T. W. found itself with an unwelcome strike on its hands. At Danville, Virginia, the United Textile Workers, upon the request of the discontented employees, had an opportunity to prepare the ground for the kind of battle it preferred by months of agitation. Yet all these strikes were failures. Employers did not distinguish between Communists with their class-struggle philosophy and adherents of the A. F. of L. with their preachments of class collaboration. Judges imprisoned strikers, policemen and troops beat them up and shot them, and middle-class elements maltreated them, no matter what the political beliefs of their leaders. This is one lesson of the Southern rebellions that Mr. Tippet points out.

There is another moral to be drawn from the recent industrial disputes below Mason and Dixon's line. Victory will not come to the workers without adequate mobilization of all labor's resources before, during, and after strikes. Danville saw the most careful plans laid before the outbreak of hostilities, but the insufficient relief that the trade-union movement and its friends could summon finally defeated the strikers. At Gastonia the red hysteria nullified the efforts of all the Communists' ramifying publicity, defense, and relief auxiliaries. At Elizabethton and Marion the United Textile Workers could

not cope with the financial burden thrust upon them, and when the strikes were liquidated nothing was done to preserve the morale and organization to prepare for a better fight. The same thing seems to be occurring in Danville. Standing out from the distressing account of the deficiency of the American Federation of Labor in militancy and farsightedness is the glorious work of the Emergency Committee for Strikers' Relief and other groups.

Mr. Tippet's narrative might have been more rousing and more colorful had he been less restrained in his criticisms, but his soberness makes his analysis all the more challenging to the organized labor movement, which is thus called upon to meet its responsibilities in the South with intelligence, idealism, and hard cash.

LOUIS STANLEY

Changing Japan

Economic Aspects of the History of Civilization of Japan. By Yosoburo Takekoshi. The Macmillan Company. Three volumes. \$16.50.

Japan's Economic Position. By John E. Orchard, with the Collaboration of Dorothy Johnson Orchard. McGraw-Hill Book Company. \$5.

Realism in Romantic Japan. By Miriam Beard. The Macmillan Company. \$5.

FROM ancient times to the present the Japanese have been exceptionally clever in adapting foreign civilizations to their needs, and peculiarly successful, through every change, in preserving a Japanese national spirit. Chinese and Korean cultures first furnished the borrowed elements; now Western civilization is offering models to Japan. An instinct for change native to the race is shown in all three of the works listed here.

Yosoburo Takekoshi is the Japanese author of three volumes of economic history. This work could never have been written by a foreigner, even granting he knew the language for source materials and had become well acquainted with the scene during one lifetime. For there is a wealth of intangible racial material present. The author was well equipped for the task by previous experience in historical research. (At the age of thirty-one he published "2,500 Years of History.") Writing in English, at the age of fifty-three and out of a rich background of Japanese life, Mr. Takekoshi not only knows the history of Japan thoroughly, but also the history of other countries on which he makes comparative remarks. These volumes were written, or rather compiled, from the original archives, by enormous financial backing, numerous workers, and competent assistance of every kind.

It is history from the economic viewpoint. The first cause of history, says the author, is an economic one. Thus the work is divided into seven political epochs, showing the economic evolution of Japan. Mr. Takekoshi begins Japanese history—as do all sober historians—by dating from 300 A.D. and deriving from Chinese and Korean sources. The first period (to 956) marks the rise of the imperial family to central power. The second period, extending into the twelfth century, treats of the modification of Chinese codes, of the destructive effects of civil wars upon the social institutions of Japan, and of the development of a feudal system. The third period (to 1350), one of comparative peace and social stability under the feudal system, is shown to culminate in the power of a military class. The fourth period (1350-1550), the time of the opening up of the country to foreign trade with the Portuguese, the Chinese, and the Koreans, the author has likened to the period of the merchant guilds in Europe. The fifth period (1567-98) covers the life of the rude military leader, Hideyoshi, who uni-

fied the country, made reforms in the free-trade policy, and took a land census. (Hideyoshi invaded Korea and was repulsed by the use of a primitive submarine, invented by Koreans at this time.) The sixth period, lasting 270 years, includes the collapse of the Shogunate and the rise of the agricultural classes. The seventh period, or the *Meiji* (from 1867 to modern times), the author scarcely touches.

Since this work is so important—never before has Japanese history been presented with such authority to the West—it is unfortunate that it was written under the auspices of the most powerful statesmen of Japan and by a man himself a defeated political candidate. His object in writing the book was a patriotic one, that of educating Europe to appreciate Japan. Thus the good things and the bright side of Japanese civilization are held up to the light exclusively, and the dark terrible things, such as are to be found certainly in any race's history, are uniformly covered up. The author does not mention the forcible transportation of Korean artists and craftsmen during the sixteenth century, which was very important to Japan economically. Nor the savagery of the mound of ears and noses brought back from an invading expedition and commemorated in a lasting monument. The Chinese and Korean names, it must also be added, are given no consistent spelling, some being rendered into Japanese, while others are not, so that the reader is confused.

Professor Orchard in his book deals with Japan since the modernization by Western influence. He discusses the question of population in Japan, which has been increasing at the rate of 900,000 annually since the fall of the Shogunate, and he suggests birth control as a possible solution, citing the views of several Japanese as favorable. But in my opinion his views are utopian, and he does not understand Japan if he considers that at present a possibility under state sanction. He does not think that Japan can be a rival to the great Occidental Powers owing to an important lack of fuel and iron. He is unfortunate when he touches the Korean and Manchurian situations, for he has gained his information through propagandist papers in Japan, without investigation, and relies entirely on them. He too uses the Japanese names for Chinese and Korean places. Professor Orchard, with his wife as collaborator, prepared his study under the auspices of the University Council for Research in the Social Sciences of Columbia University. He has traveled extensively, doing an enormous amount of research and making a great many statistics. But of necessity he has used books and periodicals published in English almost exclusively as source material, so that it seems likely that anybody as industrious as Mr. Orchard could have written this book in America without going to the Orient. It is to his credit however that he seems to have utilized virtually everything published in English and has reduced it to compact form in this book.

Miss Beard has also read extensively on Japan in English translation and has a substantial knowledge of Western civilization obtained from the standard books, on which she draws in her running account. She shows a keen appreciation of Japanese art, geisha dancing, the *No* dramas, the tea ceremony. She desires to look on the bright, optimistic, prepossessing side of Japan, and is interested primarily in feeling its aesthetic and artistic spirit.

To sum up these three books, Professor Orchard's makes a very good summary and will be found helpful to the student. Miss Beard's book is not for the student, but will be found entertaining by travelers who contemplate going to Japan. Mr. Takekoshi's book is the most important and the most authoritative, but is not for the lay reader, because nobody wants to be bored. The English is perfectly correct, but is very dry. This argues that something is lacking, for history is not of necessity boring.

YOUNGHILL KANG

Books in Brief

A Modern History of the English People, 1880-1922. By R. H. Gretton. The Dial Press. \$5.

The issuance in one volume of Mr. Gretton's three-volume history may be expected to give new life and continuing interest to a unique work whose first two parts, published in 1912 and 1914 respectively, may well have been somewhat forgotten before the third appeared. Mr. Gretton's theory of history may be gathered from his statement that while a review of English life in the forty years which he covers "is neither misleading nor frivolous if it finds the vogue of a music-hall song sometimes more significant of national temper than an imperial conference, or gives as much space, on occasion, to a sensational crime as to international relations," the songs and the crimes were nevertheless "taking place in a world changing steadily, not because of them, but because free trade and protection had come to grips again, because the great dominions were changing their status, because the Great War was looming, because the Irish Free State was in the throes of birth." He accordingly undertakes to reconcile the two points of view by dumping into his pages the contents of his notebooks and arranging them in a narrative as kaleidoscopic as the material in a daily newspaper. The result, whatever an orthodox historian may think of it, is probably fairly near the actual history of which the English people have been conscious. Some of the personal characterizations of the great or near-great are penetrating and clever. The detailed narrative really ends with 1919, the following three years being disposed of in about eleven pages.

Memoirs of Garibaldi. Edited by Alexandre Dumas. Translated with an Introduction by R. S. Garnett. D. Appleton and Company. \$5.

It was as a filibuster in South American revolutions that Garibaldi got the experience that was to enable him to become the "Liberator" of Italy. The record of these adventures which he excised from his autobiography in soberer after-years was preserved in the earlier version now restored to us by Mr. Garnett's devotion. It is an astonishing record of an astonishing man, sentimental, wildly romantic, a hero not too proud to boast or to have a good cry. Dumas's editing has given it a high fever of melodrama, but the book makes exciting reading and is an important document for the history of the events of the period.

Stories of the South, Old and New. Edited by Addison Hibbard. The University of North Carolina Press. W. W. Norton and Company. \$3.

Here are twenty-seven stories of the South. Mr. Hibbard's aim has been not so much to provide an anthology of the best short stories by Southern writers, as to collect into one volume a group of tales written during the last one hundred years which should together touch upon every aspect of Southern life. His anthology is not of Southern writers but of the South. Consequently there are some extraordinary omissions and a few unfortunate choices. But the volume is an interesting one. Some of the stories are old favorites—O. Henry's *A Municipal Report*, Cable's *Jean-ah Poquelin*, Irvin Cobb's *Words and Music*. Joel Chandler Harris, Lafcadio Hearn, Thomas Nelson Page are all here. But the more recent writers are given the largest share of space—Elizabeth Madox Roberts, Lucy Furman, Paul Green, DuBose Heyward, Julia Peterkin, Lyle Saxon, and many others. Negro writers are Benjamin Brawley, Charles C. Chestnutt, and Paul Dunbar. In the opinion of one reader, George Madden Martin and

the late Pernet Patterson carry off highest honors—the first with a story which involves a lynching, and the second with a tale which should be included in all future anthologies of the best American short stories—*Buttin' Blood*.

The Bitter Orange Tree. By Panait Istrati. Translated by Rosalind Zoglin. The Vanguard Press. \$2.50.

This story of a beautiful girl who, after arousing rivalry in the youthful breasts of two Hungarians, falls into a ditch and is discovered years after by the two youths selling apples and oranges in a brothel, has some qualities to admire, among them the exuberant lyricism of the style. The improbabilities that end finally with the drowning of the beautiful girl in the Danube are less commendable. Some episodes, especially the berrying expedition, have a certain distinction independent of the main story.

Last and First Men: A Story of the Near and Far Future. By W. Olaf Stapledon. Jonathan Cape and Harrison Smith. \$2.50.

This is surely the most ambitious scientific romance ever projected into the future. In it the story of humanity is traced for the next two billion years. An invasion from Mars followed by a flight to Venus and, a few million years later, a final migration to Neptune are all described in their technical details. No less than eighteen races of men, each a new species evolved from its predecessor, succeed one another as civilizations rise and fall by the hundreds. Mr. Stapledon's myth is not light reading. But it is a stimulating and absorbing story written in the true spirit of a scientific age.

This Our Exile. By David Burnham. Charles Scribner's Sons. \$2.50.

In spite of an irritating lumpiness in the characters, in spite of the unashamed and open imitation of Ernest Hemingway's sentences, mannerisms, and persons, in spite of the heavy talk and the smugness and the reversion to type of the author's favorites, this first novel about a rich, Catholic family that loses its faith and general purpose in life when the father dies has its good points. The mother, whose letter of interference and explanation ends the book, is a well-rounded character. There are graphic accounts of death and the despairs and griefs that attend death.

The Navajo Indians. By Mary Roberts Coolidge and Dane Coolidge. Houghton Mifflin Company. \$4.

This is another of the succession of excellent books dealing with the aboriginal Americans the appearance of which in the past year or so is of itself testimony to the liveliness of public interest in this field. Mr. and Mrs. Coolidge have chosen the largest and perhaps most interesting tribe in the United States for their study, and as the study has been first-hand, as well as sustained by full survey of the records and of previous work, their volume is one of the best that has appeared. It is particularly valuable to the inquisitive public which throngs yearly through the Indian country, skirting or crossing the Navajo reservation, witnessing dances, purchasing blankets and silver—the two outstanding artistic products of the Navajo nation. The history of these arts of weaver and silversmith, both relatively recent in development, as well as the methods and meanings of the products, is made clear; but the authors have gone far beyond any mere purveying to a collector's interest and have given a fine interpretation of the whole tribal spirit and tradition. There is also an intelligent discussion of the Indian's relation to the government and to other interracial forces, and a by no means pessimistic forecast of the future of this gifted native people. The volume is illustrated with splendid reproductions of photographs taken by the authors.

Labor Fights For Bread

Coal miners strike by thousands, march on cities demanding food; textile workers strike against pay cuts, send many hundreds to jail via picket lines; breadlines, soup kitchens, flop-houses close, yet employment sags and wage cuts grow more numerous. Not for 40 years has the question been so vital, "What will Labor do?"

But 40 years ago there was no Federated Press keeping 100 correspondents watching hot spots in U.S.A., U.S.S.R., China, Germany, Mexico, Austria, England, for labor news to be boiled down for the busy reader who wants to know of labor's struggles in a few minutes a week, in

Out of Their Own Mouths

Connie Bennett and Lew Cody are painting Paris pink. Lew keeps the joy joints working overtime. Connie gets tired waiting for Lew to keep a date with the preacher and leaves him flat. Joel McRea is an artist. He's painting old Mother Eve and needs a good model bad. Connie, down to her last dime, asks for the job. Covered with blushes she poses. P. S.—She gets the job. Joel works fast on the painting. And faster on Connie. Two weeks later she's fixing his breakfasts for him.

THUS begins the account of "The Common Law," the recent "smash" at the Mayfair, in a full-page advertisement in *Variety*. The advertisement is prefaced with an apologetic "Pardon my vernacular," said the salesman to the exhibitor. But the apology is quite unnecessary: the vernacular fits the story like a glove. I wish I had space to let the reader taste the full flavor of this exciting narrative. That thrilling scene, however, when Connie "covered with blushes" poses before the artist, deserves another quotation. As the advertisement informs us, "by the time she walks into that studio and proves that the French models have nothing on her, she owes the customers nothing. They really ought to pay another admission to see the rest of the picture."

"Sales talk," you will say. Precisely. But pictures are made to be sold, and what the salesman says out loud the producer has previously thought out in the seclusion of his office. These confidences to the trade are a valuable testimony of what Hollywood sets out to achieve in its films. Another advertisement from the same firm, listing "sales angles on 'The Common Law,'" throws further light on the nature of attractions considered essential for the success of a film. Here are some of these "sales angles": "Constance Bennett as an artist's model in gay Paree." "Her philosophy of life and love crystallized in the phrase: 'I don't care what people say, as long as you say you love me!'" "Men called her the perfect woman" is a sales angle to interest both men and women." "Magnificent production. Exemplified by the gorgeous sequence of the 4-Arts Ball in which over 500 players take part." "Constance Bennett's reputation as the best-dressed woman on the screen, plus the gorgeous clothes designed for her in this production . . . are naturals for merchandise tie-ups, fashion shows, etc."

Poor Miss Constance Bennett. An attractive woman and a capable actress, as she demonstrated in one of her early pictures, "The Son of the Gods," she has been turned into a characterless dummy wound up every time to go through the same set of flat and maudlin emotions. But what can one do, when business demands "glorification of love" as love and glorification are understood in Hollywood?

One more example of this profound understanding may be quoted from an advertisement of another producing company: "Morals for Women." A startling insight into the code of a kept woman. A provocative theme to excite the curiosity of the movie-going public."

I am sorry to say that there is quite a quantity of such hokum, though of the Russian variety, in that otherwise superior picture, "A Jew at War" (Cameo). Its war scenes and its portrayal of life in a small Jewish town are impressive, if somewhat sketchy. The German picture "The Immortal Vagabond" (Warner's), with a skillfully grafted English dialogue, also deserves attention for its acting, Tyrolean background, and sensitive direction.

ALEXANDER BAKSHY

Youth at the Gateway of India

By J. R. GLORNEY BOLTON

Bombay, July 1

LORD IRWIN was leaving the shores of India. The guns boomed across the lovely harbor. Troops, massed in thousands, princes, and half the dignitaries of India watched the little launch that was taking the great ex-Viceroy from the Gateway of India into mid-stream, where the S. S. Viceroy of India awaited him. The Viceroy's last words before stepping into the launch—"in all your thinking, in all your speaking, and in all your doing, may God be with you"—still ring in the ear. From another Viceroy those words would have spelled hypocrisy; and there is nothing to match the hypocrisy of English public men: conceive, if you can, of a British prime minister who is too audacious in thought and action to be invited to address the annual conference of free churches.

And those words, sincere though I believed them to be, did not convince everyone. For, just as there is an old India and a new India, so there is an old Anglo-India and a new Anglo-India. The old Anglo-India has been described and condemned in the American press a thousand times. Its snobbery and middle-class flunkeydom, its sadistic persecution of men whose only crime is their youth—these features are known to the American public. They are known also to India, which explains half the present conflict. Pandit Motilal Nehru was only one of thousands of Indians who, personally resenting the arrogance of Englishmen, joined with the Nationalists.

Old Anglo-India is not yet dead. A generation of Englishmen who arrived in India before the war avoided the call of active service and made staggering fortunes, while more patriotic and often far abler men risked their life for "a bob a day." Now most of them, after ten years of lavish and very tedious entertaining in the land they professed to love, have lost their money in the slump; and, of course, they are bitter. They look upon the advocacy of Indian reform almost as a betrayal.

And they do not like the young men. There is a new generation, and it has new ideals. It looked upon Lord Irwin—the Lord Irwin who stood behind the frigid Indian Civil Service he could not completely dominate—as its leader. "The trouble with Lord Irwin," said a prominent representative of the older generation in Bombay, "is that he thinks a Christian can govern India." He little guessed how his remark angered his younger listeners, some of whom happened to be agnostics.

There is a change in the dynasty of ideals. It is easier for the young than for the old to recognize new ideals. The old wish the *ancien régime* to continue. It is more comfortable and, for the European, more privileged and select. But the younger men have entirely different views. To begin with, many of them are better educated. After the war Englishmen realized that America did the right thing in encouraging her best type of citizen to enter business. It is now so normal for a public-school man fresh from Oxford to enter business that it passes without comment.

But before the war it was not a common feature of English life. And the pre-war business man in India meets a younger assistant who, while thoroughly efficient in his work, is yet prepared to bring a trained mind to bear upon the political problems of India. And since he is better educated, since he is something of a post-war Socialist, he is also less desirous of show, privilege, and rank. And by his character they judged Lord Irwin as Viceroy.

Before Lord Irwin left, more than one hundred Europeans in Bombay—all of them under the age of thirty-five—decided to send a letter to him thanking him for what he had done. They knew that conditions would change fundamentally. The old generation that speaks so barrenly and pontifically through the European Association would soon be gone. The younger men—such as the men who sent their letter to Lord Irwin—would remain. Englishmen would no longer be the governing class. They would become, instead, a group of foreigners. Yet the signatories to the letter to Lord Irwin maintained that the Viceroy had done the right thing. They declared that "the burden which your patient statecraft places upon our shoulders is one which no adventurous Englishman would wish to cast down. Whatever seeming loss there may be in privilege and prestige, there is no loss whatever in the opportunities of individual service and personal influence."

There was another and even more imposing ceremony at the Gateway of India when the "great of the land" greeted the incoming Viceroy and Lady Willingdon. The Willingdons knew their part. The Viceroy-elect "looked every inch a soldier." Lady Willingdon was delighted. Want of courage, I am told, prevented a distinguished journalist from cabling: "The Countess of Willingdon gave herself a hearty welcome." Socially, indeed, the return of the Willingdons was an event. There will be many brilliant functions; and—unless the democratic habits of Canada go with the Willingdons to Delhi and Simla—the flunkeydom of Anglo-India will assert itself once more. One of the well-known ladies of Bombay, overjoyed by the news of Lord Willingdon's appointment, declared: "So kind and sympathetic—so different from the Irwins."

And that, unfortunately, is true. The Willingdons are essentially different from the Irwins. Lord Irwin looked out of place at the Gateway of India because he has no sympathy with show and ceremony. He likes to work without ostentation. This demand for an ostentatious viceregal handicaps the British Government every time it has to look for a new viceroy. It is an open secret that Lord Willingdon was by no means Ramsay MacDonald's first choice. He chose Lord Gorell, and a very high influence prevented the appointment. He chose Lord Thomson, and Lord Thomson perished with the R-101. He chose Lord Sankey—the Lord Chancellor who did so much to bring the Round Table Conference to a successful conclusion—and Lord Sankey refused because he could not have endured the social functions of the viceregal office. Sometimes great

ability and love of show go together; Lord Curzon was a great viceroy and a great showman. But this combination is rare, and the young men in India view the return of a showman-viceroy with profound misgiving. Their only hope is that Lord Willingdon, showman though he is, will realize that the days of show in India are over. Modern India wants no show. She has heard of the working of democratic America and pseudo-socialistic England. She has seen a Mahatma win the loyalty of the masses not by a regal show of power, but by the apostolic simplicity of his mission and daily life. Briefly, she believes that show exists not for the benefit of Indians, but for the satisfaction of middle-class Europeans who are never likely to be received in London society and so resolve to make the best of the opportunities which, hitherto, the helplessness of Indian opinion has provided for them.

The test of the Englishman's authority in India—old and new—is not show, but character. Lord Irwin, who reduced public ceremony to a minimum, left behind him the record of great character, and that is why his departure marked something more than a change of viceroys. It brought to the young men of the new Anglo-India a loss of leadership which they will hardly know how to replace. Perhaps American journalists are still sending to New York, Chicago, and Boston their views of the flunkeydom of Anglo-India. They are views which I share fully. But they have misread the signs of the times if they cannot detect the revolt of the young Englishman and his demand for a more intelligent, more sympathetic, and more self-sacrificing European leadership.

APARTMENTS FOR SALE

First Rochdale Cooperative House—Manhattan
Safe investment—rent actual cost
Seven years' successful operation. 3 rooms, kitchen, bath, fireplace, cross ventilation. Christopher St. Station, 7th Ave. Subway.

Tel. Walker 5-7394 64 Barrow St.
Apartments can be seen any day after 1 P. M.

□ APTS. FOR RENT □

UNFURNISHED APARTMENTS

65th STREET, 7 and 9 WEST—"Just Off Central Park West." Attractive, light apartments in an accessible location near Central Park. 1 ROOM and Private Bath from \$45 monthly (some with wood-burning fireplaces); 2 ROOMS with Private Bath and Kitchenette from \$65. Also 4 ROOMS at \$100. Woodburning fireplace. Apply Mr. Worthington, 7 West 65th Street, N. Y. C.

RIVERDALE

2½ and 5 room apartments. Beautiful park surroundings. Excellent values. Elevator. Refrigeration. 3900 Spuyten Duyvil Parkway or phone Wickersham 2-6200.

FOR RENT—One room, bath, studio apartments in charming quiet well-kept house near Sheridan Sq.—large garden, fountain, trees; electrical cooking, fireplaces, cupboards—\$45-\$50. Some with electrolux \$57. 74 Charles St. Watkins 9-6222.

REAL ESTATE FOR RENT

FOR RENT—a 56 acre estate; one 8 room house; all improvements; one 5 room bungalow; all improvements; garage, magnificent views; suitable for two families; reasonable rent. Arnold Krimont, Croton-on-Hudson, N. Y. Tel. Croton 777.

FOR SALE

LEAVING for Soviet Union. Sell completely furnished 2 room bath, kitchenette, apartment. Linen, silverware, radio, phonograph, records. Books optional. Rent \$50. Southern exposure. Living room 28 x 24. Tel. End 2-6942 before 10 A.M. or write Deutsch, 214 W. 72nd St.

APARTMENT TO SHARE

CULTURED American Jewess, 30, enjoying golf, music, books, would establish apartment with congenial young woman, having same interests. Has complete furnishings; piano; radio; library. Choice of locations. Box 476, c/o *The Nation*.

□ APTS. FOR RENT □

FURNISHED OR UNFURNISHED

44th STREET, 141 EAST—"The Woolsey." Housekeeping apartments in a modern elevator building convenient to business, shopping and amusement districts. Attractive layouts. Compact Kitchenettes with Electrolux refrigerators. 24 hour switchboard service. 1 ROOM from \$70. 2 ROOMS from \$80. Furnished if desired at slight additional charge. **SPECIAL SUMMER RATES ON APPLICATION.** See Mr. Bayly.

109th STREET, 309 WEST—"The Edgerton." A step from *Riverside Drive*. Housekeeping apartments. Half block from Broadway. 5th Avenue bus and subway 1 block away. Convenient to Columbia University. Very desirable apartments. Complete kitchenettes with mechanical refrigerators. 1 ROOM from \$65. 2 ROOMS from \$75. Furnished if desired at slight additional charge. **SPECIAL SUMMER RATES ON APPLICATION.** See Mr. Lewis.

45th STREET, 325 WEST—"The Whitby." A modern elevator building, conveniently located just off Times Square. Housekeeping apartments with full hotel service available. 1 ROOM, Kitchenette from \$70. 2 ROOMS, Kitchenette from \$80. 3 ROOMS, Kitchen from \$90. 4 ROOMS, Kitchen from \$135. All apartments have mechanical refrigeration. **SPECIAL SUMMER RATES.** For example:—1 ROOM tastefully furnished, kitchenette and private bath, mechanical refrigeration—from \$22. weekly with full hotel service! See Mr. Funk.

ROOMS

WILL rent part of delightful apartment, Washington Sq. Section. An exceptionally large room and alcove. Furnished in massive walnut. References exchanged. Call Tompkins Sq. 6-6893, for appointment, any evening.

THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York. British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London, W. C. 1, England.

IT WOULD HAVE BEEN a bold prophet who even a few months ago would have ventured to predict that before the summer was over we would be regulating industry in the United States by martial law. Yet that is the situation today in Oklahoma and Texas. In the former state there has been virtually a complete shutdown of the oil wells since Governor Murray called out the troops. On August 12 the Texas Legislature rushed through an act to restrict oil production in Texas, and before a week was out Governor Sterling had troops in the East Texas oil fields. This at present is the most important oil field in the United States; it has recently been producing more than 700,000 barrels of oil a day. Now under the order of the Texas Railroad Commission this will be cut down for the time being to less than 300,000 barrels a day, a restriction which may greatly affect the price of crude oil. Thus, confronted with a collapse in oil prices, individual States are putting into effect dramatically and drastically proration measures that the Federal Government might long ago have worked out in a milder and more orderly form.

THE INDISCRETIONS of the wayward assistant secretaries in Washington are really becoming appalling. Apparently they have little loyalty either to the philosophy or the policies of the Hoover Administration. There is, for example, the statement of Ferry K. Heath, Assistant Secretary of the Treasury in Charge of Public Buildings, in which he declares that the Treasury has had enough of

hiring private architects to design public works. Why? Because the past year's experience has proved that the government's own architects are better. In order to speed the President's emergency building program, Mr. Heath explains, the Treasury let out a large number of designing contracts which otherwise would have been handled by the government staff. For some inexplicable reason, the private firms could not compete in speed and efficiency with the government's own construction. Now this may all be true, but how does it look for an undersecretary to confute in the public prints the President's confirmed belief that private agencies are invariably preferable for such work—provided they are given adequate remuneration? Were Mr. Heath alone in his misbehavior, it might be dismissed as an inadvertence. But there is also the Assistant Secretary of Agriculture, R. W. Dunlap, who has been justifying wage cuts in private industry—in a speech which he delivered only a few days after President Hoover had repudiated Secretary Lamont for his letter to the same effect. We are all for getting to the bottom of this reprehensible insubordination and commend these instances to the Republican National Committee as evidence of another conspiracy to discredit the Administration.

ELSEWHERE IN THIS ISSUE we publish a letter written by a worker at Boulder Dam, where fourteen hundred men are now on strike. That this letter in no way exaggerates the conditions of work and life there is indicated by the press dispatches and official statements that have appeared in the few days since it was written. While Secretary Doak and other members of Mr. Hoover's cabinet have been asserting frequently and belligerently that there must be no reduction of wages, the Six Companies, Inc., in charge of the work at Boulder Dam under government contract, recently reduced the wages of shovellers from five dollars to four dollars a day. The workers contend that heat prostrations have caused thirteen deaths, and that medical aid is practically not obtainable. Official figures show that a maximum average temperature of 120 degrees has prevailed at the dam during the past month. The men made idle when work was recently suspended at the dam, according to Associated Press dispatches dated August 12, faced hunger within a few days unless construction was resumed. Officials at Las Vegas say they will be unable to feed these men when the town's scanty funds are exhausted. On August 11 two hundred striking workmen were ordered from the government reservation embracing the Hoover Dam site and Boulder City, and were compelled to move their camp five miles west of the city into the desert hills. Such is civilization in America's New Mexico in 1931.

ONE OF THE MOST IMPORTANT labor trials in American history, ranking, some believe, with the trials of the Molly Maguires of Pennsylvania and the Chicago anarchists, opened on August 17 in the usually quiet little court-house in Harlan, Kentucky. Twenty-eight men, most of them former members of the United Mine Workers of

America, are charged with first-degree murder as the result of the killing of a mine guard. In Kentucky the penalty for murder is death. According to lawyers and others who have interested themselves in the case, the real crime of the defendants lies in the fact that they had attempted to organize a local of the United Mine Workers. Their efforts were followed by several days of guerilla warfare between miners and company guards, during which four persons were killed. Thus far the United Mine Workers have refused to come to the aid of their members who are on trial, the defense being left instead to other and more radical organizations. As a further result of the desertion of these men by the U. M. W. A., says the Federated Press, both the Industrial Workers of the World and the National Miners' Union are making deep inroads among the miners of the Kentucky fields. Some sixty to seventy other persons are under arrest in Harlan, charged with criminal syndicalism and similarly grave offenses. They include a clergyman who had spoken sympathetically of the hungry miners, the chief of police of Evarts, Kentucky, and two investigators for the American Civil Liberties Union. The latter two, Arnold Johnson and Mrs. Jessie Wakefield, were recently arrested after several attempts had been made to intimidate them into leaving Kentucky.

THE CHORUS OF PROTEST against the proposal to increase railroad freight rates has been growing daily. Representatives of seven large industries, who appeared before the Interstate Commerce Commission, declared the bulk of their shipments would have to be diverted to motor trucks if the requested increase were granted. The utilities commissions of South and North Dakota, Minnesota, Iowa, Nebraska and Kansas demanded immediate dismissal of the railroads' petition on the ground that the Interstate Commerce Commission was without authority to raise rates "on the mere showing of a financial emergency." The National Grange, representing 800,000 farmers, joined in this demand. Governors Ely of Massachusetts and Cross of Connecticut have sent representatives to Washington to argue that a rate increase at this time would prove "a serious handicap to New England business." On the other hand, the Railway Brotherhoods, though they first took a neutral stand, have finally declared themselves in favor of an increase. Their joint statement said nothing about wages, but their gesture was doubtless based on the very real fear that wages will be cut if the railroads' petition is denied. Should this occur the Brotherhoods must either meekly accept the wage reduction, which they have been vigorously fighting for several months, or else bring the country face to face with a nationwide strike. Thus to all appearances the Interstate Commerce Commission must decide whether it wishes to take a chance of hampering business still further by approving the requested increase, or whether it prefers to risk a railway strike by refusing its approval.

GOVERNOR ROOSEVELT of New York has called an extra session of the Legislature as a result of a decision of the highest court of his State that the resolution of last winter empowering the Hofstadter investigating committee to conduct an inquiry into the official conduct of the city of New York was limited by the failure of the Governor to sign that resolution. In order that the Com-

mittee shall have the right to grant immunity to all witnesses called before it this procedure must be followed now. As a result there is much fluttering of the political doves, the proceeding being judged purely from the point of view of the Governor's presidential candidacy, when it was only a simple duty which any Executive would have performed unless he wished to hamper the ability of a legislative committee to achieve the ends for which it was created. Some say that this will help the Governor's presidential boom by showing his independence of Tammany; others that it will cost him Tammany's precious support after the first ballot in the presidential convention. As between the two, it would be far better tactics for the Governor to oppose Tammany than to seem to be its ally or protegee. But we are sure that the Governor considered neither matter, but only his plain duty. There was really no alternative for an honest Executive.

AGAIN SENATOR BORAH has said the needed word. In an address at Boise, Idaho, to the Service Clubs, he frankly declared that the French idea of security "carried beyond its present limits," "can mean nothing less than the destruction of Germany, Austria and Hungary, and that the world will not consent to see brought about." The Chairman of the Senate Committee on Foreign Relations pointed out that France "is protected by every conceivable form of guarantee." It is a member of the League of Nations. Under the Locarno Pact, England has pledged itself to go to France's aid if Germany attacks and Germany itself has signed a hundred-year pledge of peace with France. More than that, as Senator Borah pointed out, France has what practically amounts to military alliances with Czechoslovakia, Jugoslavia, Poland, Roumania, and Bulgaria; her army numbers 560,000 to Germany's 95,000, and the latter is without guns, tanks or airplanes. France is strong and rich while Germany, Hungary, and Austria are down and out—on the verge of ruin. And still France maintains that she is in danger, and that she cannot and will not disarm until everybody else, especially the United States, guarantees her safety! Have the French really lost their courage and been conquered by craven fear? Are they convinced that the Germans are such supermen that unarmed they menace France? Or are they merely the victims of their conscienceless and scheming politicians who keep up the fear of Germany for their selfish and nationalistic ends?

GANDHI'S REFUSAL finally to go to the London Round-table Conference on India we profoundly regret. Not that we have any defence for the failure of the Government of India to live up to its obligations if, as the Indians insist, it has violated the solemn truce entered into with the Nationalist Congress. But when such vast issues are at stake we cannot see why one additional injustice could not be borne a few months longer—perhaps to be rectified. The Round-table without Gandhi will be no Round-table at all. Indeed, we cannot see how it can be held without him, and we shall hope that Gandhi will yet reconsider and go. It is most regrettable that the rigidity of English officialdom could not have been softened to the extent of allowing Lord Irwin to remain as Viceroy a few months after the expiration of his term. Had he been there in place of Lord Willingdon this break would hardly have

occurred. Meanwhile it is interesting to note that the English speaker on India at the Institute of Politics at Williams-town, like his predecessor last year, blamed the United States for all of England's woes in India. If only the United States were not pro-Indian and anti-British, said he, India would still be contentedly at England's heel! With mentalities like that loose in the world it is no wonder that Great Britain is in straits with her overseas subjects.

"IF PREACHING SERMONS about the needs of the poor and offering prayers for the under-privileged classes constitute socialism, I'll have to plead guilty"—thus the Rev. A. Lawrence Berry, who has just been ousted from his first pulpit, at West Brook, Connecticut, for "radicalism." Graduated from the Yale Divinity School in June, Mr. Berry soon discovered that his Congregationalist employers did not come to church to hear about the "downtrodden masses" or of the "oppression of the poor by the rich and the afflictions brought upon the country by the millionaires." The idea! Why could he not have known that people go to church to be soothed and not to be stirred, so that they may go ahead comfortably in their own righteousness, in their duty well done, and not be vexed on the Sabbath by being told about the bad plight of others or to hear the rich denounced as malefactors. Couldn't Mr. Berry have realized that most of the churches of today are like this? That members no more wish to be ill at ease than did their prototypes when the Upstart of Galilee began to make good people uncomfortable? We suggest that Congressman Fish call his committee together at once to investigate this case and see just how many young radicals like this are being turned out of the Yale Divinity School. Pray how could this school have come into being—and how could Yale University survive—were it not for the rich, the godly, and the church-going?

OUT OF PERHAPS 300,000 manuscripts and foreign books submitted to American publishers every year, according to John Macrae, Jr., of the publishing firm of E. P. Dutton and Company, only about 10,000 are published. And out of those 10,000 only about one in fifty survives more than two years. One may draw whatever moral from this one pleases. Considering the appallingly low quality of the average book that is actually published, it leaves one to speculate, on the assumption that the judgment of publishers is reasonably good, on how unspeakably bad must be the average manuscript. And that only one in fifty of the published books reveals any survival powers may indicate statistically how bad are the other forty-nine books—or it may indicate something about readers. After all, even one in fifty means two hundred more books a year added to the cultural load on posterity's back; posterity must keep jettisoning and forgetting the poorest in sheer self-defense. Thus even if the average quality of the books were two or ten times as high as it is, we should have to get rid of all but the best. Mr. Macrae announces that his own firm is going to try the experiment of republishing books that have already been out five years or more and for which a quiet demand still exists. It is a good experiment. Why should we have to read new and mediocre biographies of Voltaire, Goethe, Beethoven, Lincoln, and Napoleon every year, for example, when better old biographies exist?

Cuba Revolts Again

PERHAPS never in modern history was there a country so sorely in need of a wise and sound revolution as is Cuba today. Its people are hungry, its domestic economy is near the breaking point. But more significant than these, it is saddled with an absolutely ruthless dictatorship, with the iron and bloody rule of a personally ambitious man, which, more than anything else, has brought Cuba to its present miserable estate, for General Gerardo Machado y Morales has been complete dictator. With the help of his well-fed army, of which he now boasts while the peasants starve, he managed for years to suppress all military and revolutionary opposition. Through his control of the police he stamped out labor and liberal opposition; the murder of more than one labor leader and liberal editor has been traced directly to the doorstep of his police administration. By skilful manipulation of the state lottery he kept the politicians silent and the three political parties unanimously obedient to his every whim and wish; they rewrote the constitution at his command and reelected him to office despite his pledge that he would not seek a second term. These things Machado could not have done without financial assistance, and to obtain that very necessary help he, the chief of a supposedly independent state, more than once degraded himself to the point of licking the boots of New York bankers. Some of them responded with American dollars, more than a billion of which are now "invested" in Cuba. In consequence a few American bankers and investors have at times profited, the Machado dictatorship has waxed fat, while poverty was slowly spreading among the Cuban people.

It is this tremendous poverty, due in large part to the sugar situation, which has led to the present attempt to overthrow Machado's dictatorial rule. If the Menocal-Mendieta insurrection fails, because of the capture of its leaders or for some other reason, it is almost certain there will be other uprisings in the future, for the Cuban situation will remain intolerable until Machado is deposed. We earnestly wish that Cuba could have a genuine revolution. We no less than the Cuban National Confederation of Labor want to see a real democracy established there. But, unhappily, the weakness of the labor and liberal movements strongly suggests that the time has not yet come for a lasting democratic revolution. For the time being at least the insurrections will be led by military men. Hence the presidency will doubtless fall, should Machado be gotten rid of, to a political general, or some one like General Mario Menocal. We certainly cannot be counted among those who believe in government by political generals, but we nevertheless feel that any new government in Cuba could only be a distinct improvement over the harsh rule of Machado. This would have been especially true of former President Menocal, if we may judge by his past record and by the present program of his party, but fate was against him.

But while studying the developments in Cuba, it is important to bear in mind that the news from Washington also needs watching. Already there is talk of intervention. Senator Walsh of Massachusetts has demanded that the United States "order" the Cubans "to put their house in order and conduct their government decently, honestly and

fairly." Other persons are discussing our "obligations" under the Platt Amendment, and still others are pointing to the precedents for armed intervention established by Roosevelt, Taft, and Wilson. The State Department has denied that it is thinking in terms of intervention. So far so good. But we wish the Department would declare flatly and unequivocally that the United States will not intervene. It should make it clear to the people of this country that the rebellion against Machado is purely and simply a domestic affair of the Cubans. Washington is here not merely concerned with the question of justice for a small nation, which in itself should be sufficient to persuade the United States to keep its military forces out of Cuba, but with the friendship of all the rest of Latin America. Mr. Hoover has shown upon several occasions that he counts upon this friendship to improve trade relations with our neighbors to the south. Armed intervention in Nicaragua four years ago aroused the whole of Central and South America against us. Any suspicion that we are even as much as contemplating similar action in Cuba may bring another and perhaps a worse storm. The State Department should make its position clear. It should declare that it will not intervene in any revolt of the Cubans against their monstrous dictator.

Destroy and Prosper

THE United States Department of Agriculture has estimated that the 1931 cotton crop will reach 15,584,000 bales, 1,652,000 bales larger than the 1930 crop, and about 1,500,000 bales larger than the average of previous private estimates. Cotton has collapsed to around 7 cents a pound, the lowest price in the last twenty-five years, and the Federal Farm Board has made the amazing proposal to the Governors of fourteen cotton-producing States that they "induce immediate plowing under of every third row of cotton now growing." Fortunately, at least half of the Governors to whom the Farm Board telegraphed had the courage and good sense to reject its proposal instantly.

That it would have been possible to carry out such a plan even with the maximum of official cooperation and pressure is extremely doubtful. For the plan to succeed as the Farm Board intends, it would be necessary not only for each State voluntarily to destroy the same proportional amount of cotton as all the others, but for each individual cotton planter to do so. It is doubtful if such a plan could be carried out even by martial law. For just as it is to each individual State's interest to secure a maximum production of cotton itself and have all the rest cut down, so it is to each individual planter's interest to secure a maximum production while every other planter plows under part of his yield.

Even conceding that it were possible to put such a plan into effect it would be little short of criminal. This does not mean that the members of the Farm Board who suggested the plan had themselves any criminal intent; they are merely well-intentioned men whose economic beliefs are simple, naive, and tragically muddle-headed. Why is cotton down? Because there is an over-supply. Therefore we need simply destroy the surplus, and everything will be well.

That is the essence of the Farm Board's economics. But if it works for cotton, it should work for everything else. It is not merely cotton that is down, but nearly all basic agricultural staples and raw materials. Wheat, copper, silver, oil, rubber, coffee, sugar are all at prices lower than the world has seen in years. Therefore let the nations of the world take hundreds of millions of bushels of wheat, thousands of tons of sugar, rubber, and copper, and millions of barrels of oil and dump them all into the sea. Then prices will go up, prosperity will return with a rush, we shall all be jubilant and a Republican victory will be assured.

Surely even the Farm Board might begin to suspect a slight flaw in this logic. Even Mr. Hoover, who through his silence had given at least his tacit approval to the Farm Board's suggestion, might begin to suspect it. Indeed, when he was Secretary of Commerce, and when it was other countries that were carrying out analogous schemes, Mr. Hoover saw the flaw very clearly. No one was more eloquent than he in exposing the iniquity of the Stevenson rubber restriction plan carried out under the aegis of Great Britain; no one objected more strenuously than he to the coffee valorization plan of Brazil. No one would be more prompt now to condemn any other nation which deliberately sought to destroy a part of some basic commodity that we import. Indeed, it is almost safe to say that if any other group of producers in the country were to enter into an agreement now that each member of the group should deliberately destroy a proportional part of his stocks, Mr. Hoover's Department of Justice would instantly prosecute such a group for a flagrant violation of the Sherman Anti-Trust Act.

Overlooking individuals, what lies behind the suggestion of the Farm Board, as we have said, is the naive and appallingly widespread belief that the present world crisis is the result of a general "over-production." That this belief should exist in a period when there is probably more want and distress in the world than in a generation is amazing. Are the American people, who are at least better off on the whole than any other, too-well clothed, too-well fed, too-well housed? The question answers itself. The present crisis is the result, not of a general overproduction, but ultimately of an unbalanced production, and more immediately of a collapse in demand, a collapse in purchasing power, a collapse in methods of distribution. The way out is not to destroy supply, but to restore demand. Two moves in that direction would help the cotton growers immediately, as they would help every other producer: the restoration of the chief sore spot, Germany, to economic health, and the reduction of tariffs, particularly our own. Only by selling us imports can foreign nations secure the purchasing power to take our exports.

Meanwhile we may regard the immediate situation in cotton more calmly. A 15,584,000 bale cotton crop would be large, but it would not be record-breaking: there were larger crops in 1925 and 1926, when cotton was at a much higher level. It is true that we have a record-breaking carry-over, but that again is the result of collapsed demand, not of record-breaking crops. The Government's August cotton crop estimates, moreover, have been badly mistaken in the past, and can be again. Perhaps the weather and the boll-weevil between them will do more to reduce the crop in the next few months than the Farm Board and all the Southern Governors could possibly do.

Mr. Hoover Wobbles on the Dole

THE President begins to weaken in his attitude toward unemployment relief—of that there can be no doubt. Almost immediately following Senator Couzens's demand for an immediate extra session of Congress and Federal aid for the starving, Senator Fess, Chairman of the Republican National Committee, announced, after a long interview with the President, that Mr. Hoover would have a "concrete program for relief of the unemployment situation when Congress meets." The President, it appears, is making "a most thorough study of the unemployment situation" (*another study!*); he has "set all agencies of the government at work to ascertain the actual situation," and "within a month" will know "exactly what will be required of the government next winter,"—this a week after his announcing that the Government's function could only be that of a coordinator of all relief agencies. Both the President and Senator Fess are still opposed to an extra session, but the Federal Government "must and will" take decisive steps to prevent starvation next winter. Indeed, the Senator opines that, with the prospect of a vast over-supply of foodstuffs next winter, it would be "unthinkable" for the Government to stand idly by while hundreds of thousands starved.

Precisely. That is exactly what the many individuals, organizations, and journals with *The Nation's* point of view on this question, have been saying for months past. Now that Mr. Hoover has come to this position there can be little doubt that if he really obtains and faces the facts, he will see that there will be no possibility of succoring the needy except by grants from the Federal Treasury. We are aware that both he and Mr. Fess are still "unalterably opposed" to the dole—but then he was always unalterably opposed to anything like a moratorium to Europe; it is never astonishing in a Presidential year to find a candidate altering "unalterably opposed" into "alterably opposed." What are two letters of the alphabet to a politician? We have read, too, of Mr. Hoover's rejoicing because the directors of 227 community chests or councils have reported to Washington their "complete confidence" that they will be able "wholly" to undertake the burden of local relief. Before we can share Mr. Hoover's happiness we should like to know something about these 227 communities. Are they large or small? Upon what do they base their "complete confidence"? What does the word "wholly" mean? And how can they tell now what will be the unemployment in their communities in December? Mr. Hoover admits it is worse.

We are the less impressed by the report of the 227 community chests because there lies before us the June Relief Bulletin of the Russell Sage Foundation. "Outdoor relief expenditures in the larger cities," it reads, "which rose to an unprecedented height at the end of the past winter and declined in both April and May, underwent further decline in June. In part the reduction has been due to normal seasonal contraction of relief operations, but there is evidence that *depletion of special emergency funds* accounts for much of the decline." Mr. Hoover is trusting, indeed, if he believes that private charity will everywhere be able to repeat next winter what it did last, and then be

able to add sufficient to carry all the additional unemployed. Take Chicago and Philadelphia, for example. In June, available relief expenditures were less than one-third of those in May, and *less than one-fifth of those in March*. Will any sane person contend that there was only one-fifth of the suffering in July that there was in March?

We have deliberately used the phrase in regard to Mr. Hoover "if he faces the facts," because he is steadily refusing to do so. How else can one view his giving to the Washington correspondents with his own hands the absolutely misleading statement issued by Secretary Doak on August 4? As he handed it out Mr. Hoover declared that the reorganized Federal Employment Service "shows a large measure of accomplishment." The headlines the next day announced that a total of 638,689 people had been provided with jobs by the Government "cooperative employment service." The correspondents were amazed by this great success—until they came to analyze it. Then what did they find? Why, that the Federal Employment Service had placed only 281,769 persons in jobs between April 1 and July 31, and that of those placed in jobs probably 95 per cent were farm laborers! More than that, the President and his worthy Secretary of Labor forgot to add that in the same period of 1928, when there was no crisis, the Federal Employment Service placed no less than 559,000 farm workers, or at least 250,000 more! Moreover it now appears that despite this 1931 record employment was off two per cent in July and wages 4.8 per cent from June.

But this was only part of the flim-flam worked upon the correspondents by the President. A further examination of the facts shows that the "cooperative employment service," credit for whose work Mr. Hoover and Mr. Doak annex so glibly, consists of the employment agencies of the several States, many of them long established, which would have functioned even if the Federal Government had never moved. Now, the only connection between the Federal Government and these agencies which lends a shadow of justification to Mr. Hoover's claim of a federal achievement, is the fact that a number of "State directors," chiefly jobless labor friends of Mr. Doak, have been constituted liaison officers, without even an office force to enable them to achieve something. They are today doing nothing but getting in the way of State officials, patting them on the back if the spirit moves, and forwarding information to the Department of Labor. On the basis of these tenuous performances and the arduous effort involved in totalling up the achievements of the States, the President actually tried to assume at least partial credit for the 356,920 persons whose jobs are *entirely* due to the States. Was there ever such colossal impudence?

We believe that the President's wobbling and shuffling will go on until he finally takes the only possible course to keep numbers of American citizens from utter starvation. It is quite significant that Governor Pinchot of Pennsylvania demanded in Detroit on August 13, that there be immediate planning "for relief by the only agency that *can* complete the job, and that is Uncle Sam." Americans shall not die for lack of food in the midst of plenty.

Speaking of Revolution . . .

By HENDRIK WILLEM VAN LOON

MONSIEUR ETIENNE DE SILHOUETTE had a bright idea. He would coin a new phrase and fashionable society would take it up and all would be well with the world.

Monsieur Etienne de Silhouette was in a very difficult position. Fashionable society had called upon him in its hour of

need. Fashionable society was going broke. It was going broke so fast and so thoroughly that fashionable society had noticed it, and when fashionable society notices anything at all, it is time for the world to sit up and take notice.

The world sat up and took notice while Monsieur Etienne de Silhouette put on his best pair of blue clocked silk stockings to give notice to His Majesty the King that he was willing to accept the dignity which His Majesty's mistress had so kindly bestowed upon him.

When he drove back to Paris, a great sigh of relief went up among the card-tables of Versailles and snuff-boxes moved gaily from hand to hand. Pompadour was almost civil to France. (What sublime gall! "France, come here! France, bring me my knitting!" and the descendant of Holy Louis actually ran and fetched!) And everybody was happy.

Except Monsieur de Silhouette. For he was a stern man and an honest man, but he had no sense of humor and so he had believed what the King and the Pompadour had told him—that it was up to him to save the French Monarchy from bankruptcy.

Silhouette, a Ledger on Legs, studied the budget of the Kingdom as he had studied the returns of his subordinates when he was collector of internal revenue. He quickly detected the leak and reported to His Majesty that he knew the remedy. His Majesty bade him go ahead.

Silhouette went ahead. If the country was to be thrifty, why not begin right at home? And why not teach thrift to the little playmates of His Majesty, who could afford it better than the peasantry on their estates?

A new slogan was invented: "It is smart to be thrifty." A new law was passed, cutting all royal pensions in half, and another law threatening to tax the land of the nobility. Then, as a final gesture of thrift, "Would their Royal Highnesses and their Serene Highnesses and their just plain, ordinary Highnesses kindly sell their extra plate to help the State get a little cash?"

It was the greatest joke ever perpetrated upon the French people. Thriving through thrift! The country went Silhouette-mad. People gave Silhouette dinners where they served nothing but dry bread and drier water. The black and white artists who patronized the country fairs and who would cut you a "spitting image" of yourself for one hundredth the price of an oil painting, called their cheap

little portraits Silhouette pictures. "Don't forget, Ladies and Gentlemen, it is smart to be thrifty! Have your thrift picture taken! Have your Silhouette picture taken!"

Silhouette, the honest but dumb financier, who thought he could save his nation by preaching that thrift like charity began in the parlor, lasted exactly eight months. Then he was allowed to retire to his country-place, where he spent the remaining few years of his life going to mass and writing a number of very dull volumes on subjects of a vaguely philosophical nature.

But seventy years after his death he enjoyed a short moment of posthumous glory. The covers of the Dictionary of the Academy were opened wide to receive a distinguished newcomer. The word "silhouette" was officially admitted as an active member of the French language. It meant "the portrait of a person in profile, showing only the outline!"

So much for the first great hero of smartish thrift and thrifty smartness. If you ever drive through Brie-sur-Marne, you may still see where he lies buried. But you won't notice any monument.

There exists an amiable notion that history teaches nothing and that therefore the hours spent upon historical studies are so much waste of time. Or as Henry of Dearborn expressed himself so eloquently, "History is bunk." He was right, but he might just as well have argued that the tables of multiplication teach nothing. It merely depends

on how you use them. Perhaps history teaches too much.

The financial wonder-man of Louis XV has been completely overlooked by the biography-distillers of the last decade. Surely he deserved the obligatory 350 pages (frontispiece and twelve illustrations, \$3 net) and he deserved them a great deal more than many of the other recipients of these post-sepulchral honors. For he was one of the most illuminating object lessons of the recent past. He honestly tried to save France by a thrift-campaign among the wealthier classes. They in turn called him a parsimonious prig and a muddle-headed meddler and hired every cartoonist in Paris to lampoon their enemy out of existence. Then they went back to their little dinner-parties and to their beloved backgammon.

Backgammon remained all the rage. Some of His Majesty's attendants by the next reign got to be quite good at the game. It is a pity that the most brilliant party was never finished. Just before the last throw of the dice, the players had their heads cut off.

Monsieur Sanson tried to finish it with his assistant. But the boy was nervous and upset the table. He tried to excuse himself. "Sh," said the amiable executioner. "I know all about it. We had a very busy and tiring day."

President Hoover's Record

X. Hoover as Individualist

By WILLIAM HARD

MR. HOOVER entered the Presidency as a professed economic individualist—amid widespread approval and applause. In the circumstances created—or, rather, revealed—by the depression he has declined to proceed to any deliberate drastic open revision of his individualistic philosophy. He is charged now with lack of leadership. His dilemma is—and, indeed, long has been—that the only practicable, the only thinkable, leadership seems to be in the collectivist direction.

He shares this dilemma with most of the rest of our statesmen. Senator Borah, for instance, denounces "bureaus." He denounces the inevitable organs of the apparently irresistible collectivist advance. He denounces them; and from time to time in the Senate he reluctantly but repeatedly votes to bring some more of them into existence. He illustrates vividly our basic contemporary American paradox.

We are individualistic in thought, ingrowingly. We are collectivistic in action, expandingly.

I am obliged to look upon this paradox as forgivable. I am not unconscious of having myself contributed some few small notes to the alarms that have been rung against bureaucracy, while simultaneously contributing some few small bricks to the building of the bureaucratic edifice. I am unable (though it would be pleasant) to view the behavior of Mr. Borah and of Mr. Hoover in this matter with superciliousness.

It is only in association with the circumstances of the depression that I have begun belatedly to reflect that there must be a frailty somewhere in a philosophic system which expresses itself continuously toward one end in aspirational oratory and continuously toward the precisely opposite end in ultimate achieved conduct. Not being in public office, I can indulge myself in such reflections with a superior immunity.

Mr. Hoover's individualistic thesis is that there should be a recoil from governmentalism, and especially from federal governmentalism, and—more generally—from all collectivism sustained by governmentalism.

Let us observe that recoil in action.

An aggravated and extremely expensive instance of federal governmentalism has long existed in our federal subsidies to local highways and to local waterways.

Mr. Hoover, in his first regular report to the Congress on the state of the Union, in 1929, recommended a serious consideration of the advisability of enlarging the subsidies to local highways. He simultaneously recommended outrightly an enlargement of the subsidies to local waterways.

The railroads were naturally resentful. Better highways mean more trucks and buses, and better waterways mean more tugs and barges. The railroads relied on the incessant singing of the individualistic theme-song: "The Government should not compete—or facilitate competition—with its citizens and tax-payers." They relied in vain.

The Administration has steadily pursued an advocacy of increasing federal assistance to highway and waterway developments.

Helpful to trucks and buses and to tugs and barges, the Administration has been even more directly helpful to airplanes and to ocean-ships. The federal subsidies to airplane development are accomplished through frank overpayments for the carriage of the mails. The subsidies to ocean-ship development are accomplished both by that method and by the method of construction-loans out of the Federal Treasury at non-commercially low rates of interest. Mr. Hoover has not striven to curtail these subsidies. He has striven—and successfully—to expand them.

Nor has he hesitated to invent at least two new species of federal subsidy.

He has advocated appropriations by the Federal Government for assistance to local county health units through the United States Public Health Service.

He has offered to deprive the Federal Treasury, during this current fiscal year, and during the next ensuing fiscal year, and (in part) during nine fiscal years thereafter, of some \$250,000,000 due to it from European Governments in order, as he has said, "to help free the recuperative forces already in motion in the United States from retarding influences from abroad." The "retarding influence" instantly imminent was the potential incapacity of Germany to meet its obligations to American investors and depositors in German governmental and industrial and financial institutions. The "Hoover Moratorium" had its internationalistic aroma. It also had its economic anatomy. In that latter aspect it was nothing but an indirect preventive federal subsidy to the foreign-investment element in our population.

So much for subsidies. Now for regulation.

How many regulatory "fettters" have been struck from the limbs of the American business community under Mr. Hoover? Of course, none. The Republican Party must be credited with one stupendous betrayal of our Chambers of Commerce. It orates to them every four years against "bureaus"—and then, in office, rivets a few more bureaus upon them.

Under Mr. Hoover the perfectly permanent character of the bureau for the allocating and policing of the waves of the ether has become assured. Whatever dreams Mr. Hoover may have had, as Secretary of Commerce, of a "self-governing radio industry" have been dissipated in presidential awakening. The Federal Radio Commission is now an accepted fixture in our federal bureaucratic display.

We also, with Mr. Hoover's complicity, and by act of June 10, 1930, have now a new bureaucratic bourgeoisie in the field of agricultural perishable products. The inter-state traders in such products must now be licensed by the Department of Agriculture. They must be careful not to provoke the Secretary of Agriculture by oppressive practices into rescinding their licenses. They must meditate upon a

higher and nobler individualism than that of unrestrained free will.

So must the operators of inter-state buses. Mr. Hoover says so. "The bus regulation measure," he remarked to the Congress last year, "should be completed."

He similarly—but much more importantly—has asked the Congress to impose more regulation upon the operators of electric power companies. There has been irony in the reception of that request.

Almost two years ago Mr. Hoover said to the Congress:

"It is desirable that the authority of the Federal Power Commission should be extended to certain phases of power regulation." . . .

The invitation thus conveyed by the President to the Congress was at any rate an opening. Through it a progressive Senate could have rushed to drive a larger coach, hauled by more and bigger horses, than the President perhaps wished. The irony is that the Senate has been so preoccupied with battling the power interests at Muscle Shoals that it has had virtually no strength left with which to battle them through competent and effective federal regulation of them in all their inter-state activities and aspects throughout the country. The Senate bill for the quelling of power companies federally in the whole inter-state arena is still in the chrysalis stage. The President is able on this point to regard himself—if he so chooses—as a pioneering collectivistic regulator far in the van of progressive actual action.

We then approach, after federal regulation, federal ownership and operation.

The federal departments manufacturing commodities for their own use or for the use of other departments continue to manufacture them.

The Department of Commerce, for instance, through its Bureau of Mines, continues to manufacture helium for the Navy Department. In the course of the last twenty-four months the President's Budget Bureau has secured some \$400,000 from the Congress for enlarging the helium plants whereby the Bureau of Mines has virtually extinguished the commercial future of the country's private helium industry. Senator Norris could not do much more.

On western waterways, deepened to navigability by federal finance, the federally owned and operated tugs and barges of the War Department's Inland Waterways Corporation are still engaged, as the Secretary of War puts it, "in demonstrating that the development of our waterways is a sound business undertaking that promises cheaper freight rates for the people whose taxes have paid for their improvement."

At Muscle Shoals Mr. Hoover has fought the proponents of public operation with results which constitute a stand-still. At Boulder Dam he has helped to accomplish results which constitute motion—and which constitute also an acceptance of much public participation in the project.

The power plant at Boulder Dam—now Hoover Dam—will be operated jointly by a local private enterprise and a local public authority. The power produced will go in part to the local private enterprise but in much larger part to local public authorities in various guises. Back of them the original financing of the whole Hoover Dam effort will have been achieved—not in times of war, as in the instance of Muscle Shoals, but in times of peace!—by a Federal

Government beneficently interested in cheap water and cheap power for its children of the Far Southwest.

If this mixed outcome gives little satisfaction to our fiercer "forward-lookers," it gives less to our languishing laudators of times gone by.

I now arrive, however, at a development which far transcends the meager limits which must be assigned in this country at this time to public ownership and operation as a political prospect. I allude to certain prospective diminutions of individualistic competition between privately owned and operated business units.

What has been Mr. Hoover's attitude in relation to this problem? It has not been toward the multiplying of competitive massacres. It has been toward the mitigating of them.

Mr. Hoover has not urged more railroad units and more struggle between them for the partition of revenue. He has urged railroad consolidations.

He has not urged more banks. He has urged congressional consideration of more bank branches and more bank chains—under, of course, proper public surveillance.

He has given a sanction of non-interference to the Chadbourne sugar scheme. That scheme involves restraints upon sugar exports by many countries. It involves restraints upon sugar plantings as well as upon sugar exports by Cuba, our international sugar ward. It involves extensive financial operations by the Cuban governmental treasury, toward which we have a frequently proclaimed solemn international responsibility. The Chadbourne sugar scheme, as a total, is undoubtedly all time's farthest reach toward a governmentally sustained international capitalistic collectivism. It draws from the Hoover Administration a full tacit consent.

In the meantime, within our national confines, our Federal Farm Board, advocated and initiated by Mr. Hoover, has flown a flag not altogether dissimilar to Mr. Chadbourne's.

I realize that some farmers are hostile to the Federal Farm Board because it manifestly cannot cure the whole world of a worldwide instant depression of prices. They are against the Board for what it is unable to do. I am more impressed by the gentlemen who are against the Board for what it does do.

It finances collective groups of farmers—called co-operatives—to get business which otherwise would go to individualistic private traders. These traders in Chicago have formed a militant society to exterminate the Federal Farm Board. In Philadelphia their grief has aroused Senator David A. Reed to declare that in the next session of the Congress he will move to wipe the Board off the statute-books.

I cannot believe that a grief so profound is caused by a Board which is no menace to individualism as we have known it. The Board is in truth a devastating menace to that individualism in the agricultural products marketing industry. It embodies a principle which could in time pave the whole route from harvest-field to retail-store with co-operatives in place of individualistic competitive enterprises.

In the wake of the administrative energies of the Federal Farm Board we observe the statistical and moral energies of the Federal Oil Conservation Board.

Oil men of the West wish to curtail their disastrously

excessive oil output by collective "allocation" and by collective "proration." They cannot do so without incurring a possible visitation from the Department of Justice. The Department of Justice represents individualistic law. The Federal Oil Conservation Board represents collectivistic economic equity. It proceeds to appoint a committee which proceeds to publish statistics "allocating" to each oil state its sensible quota of production. It proceeds of its own motion to advise the oil States to enter, among themselves, into an "inter-state compact" under which they may be able to restrict themselves to their "allocations" and to "prorate" those allocations among their individual producers.

In other words, the Federal Oil Conservation Board proposes to organize the oil production of the United States on a collectively controlled basis through the statistical and moral intervention of the Federal Government and through the coercive intervention of the oil-State local governments.

If Mr. Chadbourne could give his time to it, this oil project would appropriately crown his sugar project.

And now the Federal Timber Conservation Board is beginning to emulate the Federal Oil Conservation Board's adventures. It, too, has started to publish committee reports on expected consumption and on suitable output. It, too, has started to adumbrate the coming eclipse of economic soloists by economic orchestras.

Wholly consistently, Mr. Hoover has suggested to the Congress that in respect of the bituminous coal industry there should be a legislative pondering upon the question whether or not a strict complete retention of the statutes against co-operative control of output is now wise. Some operators have responded by suggesting that the Federal Government should supervise the co-operative control undertaken.

Those operators are clear-sighted. They know very well that governmental sanction to private co-operative control implies, as a corollary, governmental direct or indirect protection of the consumer.

Mr. Hoover, in his tacit or expressed patronage of all these steps toward a checking of ruthless and ruinous individualism in privately owned and operated industries, has been both a collectivist and, in ultimate inevitable outcome, a governmentalistic collectivist.

I have now spoken of Mr. Hoover's attitude toward federal subsidies, toward federal regulation, toward federal ownership and operation, toward federal assistance to co-operative endeavors in private business. Throughout he has exhibited a collectivistic tinge. Throughout, whenever any positive new move can be attributed to him, it has been toward the collectivistic end of the economic spectrum.

What I could willingly imagine now would be a Mr. Hoover stepping buoyantly to a microphone and saying:

"Fellow-countrymen:

"The depression has waked up a lot of people. I want to tell you that it can even wake up Presidents.

"I have been preaching a dogma—and breaching it. This has been very confusing to you. It has also been very confusing to me.

"I have now destroyed the plates of my book on *American Individualism*. I wish to announce that I am now an individualist in chief principle but a strong collectivist in supplementary practice.

"I perceive now that some considerable collectivism is

needed in order to make a core of individualism survive and thrive. I not only perceive this, but I shall say it.

"Along with most of my critics I have been philosophizing the past and backing into the future. I thus have seemed often to be irresolute and inconsistent.

"I have advocated great subsidies to ship-constructors and have been frightened by smaller ones to crop-growers in drought regions.

"I have advocated federal financial assistance to local health units and have been scandalized by suggested federal financial assistance to local employment exchanges.

"I have gone farther than any of my predecessors in the White House toward advocating public works as alternatives to private pay-rolls in depressions but have hesitated to pursue that novelty to the gigantic scope required by the situation.

"I have been the very first President to cause the Federal Government to express a vigorous opinion in favor of the maintenance of private hourly and weekly wage-levels for the employed during depressions, but I have shied away from the parallel innovation of causing the Federal Government to exert a vigorous pressure toward the formation of private wage-insurance funds to be expended for the unemployed during depressions.

"Exactly like the journalist who has implored me to make this speech, I have sinned greatly against a coherent acceptance of economic fate.

"My fault! My fault! My grievous fault!

"You never before saw a lapse by a President from the doctrine of presidential infallibility, but you see one now.

"I shall now cease to philosophize only the past and shall strive also to philosophize the future.

"Watch me, and you will be surprised to see how much better I shall go when I go into the future face forward."

So I imagine him broadcasting, and it takes almost as much imagination on my part as it would take audacity on his.

It all, in any case, is only a perhaps reprehensibly frivolous way of trying to express two concluding contentions:

One. Whether illustrated by reactionaries who are against unemployment insurance because they would rather see the unemployed man die exclaiming "I die to preserve individualism," or illustrated by radicals who are against chain stores because they think that there ought to be as many separate individual managements as there are stores in this whole country, our dominant thought in Washington is a brake upon our national progress instead of an engine of propulsion for it.

Two. We greatly need in our national public life a political philosopher who, without surrendering his hold upon the tenable advantages of individualism, can nevertheless specifically survey and comprehensively declare the points of desirable occupancy in the new American collectivistic frontier.

I think that only such a philosopher could in 1932 strive for the Presidency against Mr. Hoover on terms that would make the contest anything more than a possible exchange of one President whom we charge with "lack of leadership" for another President whom we would then equally unconstructively but equally discontentedly charge all over again with "lack of leadership."

Vanzetti and the Quest for Truth

By GARDNER JACKSON

IT may seem fantastic and, therefore, quite unconvincing to compare the words of Bartolomeo Vanzetti, executed as a murderer by the Commonwealth of Massachusetts just four years ago (August 23, 1927), and those of Herbert Hoover, President of the United States. Nevertheless, so striking is the contrast that the comparison is inevitable to anyone familiar with the utterances of both.

Vanzetti was writing from his prison cell in Charlestown Prison, Mass., after more than six years' incarceration. President Hoover was writing from the White House after a year and a half of occupancy. Vanzetti was writing to Alice Stone Blackwell of Boston whom he addressed as "Dear Comrade Blackwell." President Hoover was writing to President-emeritus W. O. Thompson of Ohio State University, whom he addressed as "My dear President Thompson."

President Hoover wrote (under date of Dec. 30, 1929): "You aptly penetrate the vital question of public action—the discovery and promulgation of truth. . . . We can and must . . . greatly increase the production of truth . . . the grave interest of 120,000,000 people is involved in government policies. . . . The truth is hard to discover; it must be distilled through the common judgment of skilled men and women from accurately and patiently collected facts and knowledge of forces before the extraction of the essence of wisdom. The materials themselves are hard to come by; it takes time and patience. . . . So you will know why . . . more and more temporary committees, commissions, conferences, researches—that they are not for executive action (for which they are anathema) but are one of the sound processes for the search, production, and distribution of truth."

Vanzetti, not yet even imagining an Advisory Committee headed by the President of Harvard University to investigate his and Sacco's predicament, wrote (under date of Nov. 12, 1926): "It is now customary to speak of objectiveness—as of a great thing. Relatively understood, it is a good thing, absolutely it is trash. A human being can perceive, understand, judge from and with his being and he can only be objective according to the very nature of his being, in respect to each and all the questions and problems of life. Nothing is worse than a false belief of self-goodness or greatness. It is that which permitted Nero to kill his mother without remorse. . . . The convinced of the most bad belief may wrong everything and everyone, convinced to be objective."

"Therefore, I will only try to be just and honest to each of my topics—this is the only possible and real objectiveness. Yet, if I will treat anything in a wrong erroneous way, by ignorance, I will be unjust and dishonest, *che fatto*, in spite of all my good will. The truth, then, is what matters. But in this regard, too, alas to one who is too sure of possessing it, especially if more than relatively absolutely. . . ."

President Hoover from the White House was informing his friend that the attacks on his administration were

merely in the nature of harassments against the crusade for truth. Vanzetti from his prison block was telling his gentle New England spinster comrade (unknown to him virtually except by correspondence) that he could only try to be honest, never claiming infallibility for himself or his friends.

The contrast is surely not far-fetched—the long-time prisoner approaching electrocution with searchings of his mind and conscience for the facts, and the President of the United States using the phrase, "hair shirt," in his letter to Dr. Thompson as a protest against the bringing of "objectiveness" to bear upon his own administration.

So, we cannot escape considering the works of the President's commissions in the digging for truth. And, naturally, the first of President Hoover's commissions to command attention is the Wickersham Commission. How fared that body of America's best minds in the definitions provided by Vanzetti and President Hoover?

As a newspaper man in Washington of quite recent residence I must confess to deep disgust at some aspects of the Wickersham Commission work. To consider the case of Sacco and Vanzetti alone, it would seem reasonable to expect that a gathering of minds such as made up the Wickersham body would go to the record of that seven-and-a-half-year case for evidence concerning the administration of justice in America. Yet all that appears in any of the reports is a veiled reference to it in the report on unfair prosecutions submitted by Professor Zechariah Chafee, Jr., of the Harvard Law School. For the rest, this country appears not to have had a world-troubling Sacco-Vanzetti case so far as the two years of study by the Commissioners and their experts show.

Not that any reference by the Wickersham Commission to the Sacco-Vanzetti case would help to pacify the souls of the two Italians, but simply that this finest group of minds was ostensibly seeking the truth of law administration in this country without regard to policy.

Granted that a number of the reports issued by the Wickersham Commission were of utter integrity—such, for example, as Reuben Oppenheimer's scholarly and devastating study of the United States deportation practices, or Dr. Miriam Van Waters's analysis of the treatment of juvenile delinquents in this country, or Dr. Frank Tannenbaum's account of prison conditions in America—the vital and terribly depressing fact is that this group of America's choicest minds was willing to sacrifice truth for policy in instances where policy was acute. Consider, in this connection, the suppression by the Commission of the 600-page report on the Mooney-Billings case turned in by Walter H. Pollak and Carl Stern to the Commission sub-committee on legal lawlessness headed by Judge William S. Kenyon. Here was the arduous work of experts hired by the Commission and paid for out of the taxpayers's pocketbooks simply pigeonholed because the assembly of fact-seeking minds knew what a controversial issue the case was and what hob a report on it would play. The argument that the Commission had no authority to make recommendations in any given case was

entirely beside the point—nobody even suggested that the Commission should recommend disposition of that case. All that was in order, and all that Mr. Pollak and Mr. Stern did, was to study the record of the Mooney-Billings case for evidence of legal lawlessness. That they found plenty is indicated by the 600-page report they made (apparently for oblivion).

No purpose can be served by going on with instances relating to the Wickersham Commission (whose chief sin, as one member, Monte Lemann of New Orleans, has been at pains to point out, was absence of genuine research—search for facts at first hand).

The purpose may be helped by referring briefly to other committees and commissions whose members have discovered that the dispassionate (so far as one can be dispassionate, as Vanzetti says) search and turning up of facts is not what the present administration really wants—nor any other administration within recent years. The President's Emergency Employment Committee is a classic example to all newspaper men in Washington. Hardly a single recom-

mendation made by the aggregation of experts connected with that committee was acted upon favorably by the White House. Yet not one of that committee objected publicly.

The sum and substance of my contrast between Vanzetti in his prison cell and President Hoover in the White House is that Vanzetti was genuinely eager to discover truth and that the execution of him and Sacco was caused by the very attitude which dominates the governmental commissions at crucial points.

There is no question at all, judging by correspondence I have had with various members of various commissions, that the crucial issues are recognized by these members. The issue turns on the "guts" of these commissioners and their experts. The showing thus far in the Hoover Administration is that a pitifully small number of the summoned seekers for facts have the courage to announce what they find and stick by it. As long as this country has a collection of its best minds soft-peddling controversial and unpleasant facts in its presumed honest facing of and search for facts, so long will there be Sacco-Vanzetti and Mooney-Billings cases.

Briand the Unaccountable

By ROBERT DELL

ONE evening nearly a quarter of a century ago, when Clemenceau was Prime Minister for the first time, he was chatting in his private room at the Ministry of the Interior with two or three of his colleagues in the Cabinet, and the conversation turned on two absent Ministers, Barthou and Briand. Clemenceau pronounced himself as follows: "The difference between Barthou and Briand, you see, is this: Barthou has principles—successive principles—and Briand has none at all."

At first sight this may seem a rather surprising judgment, for Briand has had more "successive principles" than Barthou, who has always been a man of the Center, inclining, like all men of the Center, now to the Right, now to the Left, according to circumstances. Briand, on the other hand, has almost boxed the political compass twice over. Starting from the extreme Left as a revolutionary Socialist, he began, soon after his first election to Parliament, moving gradually away from that position, and in less than ten years had become the hope of the Conservatives. In 1900 he was preaching the revolutionary general strike; in 1910 he was suppressing a railway strike by methods of doubtful legality. The workmen of St. Etienne sent him to Parliament in 1902 as an apostle of the class war; ten years later he had become the apostle of the "policy of appeasement," that is, in fact, of the formation of a great Center party excluding the Socialists on one side and the Extreme Right on the other—a fore-runner of Poincaré's "National Block." The attempt failed—no doubt it was premature—but Briand completed the work that Clemenceau had begun of destroying the coalition of the Left and disintegrating the Radical party, which has not fully recovered to this day. He brought to perfection the system of governing by shifting majorities, composed now of one combination of parliamentary groups, now of another.

In 1913 the man who a dozen years before had advo-

cated the general strike in the event of a war introduced the Three-year Service Bill; he boasted of the fact recently in the Chamber. In February, 1917, Briand signed a secret treaty with Russia, without the knowledge of the other Allied Governments, by which France and Russia undertook to support each other's requirements at the Peace Conference whenever it should be held; notably Russia pledged herself to support the permanent separation of the Rhineland from Germany, and France pledged herself to hand over the whole of Poland to the Czar, and to regard the Polish question as one of Russian internal politics. A few months later Briand was trying to make peace by negotiation—it is true that the Russian revolution had occurred in the interval. Since the end of the war he has been moving back towards the Left, and, had circumstances been propitious, he might well have ended where he began—in the Socialist party. But circumstances have compelled him, if he wished to stay in office, to balance himself skilfully on a tight-rope and once more to govern with shifting majorities. Where he is now it would be difficult to say; and it is doubtful whether he knows himself.

Here, one would say, are "successive principles," if you like. Yet Clemenceau, who had not a little psychological insight, was right. It is not a case of successive principles, but of successive tendencies, or rather of conflicting tendencies which successively get the upper hand. Temperamentally, Briand is on the Left. He would gladly have stayed in the Socialist party had the Socialist party allowed him to remain in it and at the same time be a member of an anti-Socialist Cabinet. He would probably have preferred always to govern with a majority of the Left, but it is not his fault that there is not always a majority of the Left to govern with. The important thing is that he should govern, not necessarily out of mere vulgar office-seeking, but rather because he believes it to be in the nature of things.

In some respects Briand resembles Lloyd George—are they not both Bretons?—but there are great differences between them. Both have more perception and understanding than knowledge. Clemenceau's well-known saying is profoundly true: "Poincaré knows everything and understands nothing; Briand knows nothing and understands everything." But Lloyd George knows how to get information and how to use it; Briand does not take the trouble to get it. He leaves other people to do his work. One of his private secretaries said to me years ago: "It is difficult to get Briand to sign a letter, and quite impossible to get him to read one before he signs it." It is doubtful whether Briand could ever have been Foreign Minister had he not always had Philippe Berthelot behind him. And it has more than once been revealed that he left so much in Berthelot's hands that the latter even took action committing the French Government without consulting his nominal chief. That is not at all like Lloyd George. Lloyd George and Briand are both brilliant orators, but Briand is the greater artist of the two. A famous French actor, after listening to one of Briand's speeches in the Chamber, said: "He has filled me with despair. I can't touch him."

But Briand gives the impression that he does not prepare his speeches. One can often see when he is speaking that he is talking to fill up the time while he is thinking what to say next. And he often says things that he certainly would not say had he reflected. A few months ago he told an astonished Chamber that all alliances were incompatible with the Covenant of the League of Nations. The sentence did not appear in the report of his speech in the "Journal Officiel." He is too much influenced by the circumstances of the moment and the atmosphere in which he speaks. In the Senate on March 28, the enthusiastic reception given to a speech attacking his policy led him to take what was undoubtedly a much stronger line about the Austro-German customs union proposal than he had intended to take, to talk in a threatening manner of the military strength of France, and in effect to promise to stop the proposed customs union at any cost.

Briand is a man of brilliant intelligence. But is he really a statesman? He seems to me to live politically from hand to mouth. A statesman may be unprincipled, but he must have political principles of some sort, clear conceptions of what he is aiming at, and long views. Briand throws off brilliant suggestions, but he rarely seems able to work them out. When at Geneva in 1929, he threw out the suggestion of "European Union," it is doubtful whether he had any clear conception of what it involved, and it is certain that it has landed him in an impossible position. When he, or somebody else, had to put his idea in a concrete form, it became, as Paul-Boncour remarked with pleasure and Léon Blum with regret, little more than the Protocol of 1924 refurbished and restricted to Europe. Its only practical result up to now has been the Austro-German proposal, and the secret of Briand's extreme annoyance at that proposal is that he understands this. He is far too intelligent not to recognize that Germany and Austria have stolen his thunder, and are trying to take the first step towards the economic unity that he tried to avoid because he knows that France would be the last country in Europe to accept it.

Briand has had mishaps of this sort before. He calls himself the author of Locarno, but the authors of the

Locarno Treaty were Lord D'Abernon in the first place and Stresemann in the second; and Briand agreed to it only after months of resistance. Briand's friends claim for him part authorship at least of the Kellogg Pact, yet what he proposed was a quasi-alliance between France and the United States, and Kellogg's counter-proposal was a blow that filled Briand and the Quai d'Orsay with consternation. It was American diplomacy that scored on that occasion. Statesmen, if they can help it, do not let themselves in for discomfitures of this sort.

Briand's great mistake during the last five years has been the belief that he is indispensable, which has made him cling to office at all costs. He has been led into that mistake to a great extent by one of his chief failings, that of overrating his power of getting what he wants by "wangling." Undoubtedly he has a remarkable capacity for "wangling" things out of unwilling people; but it is not unlimited. When he was leaving Geneva in September, 1926, after the meeting with Stresemann at Thoiry, somebody on the railway platform said to him, "Poincaré has his eye on you." "Yes," replied Briand, "as the lion has his eye on his tamer." Alas! In a few weeks the tamer was inside the lion. Briand should have resigned when his colleagues in the Poincaré Cabinet turned down the arrangements that he had made with Stresemann at Thoiry. He would have been violently attacked in France and would have been in the shade for some time, but soon or late he would have returned to office with real power. He has gone on making the same mistake by accepting office in successive Nationalist and Conservative Governments in which he has been a sort of hostage. He has had to adapt his policy to that of his colleagues and of the Government majority in the Chamber, and has been used as a screen to conceal from the world the real character and aims of French foreign policy.

It was because he had got himself into an impossible position that he tried to escape from the Quai d'Orsay to the Elysée. How he and his friends could have been so confident as they were that Briand would be elected President of the Republic passes my understanding. My opinion from the first, which I expressed in the *Manchester Guardian*, was that his election was at least very uncertain. Apart from the fact that the electors of the National Assembly always prefer—with some reason—a dignified nonentity to a prominent politician, it seemed to me likely that in a secret ballot Briand would get the votes of no senators and very few deputies outside the Opposition of the Left, whose candidate he really was. It is probable that the large majority of his own colleagues in the Government voted for Doumer, who was bound, as President of the Senate, to poll the great majority of the senators. Briand has now made the crowning mistake, in spite of the advice of most of his best friends, of withdrawing the resignation of the Ministry of Foreign Affairs which he handed in after his defeat in the presidential election. Had he maintained it, he could have become the leader of the Left, and might well have returned to power with a large majority in the Chamber after the general election next April. As it is, he is the prisoner of the Center and the Right, and will be kept in check more than ever. Throughout his political career he has taken the line of least resistance and acted on the maxim "*reculer pour mieux sauter*," often with unsatisfactory results. It may be that this time he will find that the mistake is irreparable.

Well, I Quit My Job at the Dam

By VICTOR CASTLE

[The following letter was written by a worker at Boulder Dam to Fred H. Moore, a Los Angeles attorney.]
Las Vegas, Nevada, August 8.

WELL, the first thing the four of us did when we pulled in to Las Vegas was to find Mr. Wells, the attorney representing the I. W. W. We learned from him that all of the vagrancy cases against them had been dismissed. He told us he had wired you to that effect. Wells was very much amused over the fact that the I. W. W. boys had been charged with vagrancy notwithstanding that they actually had more money on their persons than most of the people coming into Las Vegas. Of course you and I know that the real reason they were arrested was that their attempt to organize the workers was a thorn in the flesh of the "Six Companies." . . .

The life of Las Vegas all centers around the courthouse park, the little stretch of green grass in front of the depot, and the main street, where one finds a solid lineup of gambling houses and drinking joints. Then, of course, there is the unforgettable "skidway," where, for approximately a square block, the flotsam and jetsam are herded together for the purpose of satisfying the sex appetites of the men who are building the Hoover Dam. Many a young worker is going to remember the Hoover Dam, not as a triumph of engineering skill, but as the place where he contracted a venereal disease. Prices here are relatively low, including sex satisfaction. While sitting at a restaurant table we were approached by a girl who advised us that at the "Blue Heaven" and "Ye Bull Pen Inn" and a number of other places, a more choice quality of feminine companionship could be found, younger I suppose, but at a correspondingly higher price. We did not avail ourselves of this privilege. Curiosity did take us down the "skidway" and there women and girls of all kinds and ages vied with each other to attract attention.

There are just two endurable spots in town—the courthouse lawn, and the depot lawn. The City Fathers of Las Vegas are entitled to at least one vote of thanks, for they never turn the water off, and so the grass is constantly sprinkled. Men, women, and children sleep on the lawn at all hours of day and night, and sometimes an exhausted sleeper gets a good soaking. If he is not particular about his wardrobe he welcomes the water as a relief from the heat. Here, in these parks, you can find workers from every section of the United States—lured across the desert by the hope of work. The temperature reached its peak of 120 in the shade around 2.30 p.m. Our first night we slept on the lawn, with hundreds of others, at the courthouse. I say slept out of courtesy; as a fact it was so hot all night we woke up the next morning more exhausted than we were the night before.

The second day the four of us hit the highway again in our car and headed for the dam site. First we drove to Boulder City, which is thirty-two miles from Las Vegas. This city is being built and will be under the immediate

control of the "Six Companies"; it will be the construction center for all the work. Judging superficially, the quarters that will be occupied by the workers, when houses under construction are completed, will not be bad. These buildings reminded me of the barracks which were built at the cantonments. However, it is too early to judge of these places, and at best it will be many months before Boulder City will or can be occupied.

From Boulder City we drove on some four or five miles to Williamsville, better known locally as "Rag City." On a large rock which we passed as we neared the entrance to this section some honest person had painted "HELL HOLE." This is the refuge of men with families who have come seeking employment. There is not a green thing in sight. Here are probably some three to four hundred families living in tents rigged up out of every known kind of wood, rag, and tin from cans. These "homes" are scattered around on bare hillsides, where the only vegetation is dwarfed specimens of cactus and mesquite. All water has to be hauled in from the outside. Las Vegas water is sold at fifteen cents for two gallons, or five gallons for a quarter. Local enterprise has dug a hole in the sand something like a block from the river, where the Colorado (which is Spanish for red, and the river is well-named) River waters seep through. Here is where those who don't (and most of them can't) buy Las Vegas water dip their supply from. The water is almost the color and texture of rich cocoa. "Rag City" boasts no sanitary facilities, other than two old-fashioned out-houses which are patronized by everybody.

We next went to one of the Lewis Construction Camps, known as "Camp B." There I got a job, working in the dining room as a waiter. I went to work about 12.30 p.m. and worked until 7.30 p.m. The following morning I worked from 5.30 a.m. until 2 p.m. For this I got \$2 besides my meals, being allowed fifty cents per meal. Then I quit. I could have got this job for a month at \$60 a month with board and room. The board is good. The "room" consists of a cot with filthy blankets placed in a tent with three other cots. The tent is utterly unprotected by any shade, mercilessly exposed to the sun and without any double roof. I tried to sleep between 7.30, when I quit, and 5.30 when I went to work again, but it was simply impossible—the tent was unbearable. I preferred the outdoors and found a lumber pile where I stretched out. I did not sleep, I dozed, for I was tired but with a temperature which never dropped below 130 during the night sleep was out of the question. By morning I felt burned to a crisp.

As I understand the situation, Anderson Brothers have a contract for the feeding and housing of men with the "Six Companies." They also run the commissary. The men are furnished script books with which they can buy supplies, with the profit going to the Anderson Brothers.

In the mess hall where I worked, four waiters served 350 men. We no sooner got the tables cleared and the set-up out again when another gang of workers came along. We had to hustle every minute. There can be no legitimate

complaint about the food, either as to quality or quantity, and I would say that it was well chosen to suit climatic conditions. But the men, when they came in from the job, were so exhausted from the heat it was impossible for them to eat a substantial meal. Possibly the best indication I can give of the temperature is found in the fact that practically no one works in anything other than a pair of trousers and shoes. It was quite a sight to see a hundred or more men trying to eat, all stripped to their waists, with rivulets of sweat running down their faces and backs. While I was there two men were brought in who had passed out completely. One, a commissary clerk, collapsed in his tent after he finished his work and had convulsions. There was no doctor. Buckets of ice water were thrown on him. This was the only medical service he got, and we, the workers, gave it to him. He was taken into town later in a machine owned by a worker; we don't know whether he lived or not. From his condition I doubt it. The other man went under on the job. We threw more ice water on him. It was the only thing we knew to do, and the only thing we could do without medical advice or aid.

I heard all sorts of stories about men being blown up by premature explosions at the tunnel. The responsibility for this is variously laid to the faulty powder and improper mining methods. I am told that down at the dam site there is no medical or surgical help available, no hospital facilities, no first-aid equipment, no stretchers, no ambulances, nothing to protect the lives of workers.

So I quit. I would rather mootch on the main stem than work in a temperature around 140 for \$2 a day, and my meals, and then have to pay \$1.50 a month for insurance—particularly when the insurance companies specifically exempt the greatest element of danger, heat prostration.

I am willing to concede that the work is just getting under way. But the fact is that the United States government is permitting the "Six Companies" to "get away with murder" on a grand scale. So anything that you, or anyone else, can do to bring these facts to the attention of the country at large, ought to be done. The people of Las Vegas, and the workers individually, are powerless to meet the organized greed of the "Six Companies" which has the tacit endorsement or acquiescence of the Federal Government.

In the Driftway

ONE of the impressive arguments of the last generation, when people wanted to prove the bounteous providence of nature, was the travel record made by a drop of water—the Drifter believes it was always called, affectionately, a little drop of water. Starting far off in the Indian Ocean, but lifted by the sun's fond rays into the cerulean sky, the little drop of water was carried, or not infrequently wafted, on the wings of the gentle winds to the slopes of the soaring Andes, where, cooled by the dark woodlands that stretched their eager arms aloft, it was precipitated as rain. Something of a come-down, to be sure; but That is Life. And anyway, after lingering joyously in a mountain lake—probably a clear mountain lake—the little drop roved adventurously down through valleys and across plains, finding at last a welcome from its trillions of com-

panions in the vast Pacific. Still a long way from home; but there is no need to trace this odyssey more, save to concede that on the universal rounds there was every opportunity to be frozen into an iceberg, stand poised for a second on the tip of a geyser, or dilute a demi-tasse.

* * * * *

YET the cold truth is that nature continues to be somewhat less bounteous than a reasonable man might desire; and even with water it can be niggardly with a certain grim humor. Those lines of the "Ancient Mariner," "Water, water everywhere, nor any drop to drink," possess a poignancy dimmed only by enforced repetition in a schooling that made even death at sea by thirst seem often a mild fate. And not so long ago the Drifter came upon an item in the foreign press that made him drop the paper—a little drop, at least—and stare off over the wilderness of the imagination. "The Norwegian steamer Vigdis left Cardiff on Saturday, with a cargo of 835,200 gallons of Cardiff drinking water for supplying the twenty vessels engaged in whaling in the Antarctic. This is the largest quantity of fresh water ever shipped from Cardiff, and it is to be carried about 7,000 miles." Where, oh where are the film solons of Hollywood? Pursuing their unromantic piffle, when these things be? The Drifter hoped there was no storm off the Vigdis's bows. He turned to the daily reports of muddle and mess with a sigh, yet somehow with a lift of spirit. While men are able to carry water round the world in ships, and think no more of it than a few lines on page twenty-three, the human race has not been scuttled.

THE DRIFTER

Contributors to This Issue

HENDRIK WILLEM VAN LOON is the distinguished author, satirist and cartoonist.

WILLIAM HARD is one of the most distinguished of Washington correspondents, nationally known for his writings and radio talks.

GARDNER JACKSON is an independent Washington journalist well known for his work in behalf of Sacco and Vanzetti.

ROBERT DELL has for many years been a contributor to *The Nation*, the *Manchester Guardian* and other periodicals on conditions in France.

VIRGINIA MOORE is the author of a book of poems, "Sweet Water and Bitter."

CARLETON BEALS, author of "The Mexican Maze," is at present in Mexico where he is collecting material for a biography of Porfirio Diaz.

CUTHBERT WRIGHT is the author of "The Story of the Catholic Church."

FRED T. MARSH writes occasional book reviews for *The Nation*.

HAROLD WARD has written articles on scientific subjects for various periodicals.

JOSEPH J. SPENGLER is in the department of economics at the University of Arizona.

Books

Oh More Than Cruel Love

By VIRGINIA MOORE

Oh more than cruel love do studious books,
Talk, laughter, silence, work done swift and fair,
Plain food, long sleep, sharp drafts of living air,
Unbodied music and the bodied looks
From friend to friend, a flock of shadowy rooks
Soaring at night like hopes upflying there
Compose the mind, out of the bosom tear
Regrets thrust inward, huge and pitiless hooks.

Yet say I calmly on a night like this
Without a moon or even a poor star,
Or nights when moon and many planets are:
Love with its promise, true or false, of bliss,
Love that escapes or falls to ash like fire
Is all that I lack wholly or desire.

Mexico and Middletown

Mexico: A Study of Two Americas. By Stuart Chase, in collaboration with Marian Tyler. The Macmillan Company. \$3.

STUART CHASE learned more about Mexico in five months than most members of the resident American colony learn in thirty years. He traveled more widely, he studied more deeply, he met more varied groups of Mexicans; in short, he learned more about Mexican life and customs, about Mexican art, business, and politics than the conventional golf-club swingers at the Churubusco Country Club, who sit over tea and talk about bridge, servants, and the dirty "Yellowbellies," will ever know. Not only that, but Chase came with a well-filled mind, an enthusiasm for observing the most out-of-the-way details, with the approach of a trained economist, and with vision devoid of customary "American" prejudices. As a result he has written a fine and generous book about Mexico. Chase, himself, gives the clue to why he has the edge on the average American resident, whose closer and more permanent contacts should make it possible for him to know Mexico much better: Mexico's maize civilization is not primarily an acquisitive civilization, but one based upon leisure, creative work with the hands, religious festivals, and many other activities in which the element of profit does not enter. Most American residents are highly developed specimens of our own acquisitive civilization, who regard any individual or any nation not primarily dedicated to money-making as suffering from paranoia. In his closing chapter Chase undertakes to give advice to Mexico, to the American colony, and to Middletown, a task somewhat presumptuous, were it not that he speaks with so much wisdom and fairness. For the American colony, he has three words: "Díaz is dead." Chase is mistaken. For the American colony Díaz will never be dead, because he represents the masterly culmination of four centuries of acquisitive conquest. But Chase's words reveal why he came to know Mexico so well in five months.

I wish that Chase might have come to Mexico before Mr. Morrow made it popular, that he might have been here during the years of idealism and experimentation, instead of now, when the revolution he so much admires is dying, is practically dead;

before Plutarco Elías Calles, whom Chase lauds so much, had turned into an incompetent banker, a manufacturer, and a wealthy *hacendado*; before the so-called revolution had been shaped into a machine to enrich its political survivors and to crush all independent popular expression. Chase arrived in a twilight period and has not quite recognized the fact. Not that he does not see the handwriting on the wall; but in political matters his book is not quite realistic.

Yet he shows such sympathetic understanding of Indian values that he is never far from a true comprehension of all that is basically Mexican. His sentences leap up and down through history and back and forth across nations, opening up vistas that few other modern writers would be equipped to give. Not, perhaps, that he has contributed very much that is new to our knowledge of Mexico, but he has seized upon what is significant and has illuminated it by comparison and by subjection to his own philosophy of life. He has oversimplified pre-conquest history and has stated rather dogmatically his ideas on the structure of the Aztec state concerning points which are still open to controversy. And for a short summary of the Conquest, I find Anita Brenner's chapter in "Idols Behind Altars" more brilliant and more accurate.

Mr. Robert Redfield's excellent, intensive scientific study of Tepoztlán fortunately has formed the basis for most of Chase's conclusions about the Indian. To Redfield's careful work, Chase has added supplementary observations from other towns and has given the whole significance for us by comparison with Middletown. I wish that he had also correlated for us some of the reactions of the two representative populations with regard to such manifestations as patriotism, sex, marriage, and death.

Chase does not sentimentalize the Indian or his way of life, though he is skilful in picking out what is sane and beautiful in his existence. Chase himself admits that he could not live very long in Tepoztlán, and thus does not expose himself to the criticism of a certain Mexican politician in the educational department, who made a speech at the University of California, eulogizing the Indian and declaring that he himself would prefer to wear leather-thong *guarachas*—and then went out and bought a Locomobile in which to visit the schools of the State. Tepoztlán happens to be one of the happiest native villages in Mexico. Chase does not recognize enough, I fear, that the Mexican fiestas and playtime are rooted in a deep and ignorant fanaticism and contribute to the Indian's enslavement to the Spanish-Aztec church; that they are, in part, the reflex to elementary hunger and lack of other forms of organized play.

Not all villages are so happy. Recently, on a month's horseback trip through the Mixtecan Indian region of Guerrero and Oaxaca, I discovered an abject poverty startling even for Mexico. The maximum wage, except for a few more fortunate citizens, is seven cents a day; which means that even though corn may be grown in addition for tortillas, the people are mostly in dirty rags, that small-pox and fatal measles are endemic, that infant mortality is incredibly high, and that during certain months of the year in some villages it is impossible to get anything real to eat; the inhabitants live on roots and berries. The mail carrier from Tlapa to Ometepepec recently died of starvation on the road. Under such conditions of life there can be no individual stamina, no illumination of the spirit, and the Indian turns to chronic drunkenness (making his own *mescal*) and to Church festivities for temporary escape. In other words, it is fatal to generalize about conditions of life in a country so startlingly varied as is Mexico. In the broader sense, of course, Chase has seen the problem clearly: "We are not quarreling with the machine as such, nor are we senti-

mentally satisfied with machineless men. Between . . . and bolting industrialism raw as Middletown has bolted it, they had best hold hard to their basic pattern."

Nor can I quite agree with Chase's dictum that Mexico has been declining for four hundred years, and that in 1917, with the promulgation of the Querétaro constitution, Mexico was suddenly reborn, even if it is the status of the Indian which is in point; any more than I would admit that England was necessarily declining under Roman, Danish and Norman rule. Certainly the Indian renaissance had been at work in Mexico, even before the achievement of independence; and the reform movement of Juárez attempted most of the social changes inherent in the movement against Porfirio Díaz; indeed a full-blooded Indian arrived at the Presidency; and it cannot be said today that the Indian is closer to control of the state than he was then. Nor was Mexico necessarily declining even under the dictatorship of Díaz, whatever his repressions. To take that point of view is to simplify history to a social creed.

But quite apart from any minor modifications or reservations one might make, Chase's book is an admirable piece of popularizing, which cannot be recommended too highly as a most readable interpretation of Mexico, which places its emphasis, not upon the finances, the industries, the methods of exploiting Mexico's wealth, but upon the Mexican people, upon the basic Indian population, how it lives and works and plays, its aspirations, its struggles, its defeats and victories. Every reader, as he follows along these magic bypaths, will recognize, especially in this hour of depression, that we, in our feverish industrialism, have lost many of the most valuable and richest secrets life holds. This is a warm human book.

CARLETON BEALS

Our Royal Court

Washington Merry-Go-Round. Anonymous. Horace Liveright. \$3.

The Mirrors of 1932. Anonymous. Brewer, Warren and Putnam. \$2.50.

WE Americans at bottom are a nation of royalists. True, we do not want a king to rule us, and we profess to believe, sincerely I think, in at least the principles of democratic government. But we sorely miss the pageantry, the tinsel and trumpets, and all the other dazzling but inconsequential elegances one ordinarily identifies with royalty. We the people are sovereign, but some primitive appetite within us craves a tangible symbol of our sovereignty, of our collective egoism. Though we eschew kings, we must have a visible king-head. And so we proceed to deify the one individual among us who most nearly personifies our national sovereignty; we tenderly, though perhaps unconsciously, place a halo over the President of the United States. He is our king. We read into his character many qualities that are not there; we weave legends about him, and concoct myths to sustain us in our moments of doubt. When we rebel against this monarch we do not depose him, nor do we seek to remove the conditions which created him; we merely change his name.

But a king must have a royal court. In a republic such as ours there is no hereditary nobility to draw upon; we must do the best we can with the democratic material that lies most conveniently at hand. Hence our royal court consists, and must consist, of the job-holders and social hangers-on who inhabit the city of Washington. Not all of us can live within bowing and scraping distance of the White House, but our politically elite, and a few other socially important personages, do reside within that charmed area. And they are forever making the most of their good fortune. That their performance

is often petty and tawdry, when not actually shot through with sham and cheap posturing, is no fault of these royal actors. It is the fault of a democracy that somehow cannot make noble lords and ladies out of otherwise successful politicians and their socially ambitious wives.

But the performance that goes on daily in Washington is by no means a total loss. For those who can appreciate good entertainment it affords the greatest, most gorgeous show on earth. And here, between the covers of "Washington Merry-Go-Round," a half dozen young writers have got together in skilful fashion the intimate and revealing details that make up this amusing public circus. "Washington Merry-Go-Round" tells who the players are, why they have come, and where they have come from. It portrays (betrays, one might almost say) their petty social activities, their provincial worship of form and precedence, their social, diplomatic, and matrimonial wars ("... as in all one-industry villages these feuds are waged so earnestly that before they are over they line up on one side or the other almost every one in town. . .'), and their manner of playing politics. No one who is anybody in Washington is neglected. They are all included from the President down. The professionally polite folk, led by "a half dozen middle-aged or aging ladies who absolutely dominate the social stage," are trotted out in an act entitled "Boiled Bosoms." The diplomats are paraded before us in all their "starched futility." The nice young men of the State Department come in with their pink peppermints—and papa's check-book. The inmates of "The Monkey House" on Capitol Hill, the Sons of the Wild Jackass, whose godfather is Senator George Moses, and the Vestal Virgins of the White House secretariat are all permitted to speak their brief but entertaining lines. But no royal court would be complete without its ponderous dukes and well-meaning barons who are forever doing something for the plain people. In "Washington Merry-Go-Round" we find these men given each a chapter to himself. They include such famous individuals as Egg Charley, the Vice-President; Wrong-Horse Harry, the Secretary of State; Little Nemo, the former Ambassador to Mexico, and Andrew Mellon, "the man who stayed too long." Last, but by no means the most insignificant, come the oft-neglected chroniclers of the court, the members of the corps of Washington correspondents. Here we are told, for example, that the *New York Times* "does not pay its Washington Bureau chief a large salary for his news gathering or news writing ability. What it wants and gets from Oulahan is 'front' . . . Oulahan is at his best as a host and as presiding officer at a banquet. . . . He is welcomed everywhere in Washington society. . . . He has a beautiful Georgetown home where he entertains as befits the socially prominent Washington correspondent of the *New York Times*. . . . His writing for the most part is confined to 'policy' stories. Policy stories are neatly turned editorials printed in the news columns, with a news atmosphere about them, but which are actually propaganda for someone or something that the paper favors."

I am only guessing when I say that at least six writers cooperated in the pleasant task of turning out "Washington Merry-Go-Round." It seems inconceivable to me that so many illuminating facts and so many delightful anecdotes could have been assembled by one person, or even by two or three persons. So replete is this book with carefully measured detail that it must be thoroughly read to be appreciated—and enjoyed. A simple review could never do it adequate justice. Not so much can be said of the "The Mirrors of 1932." This latter work is obviously the effort of a man—or woman—with a good memory, a batch of newspaper clippings, and a few afternoons to spare. It could have been written in a day or two; certainly it can be read, and forgotten, in less time than that. Yet it is not without its value. It examines with patience the character and qualifications of the present occupant of the executive

palace in Washington, and finds him wanting. It does the same thing for nine supposed aspirants to his democratic throne (though for some curious reason not clearly brought out it treats Newton D. Baker with maternal gentleness). It is well to know something of these men of whom one or another may some day preside over our political affairs. But the anonymous author would have done better to engage in a bit of research before sitting down to write this book. Too many of its facts and anecdotes have grown thin with retelling.

MAURITZ A. HALLGREN

"Bad" Boys

Natural History of a Delinquent Career. By Clifford R. Shaw. University of Chicago Press. \$3.

Fifty-five "Bad" Boys. By Samuel W. Hartwell. Alfred A. Knopf. \$3.50.

"IN reviewing my life," begins the youthful hero of Mr. Shaw's study, "I now know and, in fact, always knew, without knowing how to avoid it, that it was a pointless, aimless, haphazard sort of existence. I failed miserably to understand life. The critical periods I bungled. The only emotions I felt were the emotions of the hurt."

This strikes one as a remarkable confession on the part of a proletarian little Rousseau condemned to long years in a penitentiary for "rape." They are the untouched words of a youngster still in his teens, and yet of how many men and women, white-collared, responsible, respectable, and unhappy, could they not also be said! In reading Mr. Shaw's "case history," and recalling the first volume in the series, "Jack Roller," one is made conscious of the vast tragedy of wasted human material which our triple system of family, school, and urban environment does so much to foster and increase.

The fifty-five young boys assembled by Dr. Hartwell of the Worcester Child Guidance Clinic had happily not reached the point when they could say that it was too late to understand their lives. Many of them came from supposedly good families, hardly any of them were delinquents in a proper sense of the word, most of them represent a valuable salvage from the standpoint of social relationships. If this be the case, it is primarily owing to the doctor himself, who, if he is as good as his book, must surely be a prince of the sociological church. A key to his technique may be discerned in these lines which contain a lesson for most workers among boys: "Occasionally I see a child I feel I understand so well that I can predict his behavior and responses in any new situation by thinking how I myself would act and feel under similar circumstances." A perusal of his most interesting and moving book will convince the reader that bad homes, often quite "upper middle class"—viciously stupid or cruel parents—are frequently quite as responsible for a youngster's downfall and waste as are the anti-social influences so plentiful outside. The element of loyalty should be absent in such an environment, and the astonishing fact is that on the part of the boy it is often present. Certain pages of direct discourse are so intensely interesting that it is a pity that the doctor does not permit more of his young visitors to tell their own stories in their own way. One of the most striking is that of "Charlie" who always "seemed to expect some definite thing to happen that would suddenly change him, make him feel differently, and solve all his problems." Surely that particular and touching form of infantilism is not limited to the young "Charlies" of this world. Both Catholics and certain psychoanalysts still believe in the miracle apparently, and perhaps it is just as well that they do, at least from the standpoint of therapeutic truth.

CUTHBERT WRIGHT

Three Pleasant Novels

The Grasshoppers Come. By David Garnett. Brewer, Warren and Putnam. \$2.50.

Father Malachy's Miracle. By Bruce Marshall. Doubleday, Doran and Company. \$2.50.

Dwarf's Blood. By Edith Olivier. The Viking Press. \$2.50.

THESE three English novels, although they stand out superior to the ruck of the season's fiction, belong on one of the pleasant little byways of literature which lead nowhere in particular. They do not evolve from personal experience, from an ideology, from a passion for revelation or even unique expression. Each is a tour de force founded upon a fresh idea—the kind of idea which tempts one to write a book.

Mr. Garnett needs no introduction. The present long short story, an adventure tale about a fallen aviator who feeds on locusts until rescued, attains to perfection within its limits. One does not need to say that Mr. Garnett's modern "Robinson Crusoe" is exquisitely written. In addition it has its moments of glamor and excitement. Just what the author means to say, if anything specific, is elusive; but the shadows of meanings that flit through the prose are what give the little volume its principal charm.

Mr. Marshall's amusing and good-tempered satire tells how a dumpy little Scottish monk, in the true Christian spirit of faith and humility, effects an extraordinary miracle, and describes the results of the miracle as it touched on the public and press, the sporting and scientific worlds, the leaders of the Protestant churches, and on Rome itself. All are convincingly and delightfully indicated in a story which does not attempt to push its conclusions or its satire beyond the point of freshness.

Miss Olivier's novel has a great theme; but in developing it she has not been altogether happy. The story concerns a man whose mother was a dwarf, who suffered all his boyhood and youth from that fact, who escapes and marries happily, only to have his second child born a dwarf. To heighten his agony, the mother appears and reveals herself to the wife. The novel might have developed into a study in ultimate human values. And by all means the father, rather than the dwarfed child and its mother, should have stood out, in his strength and weakness, the central tragic figure. But Miss Olivier has allowed her novel to develop into a plot story thickened with realism and sugared by sentiment.

The first two of these volumes are well worth the reading for intellectual entertainment. They are urbane, deft, and amusing. Although they may say nothing very new or very powerful, they say it very well.

FRED T. MARSH

Human Culture

The Evolution of Culture. By Julius Lippert. Translated and Edited by George Peter Murdock. The Macmillan Company. \$5.

READERS of William Graham Sumner's "Folkways" will find themselves on familiar ground in this partial translation of a great nineteenth century anthropological classic. Julius Lippert, a Bohemian whose life covered the latter part of that century (he died as late as 1909), was one of those versatile, enormously industrious scientists who seem to take all knowledge for their province. Specializing more and more in the social sciences he produced a body of work which was finally incorporated in the two-volume "Evolution of Culture," first

issued in German in 1887. This book has had a wide, though uneven influence in Europe, but in England and America has been comparatively unknown, although Sumner and Keller mentioned it no less than 400 times in their monumental "Science of Society." The small portion (less than half of the original) now translated, with a very able introduction and several appendices, by Professor Murdock, is an excellent handbook on anthropology for readers who are careful to make allowances for later and more accurate research. Lippert's "economic" point of view (one of the reasons for his great popularity in Russia) enabled him to treat of such difficult questions as race, marriage, sex, and religion with considerable insight and without the sentimentality so prevalent in the "English" school dominated by Westermarck; at many points he anticipates the attitude of so important an anthropologist as Robert Briffault—who, indeed, frankly acknowledges Lippert's wholesome influence. The amount of information gathered together is extraordinary; and the author's freedom from many of the errors of sociological thought easily compensates for what must often seem tiresome, obvious, and long-winded in his work. Professor Murdock has performed a valuable service in introducing this book to English readers.

HAROLD WARD

Problems of Population

The Principle of Population. By Francis Place. Edited by Norman E. Himes. Houghton Mifflin Company. \$4.50.
Population Problems. By Warren S. Thompson. McGraw-Hill Book Company. \$3.75.

THE dates of these two volumes practically bracket the period within which current population theory and practice developed. In "The Principle of Population," which originally appeared in 1822, is found the first recommendation of birth control in the English language. The author, a self-educated workingman and one of the most effectively aggressive radicals in nineteenth-century England, sought to show in this work that the truth in the Malthus-Godwin controversy lay in between the extreme views of these writers. Place rejected both Malthus's "moral restraint" and Godwin's optimism, and emphasized that birth control offered the only real solution of the population problem. Shortly after that he helped to organize the international birth-control movement by engineering the distribution of contraceptive handbills and by training a small but sturdy band of disciples. The present edition of Place's work is an exact reproduction of the original and contains a valuable introduction by Norman Himes, the leading authority on the English neo-Malthusian movement.

Dr. Thompson's work is the most comprehensive general text on population yet to appear. Only the history of the birth-control movement and the development and effects of modern sanitation and preventive medicine are neglected. Thompson's data show that, as a result of the full flowering of the contraceptive movement originally fostered by Place, population growth has nearly ended in many countries. Modern man must cope not with overpopulation but with problems arising out of cessation of population growth and possibly with depopulation. Thompson rejects the doctrine of an economic optimum population, finds urban life on the whole to be disadvantageous to man, and sees in the international distribution of population perhaps the leading political problem of the day. He rejects positive eugenics, stating that selection will not be dysgenic so long as multiplication of the unfit is bridled. None can read this valuable work and fail to note the close relation between population growth and distribution and socio-economic welfare.

JOSEPH J. SPENGLER

Books in Brief

God in the Straw Pen. By John Fort. Dodd, Mead and Company. \$2.

Mr. Fort's new novel resolves itself into a powerfully written study of Methodist evangelism as waged in the up-country of Georgia circa 1830. The finest parts of the book are the series of prose portraits of the many types of hill country people, and the culminating revival scene. The conflict which makes the volume a novel lies between the two itinerant preachers who come to Ryall to conduct an extended revival—Isham Lowe, a noted hell-fire evangelist of "shoutin' Methodism," and young John Semple whom Lowe in the past had "saved," befriended, and inducted into the ministry. John's growing resentment against the older man leads to his throwing off forever the intolerable burden on his spirit of his religious work, but this is not accomplished until he has preached his last sermon—an extraordinary piece of oratory which Mr. Fort has rendered with remarkable understanding. This is an absorbing volume, if only as a poetic study in early Americana.

The Hex Woman. By Raube Walters. The Macaulay Company. \$2.

This story is primarily a straight narrative retailing the lives of three women, triplets, who lived in the Pennsylvania Dutch country during the middle of the last century. None of them ever married, and they always lived together in the home which Aunt Susan had willed them. After years of poverty they take up the practice of witchcraft with great success and become prosperous hexers. But when Elizabeth, the leading spirit of the three, gives birth to a dead child, they lose their prestige. The novel does afford a little insight into the prevalence and workings of this mysterious superstition which, it would seem, is not even yet entirely dead in this region. But even in this respect it is far from satisfactory. The reader is not made to feel the reality of the faith and fear which the witchcraft inspires. And as a study of three women who grow into old age, of their pitiful attempts to find love, of their successes and despairs, of their periods of poverty and affluence, the novel, although sometimes moving, is not especially distinguished.

Torture Garden. By Octave Mirbeau. Translated from the French by Alvah C. Bessie. With a Foreword by James Huneker. Claude Kendall. \$2.50.

Huneker in his Foreword (a few pages reprinted from "Bedouins") calls this novel, first published in France in 1899, when it created a sensation, "the most damnably cruel book in contemporary fiction." The characterization would seem to be justified. In its description of tortures it exhibits a mind tainted by the most frightful intellectual sadism. But to Mirbeau, rebel with a large streak of humanitarianism in his make-up, the *Torture Garden* was a symbol not only of all society but of nature itself.

Cold Blue Moon. By Howard Odum. Bobbs-Merrill Company. \$2.50.

The author of "Rainbow Round My Shoulder" here evokes a picture of ante-bellum Southern life—ghosts, fox-hunting, racing, and the like—through the mind and language of his black Ulysses. The result is one of monotony and flatness; each ghost story receives the same emphasis, the manners related all have a blurred, sentimental, unauthentic Negro air about them. The language of black Ulysses has certain richness, but there might have been more rigorous selection from among the occasionally interesting stories and episodes.

Cost of Government in the United States, 1928-1929. National Industrial Conference Board. \$3.

This summarization of the income, expenditures, and indebtedness of the federal, State, and local governmental units is a continuation of the useful work previously done by the board in this field. While the national income, as estimated by the board, increased by 135 per cent from 1913 to 1928, public expenditures rose by more than 300 per cent to a gross total of \$12,609,000,000. The federal debt, nearly all of it arising out of the war, was reduced from \$22,711,000,000 in 1922 to \$17,318,000,000 in 1928, but meanwhile State and local indebtedness increased from \$7,154,000,000 to \$12,609,000,000, so that the total public debt in the two years was almost exactly the same. Tax collections, which took 6.4 per cent of the national income in 1913, absorbed 11.5 per cent in 1928. The rapid growth of public expenditures, it is plain, is due not alone to the war, but to the expansion of government functions, education, for example, absorbing one-fifth of gross total expenditures in 1928, and highways, thanks largely to the automobile, one-seventh. The most cursory examination of the figures indicates the enormous importance of the wise collection and the efficient administration of public funds, and the National Industrial Conference Board is performing a service not only to business men, but to all responsible citizens, in this series of studies bringing together the outstanding facts of government income and expenditure.

Political Consequences of the Great War. By Ramsay Muir. Henry Holt and Company. \$1.25.

Save for its disproportionate emphasis upon things British, this is as good a brief account as there is of the World War settlement and its political consequences. Professor Muir gives a critical summary of the peace terms, traces the development

of democratic institutions in Great Britain and Germany and governmental ups and downs in other states, outlines the new relations between Europe and non-European countries, and discusses at some length the growth of internationalism and the changes within the British Empire and in the relative importance of Britain in the world. Like most British writers, he is hopeful about the League of Nations in spite of its failures and imperfections, but his criticism of parliamentary government does not encourage confidence in the inherent goodness or lasting qualities of that system. The economic and social changes of the period are not included in the survey.

France Under the Bourbon Restoration, 1814-1830. By Frederick B. Artz. Harvard University Press. \$4.50.

There has been no very good treatment in English of the period of the Bourbon restoration, and Professor Artz's book is a useful attempt to supply what was needed. The period, while not brilliant, was important. There was no more liberal state on the continent than France after 1815, and the extended experience of self-government which it then enjoyed for the first time stood out in sharp contrast to the autocratic and oppressive political system of which Metternich was the embodiment. Socially, the period was characterized by the slow emergence of an industrial bourgeoisie from under the influence of the conservative small landed proprietors, with a consequent modification of the conditions of town life. Important movements of liberal Catholicism in religion, of eclecticism and positivism in philosophy, of socialism in economics and government, and of romanticism in literature, painting, and music are the more striking intellectual characteristics of the decade from 1820 to 1830. Of all these and other related matters Professor Artz gives an orderly and instructive account. The bibliography, for a book of moderate compass, is of imposing sweep.

THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York. British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London, W. C. 1, England.

THE SUDDENNESS with which Mr. Hoover appointed Walter S. Gifford as federal unemployment administrator and a body of well-known men as advisers to deal with the unemployment problem in the coming winter is the clearest proof that his hand was forced by the increasing demand for a dole. Indeed, so great was the President's haste that he actually announced the appointment as one of the advisers to dazzle the country of a Mr. A. O. Smith, of Milwaukee, who has been dead these several years. So far as Mr. Gifford is concerned, no better appointment could have been made from the point of view of executive ability. If any one can tide the country over next winter without federal appropriations, Mr. Gifford probably can. We wish him heartily well, though we frankly do not believe his problem is capable of a wholly satisfactory solution and we are quite opposed to private charity being asked to assume what is the plain duty of the State. We need hardly tell our readers again that we are in accord with Governor Pinchot's demand for an extra session. He reports that experts have discovered in Pennsylvania more than 900,000 unemployed. "Distress," he declares, "in many counties is acute. Many children are suffering from partial starvation. . . . The hospitals are overburdened. . . ." Can Mr. Gifford alleviate conditions like these?

WE KNEW IT! We *knew* that the destroy-to-prosper campaign would go by leaps and bounds, and Governor Huey Long of Louisiana was the one to take the very next logical step. He called a conference at New Orleans of the leading officials of the cotton-growing States to create prosperity throughout the South by passing laws forbidding the growing of a single pound of cotton in 1932. There you have it—solve the problem of over-consumption by cutting it all out. A moratorium for European debts? Well, a holiday for cotton-growers, too. And how they would enjoy it! What a picture it suggests of all the white-goated cotton planters sitting back for a twelve-month in perfect rest and desuetude and all their labor, too, living richly on the proceeds of their financial gains of 1931. Gains of 1931? Yes, most assuredly. Dr., beg pardon, Governor Long says so, declaring that there would be "a complete return to prosperity in the South in two weeks." "The farmers," he insists, "will get more money from this year's crop alone than they will get for this and the next two cotton crops they raise," (without his law). The grounds for his judgment? The very best. He quotes the Bible itself: "The Lord told us to lay off raising these crops one year out of every seven to let the people have time to consume them." Great is the Governor of Louisiana. Alas, his counsel fell on deaf ears. His conference did nothing.

BUT WHILE AWAITING Long's millenium we are confronted with more practical and pressing problems. There is the Farm Board's wheat surplus to consider. Some of this is going to Brazil in exchange for coffee; another portion may be sent to the Chinese famine and flood victims. We are happy to note that the Board is no longer worrying about the insecure credit position of the Chinese Nationalist government, and is now prepared to sell China 15,000,000 bushels of its wheat. To have hesitated, while millions of Chinese were starving, because Nanking might not have been able to repay us, would have been sheer nonsense. We fed the war victims in Belgium and the famine victims of Russia without asking to see the books of their governments or have our money back. We could well afford to be similarly generous to the Chinese and give them as much of our surplus wheat as they need. This would not be a mere act of charity—we should also be helping ourselves. Storage and other charges on surplus grain held by the Farm Board threaten in time to exceed the original price paid for the grain, and by giving the wheat to China we should be relieved of this burden. Moreover, our charity would not constitute competition with the current crop, and the American farmer would benefit by the removal of a surplus the existence of which has so largely depressed grain prices.

IT SEEMS THAT THE LOUDER the Republicans shout their praises of the tariff the worse our foreign trade becomes. Exports in July totaled only \$183,000,000, which was the lowest figure reached for any month since September, 1924, when exports dropped in value to \$156,100,000. Imports did a little better in July as compared

with June, increasing in value by \$1,327,000, but this slight gain was not significant because June imports were at the lowest since September, 1921. The figures for the second quarter of 1931, just issued by the Department of Commerce, tell the story even more clearly. In the period from April to June the value of exports amounted to \$606,000,000, and that of imports to \$540,000,000. This was not only below the preceding quarter and far below the same quarter of last year, when these figures totaled \$946,000,000, and \$843,000,000 respectively, but they represent the lowest point reached in the value of our foreign trade since before 1921. Beginning with this week's issue, *The Nation* is presenting a series of authoritative articles on free trade, which in large measure will analyze the fallacious arguments of the high-tariff advocates. The articles are presented, not in any hope of converting the Republicans, for that is plainly impossible, but in the belief that they will reveal to the public the untenability of the Protection position wherever it is held, and will show how considerable is the responsibility of tariffs for the world's economic collapse.

HUNGER AGAIN HAS BEATEN the miners. Reports from the coal fields of West Virginia, Pennsylvania and Ohio say that the strike has been broken. Frank Keeney's strike committee in West Virginia will seek to carry on a while longer, concentrating on a few mines where conditions have been the worst. The workers in the other towns have been ordered back to their jobs. In western Pennsylvania and eastern Ohio the National Miners' Union is following somewhat the same procedure. In that area 75 per cent of the 40,000 strikers have returned to the pits. This does not mean that the struggle of the miners for existence has ended. The wages being paid are still at a starvation level; suffering and privation are still to be observed in every mining camp; the need for relief is still as great as it ever was. The breaking of the strike means simply that the miners and the mine unions are completely helpless. They cannot by their own efforts change the economic conditions which have reduced the bituminous industry to chaos. The operators refuse to act. Only the government can help, and until it intervenes hunger or dire want must remain the daily lot of most of the miners and their families.

AT LAST the "undesirable" alien has been cleared of most of the blame for our widespread crime which we have been thoughtlessly and all too eagerly dumping upon him. An inquiry into the facts has revealed that the foreign-born residents "commit considerably fewer crimes than the native-born." So states the Wickersham Commission in the last of its many reports. The aliens, the report continues, "approach the record of the native-born most closely in the commission of crimes involving personal violence," but "in crimes for gain the native-born greatly exceed the foreign-born." Thus is wiped out one of our most cherished national myths. If we cannot blame the foreigners for our shortcomings, who then are we to blame but ourselves? Dr. Edith Abbott of the University of Chicago, who conducted the factual survey, sees it precisely in that light. The myth was largely based, she said, upon "our ready acceptance of the easy theory that our social difficulties are not to be charged to our own mistakes and failures. It is easier to charge our crime record against immigrants than against an

inefficient and corrupt system of police and an outworn system of criminal justice."

THE WIGGIN COMMITTEE accomplished two things: it worked out an arrangement by which Germany's short-term banking debts will remain "frozen" for six months—thus providing a breathing space for Germany in its private obligations, to supplement the year's breathing space in reparations payments—and it has had the courage to point out that neither of these postponements is likely to prove of the slightest value unless "all the governments concerned . . . lose no time in taking the necessary measures" for insuring Germany's solvency. The committee, it is true, does not say directly that reparations are excessive and must be reduced, but the calm and inexorable logic with which it states the financial situation is perhaps even more impressive than such a direct statement would have been. The committee points out first, that "until the situation in Germany improves there can be no general recovery"; secondly, that it is absolutely essential that Germany obtain long-term credits, if only to convert part of its unmanageable volume of short-term credits; thirdly, that such long-term credits can not be obtained without the confidence of investors; fourthly, that this confidence will not exist "so long as [Germany's] obligations, both public and private, are such as to involve . . . a continuous increase in snowball fashion of the foreign debt of Germany." That this report received the signatures of the French and Belgian bankers represented is significant and encouraging. But the element of time is a vital one: the bankers of ten countries have not merely said in effect that Germany's indemnity must be radically reduced, but they have hinted this must happen before the present creditors' agreement expires in February.

OUTWARDLY CALM, Germany nevertheless remains in a precarious position. Unemployment is growing again, the number of jobless having increased 114,000 in the first half of August to 4,104,000. Ambassador von Prittwitz has forecast a total of 7,000,000 unemployed by winter, adding that "the country will not be able to support so large a number." The same view is expressed in reports directly from Berlin, which say that "the number of jobless will jump greatly in September and October." July tax receipts fell \$44,000,000 below the budgetary estimate. It is now forecast that despite the reparations moratorium and the desperate efforts of the Brüning government to economize and to find new sources of revenue Germany will by the end of the current fiscal year next April face a deficit of \$252,000,000. On top of this comes the disheartening prediction from the *Institut für Konjunkturforschung* that "the credit crisis will soon react unfavorably on industry." Meanwhile the Berlin government is doing what it can to relieve the situation. Its latest move consists of an attempt to compel the states and communes to reform their finances and balance their budgets. Unfortunately, this move is meeting stiff resistance from the municipalities, whose own revenues have been falling off.

INDICATIVE OF THE IMPORTANT changes Europe is undergoing is the resignation of Count Stephan Bethlen from the premiership of Hungary. For ten years, while in other countries leading statesmen were rising and

falling, sometimes with amazing rapidity, Bethlen had stood fast at the head of the Hungarian government. He rose into power with the reaction to Bela Kun's dictatorship, had outridden the many post-war storms of his own country and of Europe, had had himself upon occasion to resort to dictatorial measures, only to fall at last. Coming so soon after Hungary had obtained a much-needed loan of \$25,000,000 from a European syndicate headed by French bankers, it is suggested that his resignation is in some way connected with the loan. Many commentators have asserted that the French made his resignation a condition of the loan. Whether or not this is true, France will benefit by the change. Bethlen was frankly Italian-minded; his successor, Count Julius Karolyi, leans heavily toward France. The terms of the Hungarian loan are being closely guarded, but its political conditions are said to be so drastic their publication might cause a serious political upheaval in Hungary. Among other things, Budapest is rumored to have agreed to drop its decade-old campaign for treaty revision, the keystone of Bethlen's foreign policy. If this be so, France has won a temporary victory in its dangerously fanatical struggle to preserve the status quo of Europe.

WE CONGRATULATE Dr. Linus Pauling, who is only thirty years of age, upon his winning of the Langmuir Award. This prize, recently founded by Dr. A. C. Langmuir, an industrial chemist of Hastings-on-Hudson, New York, is bestowed annually "in recognition of the accomplishment, in America, of outstanding chemical research by a young man or woman preferably working in a college or university." The donor intended it as an expression of the gratitude of industry for the valuable contributions it has received from the young scientists of the country. Dr. Pauling is professor of chemistry at the California Institute of Technology. He has already written more than two score papers dealing with his special subjects, crystal structure, the quantum theory of gases, atomic and molecular structures, and the nature of chemical bonds, which have attracted widespread attention. In selecting him to be the first person to receive the Langmuir Award, the jury of the American Chemical Society paid high tribute to his ability. One of its members described Dr. Pauling as a "rising star, who may yet win the Nobel Prize." The young California chemist has the greater part of his life before him. May he prove a worthy successor to Dr. T. W. Richards, Professor A. A. Michelson, and the other great American scientists who have recently left this mundane sphere.

IN BARRING A SCENE showing an infant at its mother's breast, the Board ruled that the breasts of civilized women may not be shown." Yes, thus the New York State Board of Motion Picture Censors, at work on August 5, 1931. The representation of a civilized mother in the act of nourishing her child is either so degrading, or so immoral, or so conducive to immorality, that it must not be shown to the gaze of the twelve million people who live in the Empire State! Could anything be more characteristic of censorship stupidity? Or illustrate more clearly how little we have really progressed from the smug hypocrisy of the Victorian age? A naked savage woman's breasts, be she African or South Sea Islander, can now be safely

and legally revealed. But an American mother's—Heaven forbid! Her civilization, it appears, has made out of one of the most touching and beautiful human relationships something to be hidden as base, unworthy, disgusting. Yes, this in a city where naked women can be seen daily on the stage—with their breasts well emphasized to lure the crowds; in a city where one can buy on every newsstand "art" magazines filled only with nude pictures, breasts and all; where people freely advertise the sale of pornographic pictures. But what's the use? The Anglo-Saxon must, we suppose, remain a dirty-minded hypocrite. So henceforth no screen representation of a mother nursing her child can appear in New York, not even in a scientific film dealing with the story of human life and its evolution.

PERHAPS THE MOST OMINOUS SIGN of the low estate to which the Presidency has fallen comes from Chicago. The President will not even be used to start the machinery at the Century of Progress Exposition there in 1933. The switch will be thrown on this time by the giant star Arcturus. A beam of light coming from there will be directed into a photometer, turned into power, amplified, and used to throw switches in the Hall of Science. Someone, figuring that Arcturus is forty light-years away, has argued that the idea is a very happy one, for the light that will come from there will have started on its journey in 1893, during the World's Columbian Exposition. None the less, whatever the excuse offered for the plan, it can only be regarded in the White House with the gravest misgivings. For the idea may spread. Soon it will be the light from Arcturus that will be used to throw in the first baseball at the beginning of the season, and then, beyond doubt, will come the "Arcturus for President" movement.

SURELY NO BRAVER and finer American woman than Mrs. Robert M. La Follette, who died in Washington on August 18 the widow of a great Senator, the mother of both a Senator and a Governor of a great State, has graced our political life. More than thrice blessed was she for she had daughters, too, to do her honor. But always she preferred to keep herself in the background—the task of succeeding her husband and the opportunity of being the first woman Senator in Washington by election was offered to her before she waived her chance in favor of her son. It is a characteristic American story of simple beginnings in her married life and of a remarkably happy copartnership in which she was always the intellectual ally and aid of her steadily mounting husband. In days of prosperity and adversity her spirit remained untarnished and unafraid. When the wickedly unjust storm of criticism and abuse burst over her noble-spirited husband in 1917 because he had the courage, the patriotism, the loyalty to our institutions to oppose the criminal folly of our entering the World War, she remained calm and serene, justly certain that sound American public opinion would assert itself again. So she lived to see nearly 5,000,000 Americans vote for her "traitor" husband for the Presidency; lived to see his statue unveiled in the Hall of Statuary in Washington the gift of his State; and to experience what perhaps has come to no other American mother: both her sons exalted to high office by the repentant State which a few years before had burned their father in effigy.

The End of the Labor Government

THAT is what the news from London means—the second MacDonald ministry is definitely at an end.

If in the new "national" coalition ministry, which takes its place, Ramsay MacDonald still presides, no one in London seems to believe that this is for more than a few weeks. Whether there will then be a general election, or the Tories will take hold, time will show. The event means, however, far more than the exposure of the deep rift in the Cabinet and Labor Party over the radical measures proposed to balance the British budget, and the question of free trade and protection. It reveals to the whole world the gravity of the British crisis. Never before in time of peace has there been such a coalition of "all the talents." Never in recent history has British finance been in so precarious a situation. How to cut \$600,000,000 out of the budget is the problem. The Conservatives and some of the Cabinet demanded a ten per cent cut in the dole and the trade unions opposed. Between the two the collapse of the Labor Government was inevitable even had there been no other points at issue.

What the next days will bring forth no one knows. The alarmingly fast disappearance of the \$250,000,000 credit allowed to Great Britain by the Federal Reserve Bank of New York and the Bank of France, tells its own story. But the anxiety of the hour should blind no one to the truth that the fall of the MacDonald Government is a misfortune not alone for Great Britain, but for the whole world. Whatever its shortcomings—and there have been many—the MacDonald Government has achieved extraordinary things in the conduct of foreign affairs. Its viewpoint is precisely what the world has immensely needed in this crisis. That is no rhetorical exaggeration, but an exact statement of fact. One has only to realize what an immeasurable boon it would be to mankind if a government with the policies and principles of the MacDonald Cabinet were to take office in France. That would mean the assumption of power there by men of an international point of view, keenly alive to the social and moral responsibility of each government for the welfare of the whole group of nations; bent, with whole soul, upon disarmament and the abolition of war, and determined to build a far better and juster order of society than that which plunged the world into the catastrophe of August, 1914.

No one can adequately measure the benefit which every civilized nation has derived from the leadership of MacDonald, Henderson, and Snowden. We believe those to be utterly wrong who think that had the Conservatives or Liberals been in power this crisis might not have occurred. When one thinks of the mischief Neville Chamberlain, Winston Churchill, and Stanley Baldwin, with their extreme nationalist beliefs and policies, could have done during the past two years in Europe and in Asia, we have one measure of the worth of MacDonald and his associates. Indeed, one's heart sinks at the prospect that the coming Indian Conference and the Conference for Disarmament in Geneva next February may be guided by Tory imperialists; that in place of the gracious and winning MacDonald there may be found

one as limited in vision, and dull in expression and tame in leadership as Stanley Baldwin. He must be bold, indeed, who would assert that in the present financial situation a Conservative Government would have done better than MacDonald. He has been scrupulous in consulting the leaders of the other parties in every crisis. He has taken the very best advice to be had on the financial side. The gravity of the situation is such as to challenge anybody and everybody and make it necessary that all people in England who can help should get together to find the way out. If a national coalition government can do this it will be eminently justified. It is unnecessary and idle to seek to apportion the blame for the crisis. The fact is that the fate of England does not lie in its own hands. It is intimately tied up with that of Germany, and of other Continental countries. If Germany falls economically it may be impossible to tide England over. Yet how is it possible to go on extending credits indefinitely? England must set its house in order, and there must also be a revision of all the international debts and reparations. It is the eleventh hour, and it is time for statesmen everywhere, and especially in Washington and Paris, to take notice.

We are not under any illusion as to the disappointing record of the MacDonald Government in domestic affairs, and have frequently been tempted to speak out about it more emphatically than we have done. It is undeniable that Mr. MacDonald has alienated the younger men and women of his party; that he has grown steadily more conservative as the months of his holding the premiership have heaped up. There are few radical measures to be laid to the credit of what was to have been a most radical government. MacDonald himself has drifted so far from the radical views of the Independent Labor Party, of which he was for many years happy to be the head, that he resigned from it a year or so ago and repudiated it with contumely. His Cabinet has been weak at a number of places. It has not only not achieved the promised reduction of unemployment; it has had to see the roll of unemployed, which it swore to reduce as soon as elected, increased by a million more unfortunates. Yet granting all this, were we Englishmen and members of the Labor Party, we should say frankly that we considered the achievements of the MacDonald Government in foreign affairs vastly more important than its failures at home, indeed of such transcending importance as to reflect the greatest credit upon MacDonald and his associates. It is an open question, however, whether the logic of events which compelled MacDonald to follow his bent in devoting himself primarily to international matters, will not now result in a cleavage of the Labor Party to make its return to power impossible for years to come. It is quite possible that MacDonald will never again be Prime Minister for the Labor Party; that his career as leader of England will cease with the life of the new national government. None the less, we believe that his administration will go down in history as one of the greatest of British governments, one that nobly did its uttermost to hold the world together and to lead the way out of the morass in which every nation is today mired. Its place is secure on the scroll of fame.

Bayonets Control Oil

THE recent spectacular action of the governors of Oklahoma and Texas in calling out the troops to curb the production of oil in their respective States represents simply an eleventh-hour move, under pressure of a demoralized market, to control a situation that should have been taken under governmental control years ago. As a people we have been wasting all our natural resources flagrantly, but no other waste has been quite so flagrant as that in the oil fields.

In dealing with the problem of petroleum it is important to recognize just how special the problem is. What has first to be recognized is that the action of Texas in restricting oil production and of Oklahoma in shutting down oil production temporarily can in no real sense be compared, for example, with the recent proposal of the Farm Board that the cotton planters plow under every third row of cotton. Both, it is true, aimed at raising the price of a commodity by reducing the supply. But the Farm Board wanted to achieve this by an actual destruction of already created wealth, while Texas and Oklahoma are in no strict sense even curtailing "production." The oil already exists; it is merely underground. What the two Southwestern States are really attempting to do is not to curtail "production," but to stabilize extraction. Unrestricted competition becomes ruinous in the oil fields wherever many competing companies have sunk wells in one "pool." The situation is then precisely analogous to that when several youngsters each have a straw in one ice-cream soda. No matter how necessary the conservation of oil may be, no matter how demoralized the oil market may be at any time, each company must maintain a maximum extraction, for if it relaxes, or chokes the flow, its rivals will draw its oil away from it. The result is that every field is exploited to the utmost; as soon as a new field is brought in, the market is flooded with oil, the price collapses, and low price produces an extravagant wastefulness in use.

In view of all this there has been a great deal of agitation, not all of it, one fears, disinterested, for the repeal of the Sherman Anti-Trust Act. What is happening in oil, we are told, is merely an example of what happens under a regime of competition; and it is obvious that our first duty is to abolish the law that seeks to maintain that regime. This contention becomes considerably less plausible when we examine the subject more closely, and recognize what problems are special as well as what problems are general in the oil industry. Within the last fortnight, for example, it was announced that five major oil companies, with total assets in the neighborhood of \$1,000,000,000, had agreed on terms of consolidation. Yet if this merger is consummated, it is doubtful whether it will reduce the production of oil to any extent worth talking about. There will be conservation of oil only in those fields, if any, in which any two or more of the merging companies have been extracting oil from the same pool in competition with each other, though not in competition with any other large drillers. The new combination, however, will have to be watched just as closely as any other combination of equal size in any other industry for the fairness of its marketing methods, its business prac-

tices in competition with independent companies, and its relations with the consuming public. Monopoly of marketing, unless accompanied by strict government regulation of prices, is not to be tolerated. And as the market for oil is a world market, as much subject to foreign production and policies as wheat, such government regulation of prices is not at present practicable.

It is also important to recognize that even for companies operating in the same geographical "pool," what is called for is not a mere *permission* to the oil companies to prorate their production among them, but a governmental *compulsion* upon them to do so. Oklahoma and Texas have made a belated beginning. The plan put into effect in Oklahoma, of course, is tolerable only as a temporary measure: the wells were shut down completely by Governor Murray's arbitrary decision, and they were to be kept shut down until oil returned to an arbitrarily set price of \$1 a barrel. In Texas the extraction of oil is prorated according to the decisions of the State's Railroad Commission. As the great bulk of recent oil production has come from the East Texas fields, the new Texas law has already had an important effect on oil prices. But a better system of administration than that provided through armed troops must soon be worked out. Meanwhile the other great oil-producing States, of which the two most important are California and Kansas, continue with production unrestricted. With our constitutional obstacles in the way of Federal regulation of output, we must place our immediate hope for a rationalized and orderly oil production in a larger measure of cooperation among the States.

The Papacy Wanes

WE wonder if those timid Protestant souls who in 1928 believed that the election of Al Smith would mean the installation of the Pope in the White House are taking note of what is going on in the world. If so they ought to be cheered by the news which comes from various directions. For it indicates very clearly that the power of the Papacy is waning and with it that of the Roman Catholic Church itself. What else could have been expected? Could any one believe that a church which still believes in miracles and the superhuman could remain unaffected in a wholly changing world which has seen more than one apparently safely anchored institution swept from its moorings? Or that in an age when the world saw millions slaughtered in a needless, an utterly brutal war and men's faith died within them, any one church could emerge untainted from the catastrophe which besmirched them all?

But we are less concerned for the moment with the wholesale turning away from all churches than with what is happening to the Vatican. Slowly and surely the Roman Catholic Church's great hold upon one country after another is being broken. The collapse of the great Hapsburg Empire broke up its tremendously dominating influence in Vienna. If the church is still powerful there, it naturally suffered profoundly when the empire disappeared, its component parts were distributed by the infamous peace treaties and the whole relationship between Church and State was smashed. Similarly in Mexico it has sustained a dreadful

blow. Even though a peace has been patched up, it can never regain its lost prestige or influence—only last week two churches were burned there. No such edifice can pass through a revolution anywhere and not be affected.

Then there is Spain. While the die is not yet cast, it looks as if there would not only be entire separation of Church and State but as if there would be complete expropriation of church property. The mood of the people is evident from the fact that the needless and stupid vandalism and arson of the mob, which destroyed so wantonly, have not sent those shudders of horror throughout Spain that the clerics hoped and expected. Here Rome has only itself to blame. Farsighted statesmen and observers have long been certain that the kingdom would fall; the doubt was only as to when and how. But the church neither put its house in order, nor reduced the number of the clergy and the monks, nor gave up those extra legal privileges which for so long had exempted the clergy from responsibility for certain criminal acts. It is, however, probably too much to expect any church, whether Protestant or Catholic, to lead the way to revolution.

Then there is the Pope himself. We are firmly of the belief that the signing of the peace with Mussolini was a great tactical mistake. The Pope driving out into Rome in his beautiful and costly motor car is by no means as mysterious or impressive a person as the "prisoner of the Vatican." The fiction that he was god-like, exalted, and apart could then be maintained. Then it was easier to visualize him as the Vicar of God. But a Pope who on occasion drives forth and, yes, who speaks over the radio just like any ordinary celebrity such as a well-known American mayor travelling abroad—why that Pope can never again be as august and awe-inspiring as before he lectured to the world just before—or was it soon after?—Amos an' Andy entertained their millions. The role of the martyr, resignedly and bravely bearing his spiritual burdens and the imprisonment of his body, is the finer and more inspiring.

Finally, there is the present conflict of Rome with Mussolini. We have no knowledge as to what is really behind it all, how deeply it cuts, nor where the burden of the blame rests, nor how it will end. We only know that every such conflict tarnishes the belief that the Vatican is the seat of all wisdom and a partaker in that of the Almighty. We are impressed, too, with the comparative quiet with which Catholics and their press in this country have taken the news of this strife, and of the vandalism and the threat of the Church's disintegration in Spain. We seem to recall no swelling, resounding protests; no passionate processions through our streets bespeaking the intercession of high Heaven, no magnificent mass-meetings in Carnegie Hall or elsewhere to ask that lightnings destroy the idolators and heretics in Spain, once the home of the all-terrifying Inquisition. Is there a growing lukewarmness among Catholics here in America? It seems incredible; yet we heard but the other day a Catholic in our own profession calmly assert that now the Kaiser has gone only the Pope pretends to be the mouthpiece of God. The Pope, he averred, should profit by the Kaiser's fate and abandon all pretence of Divine Right. Strangely enough the Heavens did not fall upon this apostate. If there are regular churchgoers to speak thus now, what will be the attitude of their children and grandchildren toward the church in this most godless of ages?

The Losing Iron Horse

SCORE another dramatic victory for the internal combustion engine. The Interstate Commerce Commission has issued a certificate "of public convenience and necessity" authorizing the Delaware and Hudson Railroad to abandon its Honesdale Branch of some ten or more miles. On its face the announcement appears uninteresting; are not interurban lines going down every day? Is not the motor bus jeopardizing the existence of every trolley line in America? But when one studies this news-item a little more carefully, its significance leaps out. For this Honesdale Branch is nothing less than the pioneer steam engine railroad of the United States, opened to traffic in 1829 with the "Stourbridge Lion," an engine imported from England to haul the new "stone coals" (i. e. anthracite) from the Carbondale mines to where they could go by canal to Philadelphia and New York.

Two brothers, William and Maurice Wurtz, are credited with this extraordinary transport innovation. They had long heard from Indians that stone coal really would burn, so they built the first road to be used, on the suggestion of one John B. Jarvis, by that new-fangled and highly dangerous invention, the British steam locomotive. Others had built tramways for horses and mules and gravity roads, but it was the Stourbridge Lion, imported direct from England, which inaugurated the line on August 8, 1829—it ended exactly 102 years later. Like an old inn abandoned when the stage-coaches disappeared, the Honesdale Branch had fallen into lamentable decay, passing long since beyond the stage of shabby gentility. It no longer had any stone coals to transport; its passenger traffic had all but disappeared thanks to the motor bus and the private motor; the schedule dwindled to nothing. So it passed—the premier steam railway of America with almost none to sing its requiem.

Who can read of this without a shock? In 1905 the railroads were still masters of the situation. The new-fangled self-propelled wagon was a pretty toy for the rich to spend hours in going from one town to another over incredible roads in unbearable dust. A threat? To no one. Did one not spend as much time under the car as in it? Yet here a good quarter of a century later—the steam Iron Horse trembles indeed. Some of his employers declare that every mile of cement road helps to dig his grave. Electrical experts declare that coal as fuel must go; the Pennsylvania will soon use none between New York and Washington. Others assert that it is the same despised private motor car, so long ridiculed, which does the mischief and has struck a deadly blow at all railroad passenger earnings. Railroad presidents themselves say that these earnings will never go up again no matter how prosperous the land—gasoline is too cheap, the roads too good. So the quest for speed is on and the quest for electrical equipment and more and faster trains to compete with the airplane.

Peace be with the Stourbridge Lion! He came, he saw, he conquered. Once men bent down and worshipped. But the world moves on. Who shall say that a hundred years hence men will not smile to see a motor car upon the road as they fly their ways upon their own private wings with all the needed energy in the knapsacks on their backs?

Speaking of Revolution . . .

By HENDRIK WILLEM VAN LOON

HIS Majesty went hunting that day. That was not news, for His Majesty went hunting every day. But His Majesty killed only two deer. That was news, for as a rule His Majesty was more fortunate. His Majesty expressed his regrets duly in his diary. "Dull day. Went hunting. Two deer. Otherwise

nothing of any importance." In this, His Majesty was eminently right. Nothing of any importance had happened. In Paris a mob of half-starved people had attacked the Bastille, had murdered the garrison, and was now busy celebrating the event by a copious flow of bad brandy and worse rhetoric. But the police would attend to that in the morning. The police always did. And His Majesty yawned and went to bed. The courtiers yawned and went to bed. The royal ducks in the royal duck-ponds tucked their heads carefully underneath their little wings and went to bed. But when they woke up, King, courtiers and ducks, they all of them woke up in a new world.

Modern historical investigation is kindly disposed towards unfortunate Louis Capet. He was by no means as dull a man as many of his contemporaries had made him out. He was sluggish, but that came because he ate too much and was then in the habit of falling asleep. That same trick cost Lord North the American colonies, but no one has therefore thought of turning him into a monster of iniquity and cruelty. It is true, Louis had certain other unfortunate qualities. He allowed himself to be ruled by a young wife who wanted a life of excitement. But other and better men than he have done likewise, and they have been forgiven when people caught a glimpse of the lady's charming countenance. And then there was the most serious accusation of all, that the descendant of Holy Louis did not in the least realize what was happening—that he had deliberately closed his eyes to the ominous events of the day and refused to pay any heed to even the most unmistakable signs of the time. That, however, was not the fault of the poor, amiable potentate who started on his final flight for life with six cold broiled chickens and returned with none, so that the road from Paris to Varennes could be traced by the drumsticks and wings that had been carelessly thrown out of the windows of Count Fersen's cumbersome cabriolet. It was the fault of his grandfather's great-grandfather, who had removed his residence from the banks of the Seine to the marshes of Versailles. But if Louis the Magnificent erred when he removed the head of the country from the heart, he sinned in good company. We ourselves have done likewise. And today we pay the penalty.

There is a chapter in the history of America which has never been touched upon except in a sentimental and gene-

alogical sort of way. That is the influence of the Dutch Republic upon the newly founded commonwealth along the shores of the Atlantic Ocean. Yet it is no more than natural that the thirteen colonies, when they took their lives (individually and collectively) into their hands and set up shop for themselves, should have paid some attention to the other republics of that day, to get a line, as it were, on the republic business in general. The only "going concern" of the kind was the immensely rich Republic of the United Seven Netherlands. Many of the leaders of the rebellion had been there in search of ready cash and future credit. I leave it to some future Ph.D. to figure out how much the contemporaries of Jefferson and Madison were influenced by what they heard and read about that state of Batavian bliss. But they flattered their Dutch contemporaries by imitating the most unfortunate of all their domestic arrangements when they allowed the capital of the nation to be built at a week's distance from the center of activities.

In the case of the United States and the United Provinces, local jealousies had brought about the disastrous separation of government and state. In the case of Versailles it was the desire of security from the mob. But the results were the same. Those who should have been in constant touch with the needs and desires and aspirations of their fellow-countrymen knew least about them. The captain and the officers were never on the bridge. They merely sailed along in a little vessel of their own that drifted a couple of miles behind the mother craft. From there they signalled their orders to those on board. When an accident happened or a mutiny occurred, they were painfully surprised and genuinely disturbed. "How did this happen?" they would ask with considerable show of annoyance. But they never wanted to hear the answer. For that would have revealed the uncomfortable truth, that a separation of head and heart is apt to be just as fatal to a nation as it would be to an ordinary human being.

Of course nothing will ever be done about it. Nothing very much is ever done about anything until Providence takes a hand, and then as a rule it is too late. Besides, we are still incredibly rich and nothing is likely to happen to us for a long time to come. We will get along for the next 150 years, as we have got along during the past century and a half. But the compromise of 1790, which removed the national capital from the center of the land to the wilderness along the Potomac, will continue to cause friction and misunderstanding until we too shall have gone the way of Rome and Babylon and Samarkand. Then the White House will become another Palace of Versailles or another House in the Woods, an amiable ruin with nice gardens around it and lots of bad pictures and worse statuary and the memory of something that was very charming and very pleasant and totally futile because it had lost touch with reality—because it tried to live away from life and to rule—a thousand miles removed from those governed.

Yes, Business is terrible!

Free Trade or Protection?*

By FRANCIS W. HIRST

London, August 6

UNEMPLOYMENT and the trade depression have brought tariff problems and indeed the whole fiscal question once more into the foreground of political controversy all over the world. In the United States and many other countries, where tariff walls have been raised very high and foreign competition with domestic products, whether of the field or the factory, has been deliberately excluded, it is becoming fashionable to blame the tariff and to point out the advantages, if not of complete freedom of trade, at least of a substantial downward revision of protective duties. In countries like Australia and Brazil the growers of such staples as wool or coffee complain bitterly that the clothing and tools and machinery they have to buy are made artificially dear, while what they have to sell must be sold at market prices. Thus, allowing for freight charges, the Australian pastoralist cannot get more for his wool than it will fetch at the sales in, say, Melbourne or London; but thanks to the Australian tariff he has to pay about seven shillings for a cotton singlet costing five pence in Japan! In Great Britain, on the other hand, where free trade has been maintained (with a few exceptions, such as the safeguarding duties on motor cars, cinema films, clocks and watches, silk goods, etc., introduced by Mr. Baldwin's last administration), the fashion has turned against free trade, and most British manufacturers, with the support of the Conservative Party, are clamoring for a protective tariff on all foreign goods, with a lower tariff or preferential rebate on goods from the British Empire.

In examining the advantages or disadvantages of protecting home producers against foreign producers by means of customs duties, it would be as absurd for a free trader to point out the unpopularity of protection at the present time in many protected countries as it would be for a protectionist to argue that free trade must be a mistake because in a country like England, which has enjoyed free trade for seventy years or more, there is now a very strong movement in favor of protection. But it is legitimate, I think, before entering upon the general argument, for one who still counts himself a convinced disciple of Adam Smith and Richard Cobden to draw attention to the very general belief, expressed by a majority of leading financiers and business men in all civilized countries, that since the war the multiplication of obstacles to international trade and the raising of tariff barriers have greatly augmented a depression, which, after such a massacre of men and such a wholesale destruction of capital, could hardly have been wholly avoided, even if people had been allowed to trade freely together and to exchange their surplus products without official hindrance. And, further, as I am addressing an American audience, I am entitled to emphasize the danger of retaliation, which, indeed, has become evident during the last year. For not only has the new American tariff led to the raising of duties against leading American exports in

countries which have suffered from the exclusion of their own goods, but Canada, the nearest neighbor and, I think, the best customer of the United States, has passed a new tariff which is admittedly a serious blow to American exports.

Every free trader holds that free trade is good for a country whether other countries adopt it or not; but he also maintains that reciprocity is a wiser and more advantageous policy than retaliation, and that the advantages claimed for a high protective tariff, even if real, may be outbalanced by the disadvantages resulting from retaliatory action by other governments, which are ready to engage in commercial war and are apt to forget the Sermon on the Mount, when ruined traders or unemployed workpeople ask them to hit back. I have very little doubt that the Smoot-Hawley tariff is partly responsible for the recent growth of the protectionist movement in Great Britain. Mr. L. S. Amery, the late Colonial Secretary, perhaps the best informed and the most adroit in argument of our protectionist politicians, has been turning special attention to the fiscal policy of the United States. He has been arguing that this policy, in conjunction with the demand for war debts payable in gold, is responsible for the locking up of an unnecessarily large supply of the world's monetary gold in the United States. How, he asks, can we find a remedy for the fall in prices when debt receiving countries refuse goods and demand gold, "however little use gold may be to them, and however badly it is needed for world purposes." Mr. Amery made the mistake of prophesying that the United States was not likely either to alter its debt claims or to lower its tariff. Within a few weeks the first part of his prophecy has been falsified. But I have no doubt that people here are impressed on hearing that British imports from the United States exceed British exports to the United States by about one hundred and twenty millions sterling annually; and many who are incapable either of analyzing statistics or taking a philosophic view of trade are struck by the plausible argument that British Empire purchases from the United States could be reduced, if suitable tariff were imposed, by at least one hundred millions sterling annually. In this way, says Mr. Amery triumphantly, we should not only increase employment at home, but liberate enough gold to stabilize world prices. To those of us who believe that nothing could be more disastrous than a commercial war between the two great English-speaking nations, it seems worth while to point out to our friends in America how much damage might be inflicted by high discriminating duties on American fruit and canned meats and many other products which can be grown or manufactured (less cheaply) in Great Britain, Australia, Canada, or other parts of the Empire. If experience is worth anything at all, and if experience has already taught the losses that may be inflicted by retaliation, those who control American policy should consider whether reciprocity in advance would not be better and more profitable than the prosecution of relentless commercial warfare against good customers.

So much for the general aspects of the tariff contro-

* The first of a series of six articles on free trade. The second, ■ Free Trade and the United States, by Henry Raymond Mussey, will appear in our next issue.—EDITOR THE NATION.

versy. But before turning to the free-trade argument I would say a word or two on the subject of dumping. Dumping is a term which suggests the throwing of rubbish upon a rubbish heap, and those who desire a protective duty to raise the price of the article they manufacture usually describe all the competing goods which enter our markets as "dumped goods." Just now a good deal of moral indignation is imported into the argument by denunciations of slave labor in Russia. No doubt, in the last year especially, imports of timber, wheat, and oil from Russia have helped to depress the price of these important raw materials; but there is equally little doubt that on the whole cheap wood, cheap oil, and cheap bread are beneficial to a country like ours which is mainly industrial. Indeed, German manufacturers are now finding in the discontent of their workpeople and in the raised cost of production that their trade is suffering severely because, owing to higher taxation of imported grain, bread in Berlin costs nearly three times as much as bread in London. It is also to be observed that Russia is not mainly responsible for the present low prices of its leading exports. Russian wheat constitutes only a moderate fraction of the world's supplies, and Russian oil only a tiny fraction of the world's supply. The withdrawal of Russia from the markets of the world would certainly raise prices, but so would the withdrawal of any other exporting country.

I confess that I have not been able to discover how the use of the word "dumping" adds any serious weight to the argument for protection. It usually means no more than an underselling of competitors, which is the practice of most successful men of business! If it be defined as selling below the cost of production, that is what most big shops and stores do at the end of the season, and what manufacturers do with an otherwise unsalable surplus. But most economists will agree that when a government subsidy or bounty is paid out of taxes or loans in order to enable a particular group of manufacturers or producers to sell abroad at lower prices than they sell at home, a very objectionable and artificial state of things may result. Sugar subsidies and sugar bounties combined with high protective duties in many countries have recently produced a crisis ruinous to cultivators in Cuba and in certain other countries whose soil and climate are best adapted for the purpose. The Stevenson scheme of rubber restriction in Malaya and the coffee-valorization schemes of Brazil have proved equally disastrous; for after raising prices and so stimulating production in other countries they broke down and ended in a slump of rubber and coffee which has brought something like bankruptcy on the populations for whose benefit they were initiated.

There seems then to be no rational substitute for the natural equilibrium of production and consumption, and for those upward and downward movements of prices which attend the unhindered working of the laws of demand and supply. "Look after the consumer and let the producer take care of himself" is the best rule for governments to follow. *Laissez faire* cannot, indeed, be applied *unconditionally*, because governments, national and local, have to take care of the health and happiness of the peoples whom they represent—by laws for the regulation of health and laws to prevent adulteration and other noxious practices, which belong rather to the sphere of police than to the sphere of business. Generally speaking, it is the free air of competition that maintains efficiency in production and secures

the consumer against monopoly prices now that invention has cheapened and accelerated the means of communication and made of the whole world one great commercial community.

This brings me to the central argument for free trade. Its discovery is usually attributed to Adam Smith; but like many other modern discoveries it was foreseen and described by the ingenious speculations of Greek philosophy. I remember a few years ago at a public luncheon in Kansas City I was invited to discourse on tariff policy. I began by expressing my surprise that in a country where protective customs duties were so highly prized for purposes of foreign trade the same policy was not applied internally. If protection is good for the whole American Union, it ought, I argued, to be equally good for the individual States. But no State is allowed to protect itself against the others by a tariff, and the United States is the largest and richest free-trade area in the world. At that time the cost of a bridge connecting Kansas City, Missouri, with the State of Kansas was being supported by tolls, which protected the inhabitants from the competing produce of their neighbors on the other side of the river. Instead of rejoicing in this happy contrivance—which combined revenue with protection—the city had decided upon an issue of bonds for the express purpose of making traffic over the bridge free. I found that this illustration appealed to many of the business men present, who agreed with me that if the removal of bridge tolls would benefit both Missouri and Kansas, the removal of customs might also benefit the export as well as the import trade of the whole nation. Imports and exports, after all, pay for one another; and it is surely bad business to refuse payment. As Mr. Keynes once said (before his recent change of opinion), exports are payments, imports are receipts. All trade is barter, and the maximum of prosperity will be attained when nations and individuals accept the principle of the division of labor with the corresponding principle of the free interchange of surplus products.

These principles, as I have said, were discovered by the philosophy of Greece. In his ideal Republic Plato describes the growth of a primitive society, whose first necessities are food, houses, and clothing. At first a man living in isolation had to procure these for himself; but after joining in a community, he need no longer try to be a Jack-of-all-trades. In the very smallest village men and women would divide their labors instead of dividing their time. Some would grow food, others would spin and weave or make clothing, others would build houses, and so on. After working for a day or a week, they would barter their surplus products or bring them into the common stock for distribution. Here we have the economic justification for cooperative industry, in which men and women find scope for the diversity of their gifts and capacities. One may prefer the open-air life of a farmer, another the indoor life of a weaver, another may like to keep a shop, another to fetch and carry. Naturally, the workman who devotes himself to one occupation succeeds better. "Practice makes perfect."

As the little village community grows in numbers and wealth, there is a natural expansion of wants and services. Carpenters and blacksmiths and shoemakers and other artisans and mechanics are called into existence, until the village attains the size of a town or city. In time the city cannot supply all its own wants; imports are needed; this gives

rise to a merchant class, but they must not go empty-handed, for if they do they will come back empty-handed. Consequently, the city needs a surplus of goods with which to supply its foreign customers. Then for the purposes of exchange there must be a market place and money. So Plato shows us a complete city, with home trade and foreign trade and all the elements of that vast intricate system which, in spite of nationalism and war, penetrates and encompasses the modern world—a system of commercial and financial intercourse so complex that each one of us is dependent for his necessities, his comforts, and his luxuries upon thousands of others, not merely in his own town or village or country but on foreigners in far-away territories, for the things he uses and consumes day by day throughout his life.

But the common-sense moral which every intelligent reader must derive from Plato's charmingly written account of the growth of the city found few practical disciples. For more than two thousand years the science of political economy made no advance. Nay, in practice it went back, just as the art of road-making and of building went back after the sack of Rome and the downfall of the Western Empire. The advantages to human society of the division of labor and the free exchange of surplus products had been amply demonstrated, but commercial jealousies, racial animosities, and the natural pugnacity of mankind obscured plain truths and hindered the diffusion of wisdom and common sense. The fallacies of mercantilism induced medieval rulers to believe that trade regulations and restrictions, devised to encourage the inflow and check the outflow of precious metals, would enrich the state. Almost every government tried to divert trade from its natural channels. Then at last Adam Smith took up the principle of division of labor and used it as a key to unlock the science of political economy. After many years of study and reflection he published in 1776 his masterpiece—"The Wealth of Nations"—which ultimately induced British statesmen, through the persuasive eloquence of Richard Cobden, to repeal the Corn

Laws and to establish a system of free trade with other nations. As he put it:

It is the maxim of every prudent master of a family never to attempt to make at home what it will cost him more to make than to buy. The tailor does not attempt to make his own shoes, but buys them of the shoemaker. The shoemaker does not attempt to make his own clothes, but employs a tailor. The farmer attempts to make neither the one or the other, but employs those different artificers. All of them find it for their own interest to employ their whole industry in a way in which they have some advantage over their neighbors, and to purchase with a part of its produce, or what is the same thing, with the price of a part of it, whatever else they have occasion for.

What is prudence in the conduct of every private family, can scarcely be folly in that of a great kingdom. If a foreign country can supply us with a commodity cheaper than we ourselves can make it, better buy it of them with some part of the produce of our own industry, employed in a way in which we have some advantage.

The practical application of this today is obvious. One of America's most important export commodities, cotton, is selling at a price lower than that reached in a generation, and there is consternation at the price of wheat having fallen to the ruinous figure of twenty-five cents a bushel on the farm. At the same time discontent is seething in Berlin and the other great cities of Germany, not merely because of the financial crisis and the trade depression, but also because the German Government, to please the Agricultural Party, has clapped exceptionally heavy duties on imports of grain, so heavy that bread is said to be more than twice as dear in Berlin as in London.

England is practically the only free market for the surplus food and fruit exports of the United States. But there is no free market in the United States for England's surplus, and consequently, owing to retaliation or lack of reciprocity, American farmers are now in desperate straits. Is not the remedy obvious?

What I Believe*

By ROBERT BRIFFAULT

THE view that a man's beliefs concerning the nature of the universe determine all his other beliefs and attitudes of mind was held at one time to be self-evident. It continued to be entertained long after the practice of roasting people alive for holding wrong beliefs had been abandoned. A brilliantly written book appeared not long ago devoted to the thesis, and suggesting that the hypotheses of Professor Einstein must modify our morals.

That thesis is, I think, a relic of theological thought, which has a way of surviving in the minds of people after they have repudiated it. I am uncertain as to the nature of the ether and as to its relation to the propagation of energy, a state of mental perplexity which places me in very good company. But I cannot perceive that the doubt perturbs my outlook upon the problems which really interest me. Whether or not I believe in the ether makes not one jot of

difference to my views on pacifism, pauperism, or passive resistance. I am impressed with the magnitude of the universe and with the consequent relative minuteness of man's abode in it, but a few light-centuries more or less do not materially alter my sense of proportion, my opinions, or my conduct.

It is not my intention to be either flippant or evasive. I am aware that anyone sufficiently interested in my opinions to ask me what I believe really intends, in nine cases out of ten, to put the much more direct question with which Gretchen quizzed Dr. Faust: "Glaubst du an Gott?" As the embarrassed Faust implies in his answer, that is largely a question of previous definition. A parson desirous of pinning me down would use the word "personal." I have devoted considerable attention to the elements of psychology, and I cannot think of any aspect of human personality, such as thought, knowledge, emotion, feeling, will, justice, power, goodness, or a turn for mathematics, which does not pertain

* The third of a series of articles on this subject by well-known men and women. The fourth will appear in an early issue.—EDITOR THE NATION.

to the category of means relative to human life. To apply that category to the absolute does not make sense. Nor does any other definition. Undefined descriptions of the universal order, or disorder, scarcely make, as regards the vital questions of human life, a difference greater than does the existence or non-existence of the ether.

Nor can I perceive that those vital questions are affected by my believing, as I do, that the distinction between "matter" and "mind" rests upon an elementary confusion of thought. It is true that many seemingly important consequences as to the nature of life and death depend upon that view, and that nine-tenths of the controversies about materialism, behaviorism, and idealism are reduced thereby to meaningless gibberish. But it leaves my human relations and my motives essentially unaffected. As a young man I used to take a keen interest in metaphysics. I am thankful that I did; I believe it has helped me to think more clearly. But as I have grown older I have come to see that the importance attached to those questions has been exaggerated. Views about the universe are inevitably patterned on human life and human relations. They are necessarily either anthropomorphic or materialistic, and consequently, in each case, absurd. No tolerable description of enduring bliss, for example, has ever been given, because such a condition is outside human experience. And every belief concerning the nature of the universe derives, after all, its sole significance from the influence which the universe may be supposed to exercise upon the life and the world of man. From that world of his, man cannot escape. He is not even capable of conceiving death—an incapacity which has been termed an intuitive faith in immortality. The closer I draw to death, the more I am interested in life, which is the only thing that anyone is really interested in, however much he may persuade himself that he is interested in the universe.

Opinions concerning the constitution of the universe were very important when human life, viewed as a brief period of probation, was accounted unimportant. As the importance attached to human life has become greater, that of the universe has grown less. The inevitable effect of otherworldliness was to dull the edge of man's concern with the human world and to foster acquiescence in its injustice and stupidity. That deplorable attitude is expressed in the most immoral principle that has ever been uttered: "Resist not evil." What moral advance over its predecessors can be claimed for the present age—and despite the survivals of medievalism a good deal can be claimed—has not come about through the principles of the Sermon on the Mount, but through the opposite tendency to resist evil, tooth and nail, without reference to the constitution of the universe, but with growing insight into the constitution of the human world.

Whether man be regarded as the work of God, or of the devil, or of natural selection, or of the continuity of the germ-plasm, the human world has definitely come to be viewed as the work of man. To lay the blame elsewhere is unjust, and to pray for rain or for peace has come to appear foolish. The world of man is, according as we look at it, an amazing and glorious wonder or an atrocious nightmare. In the Middle Ages the atrocities of the human world were set down to the depravity of human nature. The achievements which distinguish my world from that of my cannibal ancestors are the outcome of stupidity. I am convinced, in

spite of all that may be said on the subject of the limitations and fallibility of reason, that the stupidity which causes the atrocities of the human world is not an irremediable part of the nature of man. Many people tried quite lately to make us believe that war is due to an instinct of combativeness innate in human nature, and therefore inevitable. That, I believe, is not true. A highly organized and complicated technique of propaganda, the resources of oratory, the assistance of the police, the cooperation of academic learning, of the churches, of the press are required in order to wheedle the collective combativeness of twentieth-century man into facing a machine-gun. Were it not so, no existing institution which excites his exasperation would be safe for a day. As with war, so with other atrocities of the human world. The propagandas of politicians, professors, the pulpit, and the press do not rely for their success upon human intelligence. They rely upon the intellectual trickery which is concerned with the safeguarding of established institutions by appealing, not to facts, experience, or logic, but to the authority of established traditions. Those traditions and those institutions have for the most part been handed down from a time when savages were imperfectly intelligent. They derive their sanctity from the fact that every established institution supplies persons associated with it with bread and butter and a little over. Were it not for those vested interests and that propaganda, no intelligent person at the present day would, I believe, advocate war, or the organization of industry without reference to human needs, or the deformation of the minds of children by inculcated superstition. Those opinions upon which are based the atrocities of the human world are not dispositions of human nature, but products of education in savage traditions.

The old doctrine that it were better for a man to be dead than to hold erroneous views in astronomy was an odorous herring drawn across the trail of the most fateful issue that bears on the destinies of man's world. What is vital is not what a man believes, but why. Savage humanity held irrational beliefs concerning the methods of obtaining and of cooking a meal. It accounted indispensable to the success of the operation the aid of supernatural agencies acting unnaturally and irrationally. Modern humanity has largely outgrown that primitive irrationality. It believes that natural agencies and common sense are alone effective in providing a dinner. Savage irrationality has accordingly withdrawn from the field and the kitchen, the market place and the factory, and taken refuge in the metaphysical universe. That is why transcendental beliefs are deemed important. In a sense they are. He who holds the irrational beliefs of the savage with reference to the universe is likely to hold equally irrational beliefs on political, social, moral questions. The views of the Pope or of the Methodist Council on astronomy, biology, or metaphysics matter little. Their views on policy, on marriage, on education matter so much that the world's destinies, which hang perilously in the scales, may be determined according as the balance is turned by the weight of rational or of irrational opinions. Before the human race is fitted to cope effectually with the political, social, economic, and moral riddles which it must answer or be torn to pieces, traditional beliefs concerning the constitution of the universe may have first to be set aside, not because the constitution of the universe is of importance, but because the constitution of the human world

depends upon the measure in which the thought of man is able and willing to operate honestly, fearlessly, and in conformity with facts.

One of the most stupid principles, and certainly the most pernicious, of our current tradition is the doctrine that all beliefs that are held sincerely are equally entitled to respect. Nine-tenths of the atrocities which convert the human world from a glorious achievement into a ghastly horror are the result of sincere beliefs of good men and women. Those sincere beliefs have plunged the world into misery and deluged it with blood. I have no respect for them. The principle is, of course, merely a device for the protection of traditional stupidity. Were it once admitted that the only criterion of the respectability of a belief is its validity on rational grounds, the difficult task of safeguarding irrational traditions would become hopeless. Repudiating as I do that protective device, I am intolerant. I am shamelessly intolerant of typhoid, tuberculosis, war, social injustice, superstition. I am likewise liable to become impatient when, in regard to any of those evils, I am asked: "What do you propose to put in its stead?" Fortunately, my conviction that tuberculosis, and militarism, and stock-jobbing, and superstition are not innate and inevitable prevents my intolerance from extending to persons who are afflicted with those infections. That a man is a consumptive, a millionaire, or a Methodist is not his fault. It is the fault of primitive insanitary conditions, bodily and mental.

Believing as I do that human nature is not incurably stupid, militaristic, superstitious, submissive in the face of injustice, I am in the rare and fortunate position of being an optimist. The times are particularly favorable to optimism. The world-wide depression and unrest, the dissolution of the economic system, the political chaos which bodes imminent war, the intellectual chaos that stultifies the greater part of current thought, the disintegration of the family, the impotence of art, the collapse of religion and of morals are so many signs calculated to encourage optimism. They betoken, one and all, the final collapse of the authority of savage traditions, that is to say, of the causes of human stupidity. They do not hold out the promise of any Utopia. Far from it. But they render inevitable a radical change in the working of the forces which have hitherto misshaped the human world.

The situation has never occurred before. The human world has proceeded up to now on the principle that tradition, whatever its origin, is the most respectable sanction for beliefs and conduct. The obsolescence of that age-long foundation amounts to much more than any revolution. It is comparable only with the emergence of the race out of brutishness.

Never was what we believe of greater importance than today. If we believe that savage traditional institutions are immutable and everlasting, these are very appalling times. If we believe that wisdom consists in performing balancing feats on the fence of compromise, these are very perplexing times. If we believe that the logic of human intelligence and of events moves inevitably, like the sun on the map, from right to left, and can never be bidden to stand still, these are very interesting times in which to be alive. Upon the proportion of those beliefs today depends the severity of the birth-pangs amid which a new age shall be born out of the old.

The days in which we are living closely resemble the Day of Judgment: everyone is compelled to take sides, to sort himself out with the sheep or with the goats. The choice of every thinking man and woman is between the thoughts, standards, values, and aims of a world to which history is waving an everlasting farewell and those of a new world where the feet of the younger generation are set upon other paths. Some try hard to elude the behest of the trumpeting angels and the painful necessity of making a choice. They are called liberals. I am not a liberal, because to try to make logic stop short of its extreme conclusions seems to me as futile as to attempt to poise a stone in mid-air. I believe that it is too late for human thought to avert the nemesis which traditional stupidity and the interests vested in maintaining it are calling down upon the semi-civilization of the West. I believe that any form of compromise is today a waste of time and energy.

I know the perils and the penalties of rejecting compromise. To incur those perils seems to many injudicious. That again is a misconception of human nature. The most potent urges that drive man and other forms of life are perilous and prejudicial to the individual. Whenever a human being sets about enjoying himself, he acts injudiciously: his bank account suffers. Love, art, truth are profoundly injudicious. To feel an interest in the fate of unborn generations is injudicious. Yet those injudicious urges are the only ones for which human beings have been prepared to lay down their lives. The reason is that the individual is, biologically speaking, but a by-product of a continuous germ-plasm which does not care a straw about the individual's interests and perils. According as *its* impersonal urges or the interests of *his* bank book are obeyed, two divergent philosophies of life are formulated. The one is prejudicial to the individual; the other is prejudicial to the race.

But it is the race as a whole, and not the individual, which has been developing since savage times, and with that development the two philosophies of life come to diverge less and less. The truth has lately been forced upon the world that for a nation to pursue its own apparent interests without reference to the interests of other nations is a circuitous method of committing suicide. The truth is being also forced upon the judicious individual that the exclusive pursuit of what he deems his interests may in the end prove suicidal. Thus morals are being gradually inculcated, not by moral sermons and mystic exaltations, but by the pressure of facts—a much more effective method.

The process, which has been at work since man emerged out of brutality, will go on whatever beliefs, whatever theories may be in fashion. Truth triumphs in the end, not because of some magic power it wields, but because irrational beliefs and false philosophies are merely a perverse habit which human beings have of kicking against the pricks. The results of such kicking are unpleasant, tedious, and messy. The procedure prolongs the agonies of adaptation. That is why it is better to keep a severe check on our beliefs and opinions; that is why intellectual honesty is the best policy.

The thinker is a conceited person. He is prone to imagine that he fashions the world. All he can do is to shorten the futile and unpleasant process of kicking against the pricks. That, in reality, is the badly paid service which he renders to mankind when he obeys the cry that goes up from a distressed world—the cry for reason and justice.

The Admirals See the Point

By H. K. FLEMING

REPRESENTATIVE BRITTEN now is more than sixty years old and a great patriot. In circles where patriotism is a fine art he is ranked only a little below William B. Shearer, about on a level with William Hale Thompson, but a little above Rear Admiral Fiske and Mrs. Broussard, of the Daughters of the American Revolution. In any event, the Representative's technique in denouncing King George has proved most effective. As chairman of the very powerful House Committee on Naval Affairs he has been in a convenient position to do this; and with a large army of German constituents back home in Illinois, he has found it in the past politically profitable. So bellicose and influential has he been in naval matters that he was able to maneuver the army-navy game to Illinois with the same facility that he was able this month to shift the North Atlantic fleet and the Los Angeles to Long Island.

It was these latter feats that revealed that, patriotically speaking, the Representative moves in circles that are not likely to be approached even by Mr. Shearer and Mr. Thompson. Singularly enough, a pacifist was responsible for it all. Frederick J. Libby, of the National Council for the Prevention of War, with headquarters in Washington, had been making speeches on Long Island in favor of peace recently. Mr. Britten thereupon discovered that the youth of Long Island was being corrupted. Mr. Libby, he said, was an "international anarchist." His answer was decisive. He went to Admiral Pratt and suggested that the North Atlantic fleet, comprising about thirty-five vessels, and 5,000 men with a pay roll of some \$1,000,000, be transported to Montauk Point, Long Island, to revive the fires of patriotism. The Admiral, who knows his master's voice when he hears it, fell into line, and so at the isolated village of Montauk, far removed from the centers of population and 160 miles from New York City, there gathered Lawrence Richey, secretary to President Hoover; Ernest Lee Jahncke, Assistant Secretary of the Navy; David S. Ingalls, Assistant Secretary of the Navy for Aeronautics, and Rear Admiral Moffett, to watch the taxpayers' vessels sail into Montauk Bay. Another visitor reported was Mr. Ivy Lee.

It was in this distinguished company that Mr. Britten made his remark about Mr. Libby; and there also, although only by chance, was it discovered that Mr. Britten was the owner of three and a half acres of land at Montauk, and that he was a friend of long standing of Carl Fisher, the genius of the Montauk Development Corporation, which had sunk many millions into the venture; \$10,000,000 appears to be a conservative estimate. Mr. Fisher, whose talents had been exercised previously at Miami Beach and the Indianapolis speedway, began to develop Montauk in 1925, but Mr. Britten, on his own admission, did not enter the picture until two or three years after this. The day following the discovery of the three and a half acres, the Representative conceded that he was a stockholder as well as a landholder. He had denied this when questioned at first, but possibly it was a lapse of memory. However, on one point he remained adamant. His financial interest in

the place was purely a coincidence. It was the perfidious Mr. Libby he was after. There was the real reason.

No one who has worshipped at the shrine of Messrs. Thompson, Shearer, and Fiske, and Mrs. Broussard will for a moment doubt that the Representative's gesture was directed toward the youth of Long Island, fifty to a hundred miles away in the interior or down the coast, and not to his own pocketbook. In high naval circles his word is gospel; he crooks his finger and the fleet moves; he expresses a wish, and the Los Angeles sails. The only source of interest for historians is what the Representative chooses to call a "coincidence." It might indeed be termed a series of coincidences. Back in 1927 Montauk was being mentioned as a village that was yet to be heard from. Its bay undoubtedly was magnificent; and should ocean liners make it a port of call, the voyage could be cut by no less than twelve hours.

It was in December of that year that this thought occurred to Clinton Bardo and Laurence Wilder, of the Brown Boveri Corporation, who will be remembered chiefly for their employment of Mr. Shearer to "spike" the Geneva naval conference. Messrs. Bardo and Wilder had organized the Transoceanic Corporation, which was to run a fleet of four-day vessels across the Atlantic provided they could get the United States Shipping Board to accommodate them by a loan of \$100,000,000. Montauk, they decided, would make an ideal port. It was about this time that Mr. Britten secured his land.

Other interests also had not been slow to foresee possibilities of vast profit. W. W. Atterbury, president of the Pennsylvania Railroad, reasoned with logic that the Long Island Railroad, one of his subsidiaries, would carry every pound of freight and every passenger to and from Montauk; and we find George LeBoutellier, vice president of both the Pennsylvania and the Long Island Railroad, buying heavily into the stock of the Montauk Development Corporation, later becoming its president. By a "coincidence" Mr. Atterbury's sentiments were expressed to the Representative himself in a letter given to the press by the latter, April 1, 1928. The Transoceanic Corporation's request for \$100,000,000 from the public treasury was then pending before the Shipping Board. As a sort of introduction to the letter Mr. Britten explained that he had been making, to quote the *Herald Tribune*, "investigations to ascertain if any of the great railroads were inclined to cooperate with private ship-owners in the interest of economy in overseas passenger and freight transportation," adding that he looked for "the inauguration of the four-day ships across the ocean." The Atterbury communication synchronized curiously, fortunately, and almost exactly, with what he had been looking for. Mr. Atterbury was willing and ready to cooperate; Mr. Atterbury extolled Montauk. Its bay, he found, was unrivalled. To the Transoceanic project he gave his blessing. Thus the stage was set carefully for a record grab of \$100,000,000, but unfortunately the Shipping Board frigidly dismissed the plan on April 27—on the ground that it was unsound and "financially nebulous."

Equally unfortunately, that other great patriot, Mr. Shearer, then revealed what had been going on backstage. Mr. Shearer sued the Brown Boveri Corporation for a large sum on the ground that his heroic services at the Geneva naval conference had gone unrewarded. As a result Mr. Bardo was called before a Senate Committee and revealed that \$102,000 had also been expended in lobbying and securing publicity for the Transoceanic-Montauk project. Of this sum \$6,750 had gone to Mr. Ivy Lee, also public relations counsellor for the Pennsylvania Railroad, and some \$3,800 to Herbert Hartley, former commander of the *Leviathan*, then being operated by the Shipping Board, who was induced to resign his command and use his influence on the publicity payroll. The commander, in fact, left his ship in January, 1928, and as early as February of the same year was loud in his praises of Montauk. Two months after the Shearer suit, Mr. Hartley also sued the Transoceanic Corporation for \$75,000. He, too, complained that Shearer had "spilled the beans" and therefore his pay had ceased.

Mr. Britten's corporation was now left high and dry. There was no longer a flood of publicity from more than a score of spellbinders on the Transoceanic payroll. There was even danger that Montauk would be forgotten completely. For a time it seemed that the bid of \$16,000,000 made by Paul Chapman and Joseph Sheedy, which won them the vessels of the Shipping Board early in 1929, might result in Montauk's being made a port. Shipping circles were of the opinion that this huge bid, many millions above that of the nearest competitor, was made with this in mind; Mr. Sheedy was reputed to be a former associate of Mr. Fisher's; and enquiries at the Pennsylvania Railroad brought the discreet reply that such an eventuality was probable. But nothing came of it. Nor had anything come of the alleged interest shown by other steamship lines.

What was to be done for this \$10,000,000 development? Land had been exchanging hands there during the days of optimism at from \$20,000 to \$250,000 an acre, if reports are to be believed. It was then that Mr. Britten, the most influential member of the great deflated, came to the rescue. On September 22, 1930, he announced publicly that Montauk Bay had unlimited possibilities, and that "if American steamship owners continue to be indifferent to the fact they will wake up in the near future to find that foreign countries have stepped in and established a base." "Some people throughout the country when they read this statement will contest the practicability of using the bay as a port of entry on the ground that there is not enough deep water," he continued. "As a method of proving that this statement is not based upon theory I will have a practical demonstration enacted by the United States navy. As chairman of the committee of Naval Affairs I will guarantee to the sceptical minds that they will see one of the United States naval fleets using the bay . . . and when they see the huge battleships anchored in the bay they will agree with my contentions."

This month, therefore, the fleet with its \$1,000,000 payroll and its 5,000 men duly arrived to act as a signboard for the Montauk developers. The handful of men who took the trouble to land on that exclusive and isolated spot paid \$2 a meal at the Fisher-Britten hotel, Montauk Manor. Others paid twice what they would have paid in New York at so-called cheaper places down the beach. In nearby Southampton, hotels were asking from \$8 to \$18 a night;

the taxicabs charged up to \$1.25 a mile, and the few hundred sailors who could afford to get into Riverside Drive and Broadway, New York, used Mr. Atterbury's railroad at about \$6 the round trip.

The Representative had wasted no time in getting to work. On the first day of the visit he had impressed upon newspaper correspondents the "possibilities of the bay as a potential deep harbor for commercial shipping"; but as the storm broke he answered criticisms with explanations that were bewildering in their variety. By turns he became petulant and belligerent. "Frederick J. Libby has been making speeches all through here which are destructive in their attitude," he said. "One of the main objects in bringing the fleet was to counteract this propaganda." Some of his other explanations follow:

(1) "Officers don't like it because they are not having their daily tea in Newport. There's not enough doing here."

(2) "This is a good place for the fleet because the climate is better than Newport."

(3) "I think the ships should go where the people can see them, popularizing themselves."

(4) "There is nothing commercial in bringing the fleet here."

(5) "The force has the advantages of a deep water harbor and a land location which while not densely populated is near enough to centers of population so that the public can come and learn something of a navy training program."

(6) "I like dancing and teas and have no complaint against officers having social contacts, but I firmly believe the fleet should have as much cruising time as it can absorb."

But it was after the fleet had steamed out of the harbor that the Representative delivered what he termed his final "statement to the world":

"In December of 1930, after the American Motor Boat Association had announced the twenty-eighth annual motor boat classic was to be raced on Lake Montauk, August 15, I called up Secretary Adams and Chief of Operations, Admiral Pratt, to suggest that Fort Pond Bay (Montauk Bay) be included in the fleet's schedule of summer operations in the triangular area bounded by Newport, London, and Montauk . . . It was later determined by the Navy Department without the slightest political pressure or suggestion from me or anyone else that the fleet's itinerary should include the week of August 10 at Montauk."

This final explanation can be dismissed as frigidly as the Shipping Board dismissed the drive for \$100,000,000 of the public's money. It is intimated here that the visit of the fleet was to be in the nature of a "tie-up" with the motor boat races, but it so happens that these were not announced until October, 1930; and in September, 1930, the Representative had said he would "guarantee" that the fleet would be in Montauk, but for quite a different reason. And if there was no evidence of "political pressure" how is it that the Representative can make his "guarantee" in September and not until December "suggest" to Admiral Pratt that the fleet come to Montauk? How is it that the chairman of the Committee on Naval Affairs can shift the taxpayers' fleet about in this manner? There is only one answer. The Navy is afraid of him; and for Naval officials the Representative has apparently the same contempt that he has for the intelligence of the public.

In the Driftway

IN his college days the Drifter managed to pick up a smattering of such economics as was going the rounds then, and he still recalls with pleasure the marginal theory. The marginal theory held that it was always the last unit or units of a commodity that really counted. They were the units that determined the price of all the rest. For example, if A, B, C, and D each wanted to sell E an orange, they could get for each orange only as much as the fourth orange was worth to E. Or, to be more realistic, if the South has some twenty million bales of cotton to sell, the price it can get for each bale will not be any higher than the price at which it is able to get rid of the last five million bales—or even of the very last bale. Now it seems to the Drifter that the marginal theory has a much wider bearing than the text-books used to hint. European critics, for example, have been telling us for years that we spoil our women, that the American husband is a slave to the American wife, and so on. But have any of these foreign critics stopped to ask themselves *why* this condition exists? (Let's assume that it *does* exist, or we can't go on.) As the Drifter sees it, the whole explanation lies in the census figures. These show that in the United States there are still 102.5 men to every 100 women. It is those extra two and five-tenths men, those marginal boys, who are causing all the trouble. They are going around trying to get themselves married, underbidding the rest of us, making all sorts of ridiculous concessions, and in general demoralizing the man market. In England, as everyone knows, the situation is reversed; there are about 109 women there to every 100 men, and so the men can afford to be tyrannical, unchivalrous—in fact, to dictate their own terms. Monogamy may work out ethically, but it surely doesn't work out statistically. Incidentally, the Drifter has just learned what is meant by the phrase: "Not a Chinaman's chance." There are 394.7 Chinese males in this country for every 100 Chinese females.

THE DRIFTER

Correspondence

"Justice" in Kentucky

TO THE EDITOR OF THE NATION:

SIR: I have just visited one of the mining regions of Kentucky. In the Harlan County jail I visited with an old friend who is now in the clutches of "the law." Arnold Johnson was previously Sherwood Eddy's secretary and is now preparing for the ministry at Union Theological Seminary. From Dr. Eddy and seminary professors he caught a glimpse of the meaning of religion in economic life and decided to spend his summer doing relief work and other forms of helpful service with the miners of that county, who are on strike against intolerable conditions. Wages are low, employment is irregular or unobtainable, high prices are charged at company stores, underweighing at the scales is not uncommon, and misery is widespread and abysmal. Yet when the miners under these circumstances strike for better treatment, they are looked upon as dangerous characters. They are terrorized by armed strike-

breakers and private guards and sometimes even by officers of the law. Several miners have been shot from ambush, their automobiles have been dynamited, their leaders have been kidnapped, brutally beaten and taken across the State line, with warnings not to return. The miners are therefore in a bitter and reckless mood. Many of them go armed constantly and are prepared for direct action. The conservative United Mine Workers union in this section has largely been supplanted in influence by the I. W. W., and the militant Communist organization with its gospel of class hatred and violence.

Mr. Johnson came into this region as a representative of the Fellowship of Reconciliation and the American Civil Liberties Union, for the purpose of siding with relief work and the effort to secure justice for the miners. He was soon accused of being an organizer for the I. W. W. and warned by "operators, judge, and sheriff" to get out of town. When he refused to be intimidated, he was arrested on a charge of criminal syndicalism, that is, advocacy of the violent overthrow of the Government. The evidence produced in court to prove this charge is utterly ridiculous.

A room which he had formerly occupied was searched and some of his papers seized. I was permitted to examine the literature which was supposed to prove his guilt and made a complete list as follows: a copy of the *Survey*, March 25, 1922; a copy of the *League for Industrial Democracy Monthly*, June 1931; a copy of *The Unemployed*, Spring 1931, published by the League for Industrial Democracy; a copy of "Mr. Justice Langdon Dissents," a new chapter in the Mooney-Billings case, published by the Arbitrator Press; a copy of "National Defense," by Kirby Page; a copy of "Southern Labor in Revolt," with a foreword by Norman Thomas, published by the Intercollegiate Student Council of the League for Industrial Democracy; a copy of "Even Adam Had a Hearing," published by the Committee on Labor Injunctions, organized by the American Civil Liberties Union; a copy of "Gastonia," published by the Conference for the Progressive Labor Organization; page 2 of a mimeograph report of the American Civil Liberties Union, June 4, 1931; two private letters; and a copy of "What do you mean—Free Speech?" published by the American Civil Liberties Union.

The last of these pamphlets contains a passage which was the prosecutor's trump card. Primarily on a basis of having in his possession the following words, Arnold Johnson is behind prison bars as an enemy of society; "Therefore, it is perfectly clear that orderly progress can be achieved only by unlimited free speech. No man should ever be locked up for what he says,—even if he advocates overthrowing the government by violence, or advises the destruction of property. Let him spout any foolishness he likes. The time to lock him up is when he actually starts to do something. If someone who hears him takes his advice and starts something, lock them both up."

No effort was made to prove that Johnson had advocated the violent overthrow of government, nor even that he had circulated literature which advocated the use of violence for this purpose. Solely on the charge that he had in his possession the literature listed above, he is being held for the exorbitant bail of \$10,000, half of which is appearance bail and half peace bail. Excessive bail is one of the weapons being used against the miners.

The domination of the region by the coal operators includes unwavering support from their hired men who are elected as sheriffs and judges. Thousands of men throughout Kentucky, West Virginia, Pennsylvania, and other coal regions are victims of even more flagrant miscarriages of justice than that of which Arnold Johnson is the victim. What do those persons who believe in justice and fairplay propose to do about it?

Pattern of Summer

By FRANCES M. FROST

When dusk revolves about the horizoned earth
That runs to meet the steady
Onflow of stars, the forsythia sap that spiraled
Through naked branches now in a sudden heady
Shower of gold drips groundward.

The secret frail leaves breaking on the tree,
The new nest dark to the cool, inconstant wind,
Moved into summer as inevitably
As into night, and slowly left behind
The closed, tight buds, the clear, delirious bird
Capsized with love, who, hushed and voiceless now,
Broods in the sweet nest heavy on the bough.
And women turn

In the darkness toward their men, the growing child
Stirring within them . . . and those fires which woke
In the holy, furious Spring, now quieted,
Burn deep within the waiting breast receiving
The dark, desired head.

Postscript

The World of Light. A Comedy in Three Acts. By Aldous Huxley. Doubleday, Doran and Company. \$2.

The Cicadas, and other poems. By Aldous Huxley. Doubleday, Doran and Company. \$2.

WHEN I reviewed here two weeks ago "Music at Night," Mr. Aldous Huxley's volume of essays, I did not realize that within a few days there would arrive a play and a book of poems by the same author. The incident might give a false idea of Mr. Huxley's productivity, for the lag between composition and publication is not a uniform one, and "The Cicadas," at least, turns out to be merely the "trade" publication of a volume of poems issued two years ago by The Fountain Press in a limited edition under the title of "Arabia Infelix." In the new volume the poems are re-arranged—for the better, I think; for the present book opens with Theater of Varieties, a much more memorable and a much more Huxleyan poem than the rather conventional Arabia Infelix. Mr. Huxley can never be a poet of profound feeling; he writes too much merely with his mind; and though he can occasionally achieve a lovely image, the body of his verse, in sentiment as well as in technique, remains too close to the traditional. His strongest vein is either that of satire, as in the Theater of Varieties just referred to, or, as in The Cicadas, that of biologic and philosophic speculation.

"The World of Light," I believe, is Mr. Huxley's first play. He has approached his task in a humble and workmanlike manner. So far from attempting any technical innovations, he has tried to do everything that would gratify the ghost of the late William Archer, or even a theatrical manager. There are only eight characters; there is one scene throughout; the first act ends with a crucial decision, the second with a crisis, and the third with at least some untying of the knot. Hugo Wenham, fed up with trying to make Cambridge undergraduates understand Plato, and also because he wants to avoid

marrying Enid Deckle, whom he merely likes, suddenly leaves with his friend Bill Hamblin for Guiana. They take an airplane with them, and Hugo's father receives a telegram that the plane has been found wrecked in Haiti. Then his father and Enid begin to receive messages, through a young medium, Hubert Capes, from Hugo's spirit. Guided by these messages, Hubert and Enid become physically as well as spiritually intimate; and Hugo's father writes a book on spiritualism that becomes highly successful. Unfortunately, however, Hugo and Bill have not been killed, and suddenly return in the midst of a seance. Hugo's problem then becomes that of all prior Enoch Ardens.

"The World of Light" is a less remarkable play than one would expect from its brilliant author; it cannot be compared with the best of his novels or short stories. But it is a highly competent play, and, what is always rare and refreshing in drama, it ventures intelligently and wittily into the realm of ideas. Perhaps later, when Mr. Huxley is more accustomed to the medium and less absorbed by the purely technical problems it involves, he will give us something that excels it. Meanwhile his versatile example, and his courage in trying his talents in so many directions—the novel, the short story, the essay, the travel book, the sociological study, and now the drama, can only cause one to lament once more the narrow specialization and unadventurousness of most of our own leading writers. For in his versatility Mr. Huxley is merely following the tradition already established by such British writers as Shaw, Chesterton, Galsworthy, Arnold Bennett, and even minor authors like Eden Phillpotts. Here no such tradition exists. Our poets, Frost, Jeffers, Robinson, attend pretty strictly to their poetry; our novelists, Lewis, Faulkner, Willa Cather, Hemingway, keep to their fiction; our one important dramatist, O'Neill, never ventures outside of playwriting. More dangerously than in business and medicine, we have been developing in literature a habit of specialization. Its existence accounts at least partly for the fact that British literature is still richer than our own.

HENRY HAZLITT

When Sin Was Sin

Old Bowery Days. By Alvin F. Harlow. D. Appleton and Company. \$5.

OF course the Bowery had its sylvan period. Mr. Harlow describes it, as he does the street's other phases. But it was not the bucolic period, when our hero was a country lane through Dutch farms, that made the Bowery famous, and Mr. Harlow's admirable chronicle does not reach its most vivid pages until the street becomes the roaring, riotous, flaming highway that it was between 1880 and 1900.

"The liveliest mile on the face of the earth," H. C. Bunner called it then. It was all of that. Probably it was the liveliest mile that ever has been on the face of the earth, and maybe the liveliest mile that ever will be. Every great metropolis has its Wall Street, its Broadway, its Fifth Avenue, its Park Avenue, but there never has been but one Bowery and—one reflects with a little melancholy—there never will be another. For the Bowery was in a peculiar way the creation of its age and its country. It was the urban florescence of a mighty continent in a day when the rest of it was largely one widespread, flaming farm; it was the culmination of the immense vitality, exuberance, and joy of a pioneer nation that suddenly had found itself great; it was the melting pot at its highest temperature, at the moment of its greatest variety, color, and ebullition.

The Bowery was the meridian altitude of that "rugged

individualism" which, with due disrespect to Mr. Hoover, has ever since been on the wane; which has been sinking inevitably to a horizon of mass control and organized uniformity in which men become sober and joyless in order that they may be more efficient.

The Bowery in its heyday was the street of scores of those remarkably individualistic persons in whom the last days of nineteenth-century America were so rich—of Steve Brodie and his famous song, "My Poil Is a Bowery Gail"; of Dry Dollar Sullivan, that lovable friend, exploiter, and corrupter of the poor, who characterized the members of the City Club, with their efforts at reform, as "silk hats and silk stockings with nothing in between"; of that superb ruffian Big Bill Devery, the "finest police chief New York ever had"; of Chuck Connors, the Mayor of Chinatown; of Eat-'em-up Jack McManus, the bouncer of Suicide Hall.

But the Bowery was not only the culmination of "rugged individualism" in America; it was also one of the last, most bizarre products of the gospel of good and evil, which in our day has been superseded by the religion of work. The psychologists have done more to lay the ghost of the Bowery than the City Club. The Bowery flourished in the day when sin was sin; when evil was something you could get your teeth into and enjoy. Now that we have learned that the only difference between good and evil is in the spelling, there is no kick in either. The Bowery knew how to sin lustily, joyously, believably—in unflattering contrast to our tiresome night clubs and insipid gin parties. We are a generation of tired sinners as well as tired radicals. And if sin hath lost its savor, wherewith shall it be made potent?

Perhaps our only hope is to enjoy it in retrospect, to relish it vicariously in such fascinating pages as those of Mr. Harlow. Read 'em . . . and laugh . . . and weep.

ARTHUR WARNER

The King Is Dead Long Live the King

The Volga Falls to the Caspian Sea. By Boris Pilnyak. Translated from the Russian by Charles Malamuth. Cosmopolitan Book Corporation. \$2.50.

LIKE his great Russian predecessors, Pilnyak essays the true function of the poet. Not content with telling a simple tale, exposing a few superficial eccentricities, dissecting a few emotions, preserving a few lyrical moments, he attempts to weave a net which will catch in its meshes the startling new confession of life that is being made in Russia today. He is most like Dostoevski in his apparent formlessness within his carefully wrought form, in the confused and supposedly profound speeches of his characters, in his symbolism, in his way of seeing people as Dostoevski saw them, almost, one might add, of taking Dostoevski's very own people out of his Russia and putting them in Pilnyak's, the repulsive counter-revolutionary Skudrin being the blood brother of the elder Karamasov. But with these borrowings the resemblance ceases. Pilnyak wholly lacks Dostoevski's marvelous gift of poignancy, of making preposterously incredible people more real to us than our own friends, of conjuring up all the emotions and thoughts that have sustained and harassed man.

He tries magnificently, but the reader stumbles and totters along behind, never more than half implicated in his tale, for his book, like the great monolith at Kolomna that is to turn the Moscow river out of its course, destroying old towns and building up new, destroying old ways of life and creating new, is a "construction." Life is never really breathed into it. If

Pilnyak had Dostoevski's talent for seeming real, it would not so much matter that his main story is as appalling in its implication as it is naive, and that the true symbolism, which Goethe, it will be remembered, described as arising "wherever the particular represents the general, not as dream and shadow, but as a living and instantaneous revelation of the inscrutable," is continually giving way to a childish trick symbolism by which counter-revolutionaries are represented as ugly, diseased, distorted, malicious, or wicked, and true Communists as angels of light. The numerous invocations to geology do not distract our attention from these essential weaknesses of the book as effectually as would a small dash of Dostoevski's magic.

The book's hero is the elderly Professor Pimen Sergeyevich Poletika who has designed the monolith, and whose wife Olga left him fourteen years ago to live with Lazlo. Arriving at the site of construction, he finds that Lazlo is now an engineer there, and that Lazlo's second wife Marya hanged herself the night before. For years Marya, Chief Engineer Sadykov's wife, had been Lazlo's mistress, although he devotedly loved his wife Olga. In permitting himself an emotional foray with a mistress, he is represented as doing only what most men in Russia do. Yet a month before the story begins, Sadykov accuses Lazlo of improper relations with Marya, saying that since he persists in the affair, Communist morality demands that he marry her. Sadly Lazlo agrees that he must leave the wife he has loved for fourteen years, abandon his child, and take his friend's wife away from him. Sadly he tries to conceal his sacrifice from Marya, who perceiving it, kills herself.

On the day of Professor Poletika's visit to the works, all the women, their spirits goaded by the many sexual outrages they themselves have had to endure in a camp where the men greatly outnumber the women, march as a protest to Marya's funeral, and then demand the boycotting of Lazlo by all good Communists. A Communist in Russia boycotted by all good Communists is done for, and Lazlo obligingly takes himself to that exact spot on the flooding meadows where a group of insane and wicked counter-revolutionaries have gathered to blow up the dam, and gives them a revolver with which, in an access of contrition, they kill themselves and him. Meantime the good Professor Poletika, who has "replaced eternity by cheerfulness and construction," retakes to his bosom his wife Olga, and the good engineer Sadykov confesses to Poletika's daughter, the charming Lyubov, that he loves her.

This conclusion gave me a horrid moment of supposing that the conduct of Sadykov toward Lazlo had been actuated more by the desire for Lyubov than by respect for "Communist morality." I even played momentarily with the idea that the whole book was an elaborate and rather clumsy satire on this greatest and probably noblest of all man's efforts to mold his own fate, an idea somewhat buttressed by the fact that Beethoven and Turgenev are invariably used as synonyms for sentimental flabbiness, and Voltaire for an eighteenth century dancing master's ethos. But the approval of the millions of Russians who hail Pilnyak as a greater than Tolstoi effectually negates this idea, as does the dogged honesty of the book itself, which shows through all its elaborate machinery of wicked dealers in the antique and frustrated pre-revolution virgins and goatish engineers who would sell Christ for a handful of silver. But no, not Christ. Reading an old book about the saints, Poletika decided that it was "naive, decrepit and sad. Life will never go back to it. This river of the human spirit is dead. Christianity is done for," forgetting that already the new devotees file past the tomb of Lenin.

There are many ideas in this book, and there is almost no realistic depiction of character; there is much emotion, and little logic. But beside our pretty little confections on the one hand, and our childish playing with horror on the other, it is very much alive.

ALICE BEAL PARSONS

The Lowbrow's Encyclopedia

Man's Own Show: Civilization. By George Dorsey. Harper and Brothers. \$5.

HAD the publishers not assured us that this book bears the final revisions of the late George Dorsey, there might have been some excuse for its sheer badness. Then its disorganization, its incoherence, its complete failure to live up to its pretensions to being a survey of civilization, might have been explained as the faults of a half-finished manuscript which is no more than a set of notes. But one remembers the author's "Why We Behave Like Human Beings," which was a similar potpourri, with the same air of "I'm a lowbrow just like you." And one cannot blame the publishers (except for publishing it, which would be naive) for the bad humor and worse taste, the invincible ignorance displayed on every page of the present work. Certainly, the basis of "Man's Own Show," its grotesque burlesque of the historical method, is George Dorsey's.

Dorsey's idea of explaining anything about civilization is to carry it back to the monkeys. If he can find the rudiments of social organization among the primates, that somehow "explains" social organization. Or, another variation, he considers marriage and the family explained by pointing to its biological basis. The method results in such absurdities as this:

"Marriage—by capture, purchase, or decree, or whether monogamous, polyandrous, or polygamous—is marriage; and may or may not be founded on love. Man by nature is a marrying animal and all marriages presuppose an urge called love—desire to possess a mate."

An explanation of marriage by the fact that man is a marrying animal, is like the famous definition of opium as a drug which produces sleep because of its dormitive virtues.

One cannot explain social organization, mating, art, or similar universal categories. Such explanations always lead to such idiocies as the above, or this one about art:

Art is not so simple, for it is human life at its supremest moment of elation, at its acme of perfection. Man can live that kind of life because, I repeat, it is in his nature; he brought the aesthetic germ up with him in his ascent from the apes.

What it is the province of the student of civilization to explain is, for instance, not mating—he can take that for granted—but the historical forms it has taken: why capture at one time, purchase at another, decree at still another time, etc. That is the correct question for the anthropologist or sociologist to ask himself; for then he can correlate the economic modes of production with the social and cultural forms to describe the various social "wholes" in which the historical forms of mating appeared. Any attempt, such as Dorsey's, to explain an institution by its biological basis, simply reduces that institution to its basis, reduces sociology to biology: we are no longer talking about an institution but about a biological fact. So, for instance, Dorsey attempts to explain the family, and his argument that "the family" has always existed and always will is perfectly true, since what he means, at bottom, is that a man can have only one mother. In this sense, however, "the family" is an eternal institution of the animal and insect kingdoms. Dorsey, of course, identifies the biological "family" with the contemporary bourgeois family; and his assertion of its immutability will, no doubt, be a great comfort to his readers, coming as it does from a "scientist."

Such explanations of language, love, and religion, and "the first million years," Dorsey throws together as "Man's Natural Endowment." The second part of this 958-page book is given over to a poor rehash of some Egyptian, Greek, Roman and

Christian history, concluding with three chapters on the sciences. Anyone who wishes to see how invincible ignorance can really be, should read these chapters. The only people Dorsey really feels to be scientists are inventors like Edison and laboratory experimenters "doing" something. The use of abstractions, fictions, and conceptual models, systematizing, deduction, mathematics, the rational aspect of science, Dorsey never came near understanding. Mathematics just wasn't a science for him, for he measured it by the most grotesquely "practical" criteria. He has this to say of Einstein: "The Babylonian year of 365 days is not exact science, but it will be more useful in helping Mr. Einstein to handle his problems of taxation and death than all the mathematical formulas. . . ." For philosophy he has even less respect. It's just pre-science, like religion. Logic is nonsense, for there are no laws of thought, and in the air of metaphysics he "can scarcely breathe." Here is a typical remark: "Plato's Republic is an intellectual achievement of the first order, but no Democratic ass or Republican elephant could live in it, much less a Jefferson or a Lincoln." Only "Science" is worth anything. "It alone permits man to accept his world as he finds it and to use his brain and hand to get as much out of it as he can." This science, without reasoning and hypothesis, without mathematics and system, is just what the man on the street thinks science is.

The third and concluding part, "What Shall We Do To Be Saved," is on a par with the rest. The remedy for the ills of our civilization is "education in honest thinking, backed up by honest living"—all done by "Science." This is a vicious and harmful book, a veritable encyclopedia for the confirmation of vulgar prejudices.

FELIX MORROW

Stresemann

Stresemann. By Antonina Vallentin-Luchaire. Translated by Eric Sutton. Foreword by Dr. Albert Einstein. Richard B. Smith. \$4.

FRAU VALLENTIN-LUCHAIRE'S book is a remarkable piece of interpretative biography, notwithstanding that it verges at times dangerously near to hero worship. Its most striking formal feature is the sharp contrast which it draws between Stresemann's earlier and later life. Stresemann "never outgrew the emotional world of his youth" or the idealism which led him, born optimist that he was, to make "categorical moral demands on humanity." His attitude toward women was that of a prude, he excluded from his range of interest all women except his wife, and in domestic and social matters depended upon his wife for "the practical sense in which he was entirely lacking." His political rise owed a good deal to his oratory, which his colleagues in the Reichstag distrusted, but still more to his extraordinary ability to influence men, yet he did not quickly find his place, and a "deeply rooted mistrust . . . survived his convincing services to his country and did not disappear until his death."

It may be difficult for those who think of Stresemann mainly as an apostle of peace to realize that he began his political life "by enthusiastically supporting the fleet program," preached "the necessity of colonial development," and was "utterly convinced that the destiny of the German people and the stability of the German state could only be guaranteed by a demonstration of physical power." During the World War he swallowed all the official affirmations about German preparedness and efficiency, and was "utterly unprepared" for defeat and political revolution. Helfferich and Lord d'Abernon seem to have had much to do with changing his point of view, and his interview with Barthou in 1922 gave him for the first time a clear idea of rapprochement with France as the only

wise course for Germany. The devious and heartrending course that had to be followed before the externals of reconciliation were reached is traced by Frau Vallentin-Luchaire with understanding, sympathy, and stylistic brilliance, and with a wealth of incident that brings a long list of political notables into the picture.

Germany was bankrupt when Stresemann became Chancellor, and his first task was to win the press and public opinion to an abandonment of passive resistance in the Ruhr. Soon came the revolt at Munich, and in rapid course the ministries of Marx and Luther, the Dawes plan for reparations, the conclusion of the Locarno treaties, and the admission of Germany to the League of Nations, of all of which Frau Vallentin-Luchaire gives a moving recital. Particularly interesting are her accounts of the efforts of Haguenin to aid a Franco-German rapprochement, the abrupt refusal of Poincaré to receive Stinnes unless the latter were officially accredited by Berlin, the famous interview between Stresemann and Briand at Thoiry, Stresemann's journey to Paris to sign the Kellogg pact and the interview at which Poincaré learned something of the inwardness of the Locarno undertakings, and the long struggle of Stresemann with incurable disease. If the net impression of the book is not to enhance respect for Stresemann's intellectual powers, it will nevertheless deepen regard for his high moral ideals, his immense emotional force, and his complete devotion, once the war had separated him from his past, to the cause of European peace.

WILLIAM MACDONALD

The American Critic

Literary Criticism in America. By G. E. De Mille. The Dial Press. \$3.50.

MR. DE MILLE'S book is very competent as far as it goes, but as it stands now, it is a tantalizing piece of work that leaves the reader neither here nor there. For one thing the bulk of the book is given over to retracing familiar ground: it is taken up with Lowell, Poe, Emerson, Henry James, Howells, Huxley and Sherman. The new matter is more restricted: a discussion of the early critics of the *North American Review*, a few pages on E. P. Whipple, an essay on Stedman (very revealing) and isolated paragraphs on various minor writers, together with a brief and very selective bibliography of some of the critics not discussed. This gets us a bit beyond the volume by Norman Foerster, Litt. D. (University of the South), but it is far from covering the whole field.

One thing that perhaps stopped Mr. De Mille from writing a comprehensive study in a difficult field is the fact that he has little patience with "seriousness." Commenting on James's declaration that a novelist should be in some sense a historian, he writes, "Such earnestness is, of course, most praiseworthy, yet it is perhaps a truer sanity that sees in the literary artist more than a little of the circus clown." A man who actually holds such an opinion is simply out of the running for any really balanced treatment of literary problems, and Mr. De Mille's essays lead one to believe that in putting that down in cold type he was, strangely, posing. His work at its best is very "serious" and if the reviewer should call his book "clowning" he would quite properly get angry.

Without being captious, it is possible to point out some inadequacies. In trying to steer a course between Norman Foerster's over-systematization of Lowell and the judgment that Lowell was entirely fragmentary and hence not a worthwhile critic, he gets pretty badly boggled and comes up unexpectedly with the conventional judgment that Lowell was the greatest American critic. In trying to show Howells's inadequacies as a critic (which he does very well) he fails to develop

what is most important about Howells in this department: his influence on the development of American taste. In writing of Henry James, he falls into the usual error of insisting that James could not shake off Boston ideas in some particulars. James actually lived in New England less than ten years, broken into several periods. His ideas on morals were influenced, not primarily by New England associations, but by his father, which is indeed another matter. But in general Mr. De Mille is both accurate and full of sound judgment—in spite of his pose! He has fulfilled his intention of writing a "preliminary survey" very competently. But the field is still open for someone serious enough to get through a "comprehensive" study.

C. HARTLEY GRATTAN

A Neglected Poet

The Sonnets of Frederick Goddard Tuckerman. Edited with an Introductory Essay by Witter Bynner. Alfred A. Knopf. \$2.50.

WITTER BYNNER does not claim too much when he says in his very good introduction: "Tuckerman, in his sonnets, seems to me not only the peer of his great contemporaries, but the equal of his most important successors." And this volume, in which are presented three groups of Tuckerman's sonnets written between 1854 and 1872, is a real contribution to American letters. Why Frederick Goddard Tuckerman was forgotten when his contemporaries Bryant, Whittier, Longfellow, Emerson, Poe were presented in every history of American literature and every classroom anthology is not difficult to understand. For many years two other American poets, Whitman and Emily Dickinson, were also lost to us. Like these two, Tuckerman is not in the traditional literary manner of his day. He did not, like Whittier, Longfellow, and the others—with the exception of Poe and, to a lesser extent, Emerson—take on the inherited craftsmanship of English letters or the inherited subject matter of English poetry; he spoke for himself and almost entirely to himself. His "Poems" were printed during his lifetime and were known to Tennyson, whom he visited; they were commended by Longfellow and Emerson, who chose for favorites, however, the more usual lyrics. Tuckerman's lyrics, with their flowery phraseology, their elaborate rhythms, are completely in accord with the tradition of his own day; his sonnets are not. Today his sonnets are very much alive; his lyrics will be allowed to die.

Mr. Bynner shows excellent critical judgment in his selection of the seventy-four sonnets presented in this volume; his is the credit for the rediscovery of this American poet. Mr. Louis How knew of the "Poems," but he did not publish them; Witter Bynner, after twenty years of critical consideration, has given Tuckerman to modern readers, who will understand and appreciate him.

Tuckerman's sonnets have to do with a deep personal grief,—the loss of his wife—with the first violent shock to the very foundations of his sensitive mind and with the slow rebuilding of his life through the twenty years that followed; they are introspective, analytical, concrete, and emotional. Tuckerman was a serious-minded man concerned always with his own relationship to the life he must live through, and this concern is the philosophical undercurrent of his thought. But better than this, he was a poet and had a poet's eye and sensibility. He saw the natural scene as it actually existed, not, as did some of his contemporaries, in romantic guise; he felt emotion in terms of homely experience, and here he is allied with Emily Dickinson; he groped toward truth which would be no false message to a people but a personal truth valuable to his own soul. He

withdrew more and more into himself, and his sonnets grew more and more introspective and thoughtful—their form more original and abrupt. And always they had that swift certainty of image, that clarification of intense thought which is poetry. They are not, of course, all equally great sonnets, but in almost every one there is something which is convincing, which indicates that Tuckerman was indeed a poet of attainment, and that we should do well to list him with his contemporaries, and perhaps above them, although he wrote so little.

What other American of this day, save those two left for the twentieth century to discover, wrote lines like these:

The breeze is sharp, the sky is hard and blue,
Blue with white tails of cloud. On such a day,
Upon a neck of sand o'erblown with spray,
We stood in silence the great sea to view
And marked the bathers at their shuddering play
Run in and out with the succeeding wave,
While from our footsteps broke the trembling turf.
Again I hear the drenching of the wave;
The rocks rise dim, with wall and weedy cave;
Her voice is in mine ears, her answer yet:
Again I see, above the froth and fret,
The blue loft standing like eternity—
And white feet flying from the surging surf
And simmering suds of the sea!

or

And yet tonight, when summer-daylight dies,
I crossed the fields against the summer gust
And with me, rising from my feet like dust,
A crowd of flea-like grasshoppers, like flies
Presaging dry and dry continuance; yet
Where they prefigure change, all signals must
Fail in the dry when they forebode the wet . . .
I know not. All tonight seemed mystery:
From the full fields that pressed so heavily,
The burden of the blade, the waste of drouth,
The twinkling of the smallest life that flits—
To where, and all unconsciously, he sits:
My little boy, symbolizing eternity,
Like the god Brahma, with his toe in his mouth.

EDA LOU WALTON

Books in Brief

The Misted Mirror. By Henry Daniel-Rops. Translated from the French with a Preface by R. H. Mottram. Alfred A. Knopf. \$3.

Two Men in Me. By Henry Daniel-Rops. Translated from the French by Gil Meynier. Thomas S. Rockwell Company. \$2.

The author of these two works of imaginative fiction, both treating of states of spiritual conflict within the ego, is a young man who has become identified with purely post-war literary movements in France. Before the publication of his first novel, "The Misted Mirror," (1928), which was runner-up for the Goncourt prize, he had achieved a considerable reputation as critic among the younger generation. "Two Men in Me" (1930), a volume with an eminently apt title which won the Gringoire prize, is a collection of four stories of that anomalous length which has in the past proved so adaptable to the needs of M. Daniel-Rops's spiritual forebears in French literature. Both the novel and the long short stories exhibit the same qualities of thought and form. In general the impression conveyed is of an author of genuine and original literary talent who has, as yet, in fiction, not quite arrived. But Book I of the novel is a single piece that rises to genius. In this study

of an adolescent whose special problem as a lonely boy is complicated by the war for which he will soon be old enough to enlist, we have a single story worthy to stand beside the best of its kind. The rest of the novel—as the protagonist approaches the age of the author—grows increasingly less interesting and powerful. M. Daniel-Rops remains, however, at all times the literary artist. One recommends, without any reservation, both these fascinating books to the discriminating reader.

The Dream of Fair Women. By Henry Williamson. E. P. Dutton and Company. \$2.50.

This is Henry Williamson's first novel, now entirely rewritten. It takes its place as the penultimate volume of his tetralogy "The Flax of Dream." Those who have read "The Beautiful Years," "Dandelion Days," and "The Pathway" will find here the same individual, the same poetic spirit, the same lover of nature in all her varied forms, the same twentieth century romanticist. The present volume like the others, however, is uneven in quality. When Williamson writes of Willie Maddison in his shack, living the life of a hermit, surrounded by birds and beasts he has picked up, absorbed in his creative work and his dreams; and, again, when he writes of the coming of Eve and the love that follows, we know we are in the presence of beauty expressed in superb prose. But the last two parts of the novel which are concerned with Willie's drawn out affair with Eve at a seaside resort, while moving and engrossing, lack real distinction. Perhaps one expects, by comparison with others, too much from one who has written some of the rarest prose passages of our day.

The Recovery of Myself. By Marian King. Yale University Press. \$2.

"A Patient's Experience in a Hospital for Mental Illness" is the sub-title to this autobiographic fragment which carries an introduction by Dr. Adolf Meyer of The Johns Hopkins. The story is not in the least sensational. It is obviously sincere. The chief value of the volume lies in the insight—from the patient's viewpoint—it gives us into the practical application and the workings of modern psychotherapy in an advanced institution. The sceptic toward the new psychology, where generally applied in the realm of therapeutics, will not be disturbed by the success of the mild case which this book presents. He will be inclined to believe that it was chiefly pathological—the case of a healthy, athletic girl thrown out of her stride by a growing indulgence in the veronal habit. But the enthusiast will catch a glimpse of the workings of all the favored methods—the various "tests," the confessional, the whole symbolic formula—naively described by an intelligent young woman who entered the sanatorium a rebel and emerged a whole-hearted convert.

Biology in Human Affairs. Edited by Edward M. East. Whittlesey House. \$3.50.

Wherever the authors of this book restrict themselves to informative description of biological facts they are interesting; at other times they are at best dull, at worst inane. The editor in the introductory chapter is pointlessly aggressive. He even finds several opportunities to make irrelevant comments on the "foolish ideas" of Soviet Russia. The reader may be prepared for 400 pages of tilting at windmills, but he is agreeably surprised to find that the chapters on psychology which follow are modest and direct. These are by far the best in the book, the chapter on Educational Psychology by Lewis M. Terman being especially excellent. One must sympathize with the difficulties of writing a book such as this. A writer who is asked to cover medicine, heredity, physiology, or zoology in ten or twenty pages must become either worthlessly superficial or hopelessly involved. The authors of these chapters have not

succeeded in avoiding the two alternatives. More specific topics such as public health, food supply, and nutrition are handled more satisfactorily. It is surprising to read in a book the keynote of which is "ascertained truth" that "the United States has been, and is, an extraordinarily prosperous nation." This accomplishment is credited to a "small group of trained men of high intelligence, the men who deal masterfully with the problems of science, art, politics, and business." We are apparently to deduce that the less prosperous nations have not been so fortunate as to have among their citizens such samples of intelligent stock as bless our own country. It is hard also to understand why Dr. Fishbein, who is editor of the *Journal of the American Medical Association*, should make such an unsupported statement as that "by the application of our modern knowledge of nutrition it may be possible to make men who are . . . better thinkers than man of today." Nor, so far as the reviewer knows is there any hormone obtained from testes that will "control diseases formerly considered fatal." The bibliography is inadequate.

A Farewell to India. By Edward Thompson. E. P. Dutton and Company. \$2.50.

This is a novel of one man's spiritual struggles as they manifest themselves when he pits himself in his educational work against the many and complicated problems of contemporary India. Robert Alden is principal of a missionary college in provincial India. He has given the best years of his life to working for and with the natives. The breakdown in his health which comes at the end of the novel and necessitates his return to England coincides with his final conviction that India is on the verge of great change, that his own work is over and has probably been futile, that his generation and school of thought are out of it or soon will be, and that the seething conditions in India have got out of hand to an extent where he and those moderates who think with him, both Englishmen and Indians, are of no further use. These and other reflections he works out in long absorbing conversations with his friends, in an attempt to arrive at conclusions which more often than not evade him. The author knows India; whether he understands the contemporary trend himself, to judge from his protagonist, seems doubtful. This is a thoughtful book, and a finely written one.

Unemployment Insurance in Great Britain. By Mary Barnett Gilson. New York: Industrial Relations Counselors. \$5.

The second volume in Industrial Relations Counselors' important series of studies of unemployment insurance is Miss Gilson's encyclopedic work on the British system. Its four hundred pages of text and one hundred pages of appendices embody an enormous mass of information on the history and actual operation of this, the oldest and most comprehensive of modern schemes of unemployment insurance. Miss Gilson marshals her facts with great skill and fairness, and her whole study is marked by the fine scientific temper so necessary in the judgment of a complicated system whose operation is involved in clouds of contemporary controversy. If her conclusions are, on the whole, favorable to the insurance scheme, that result is due to no lack of consideration of all the criticisms, both justifiable and unjustifiable, that are urged against it, but to the weight of the vast mass of facts that she presents and to her constant awareness of the economic as well as the social conditions under which the insurance scheme operates. Her work is indispensable to students of unemployment insurance, and her summary of conditions arising out of British experience deserves the thoughtful attention of every person in any way responsible for the shaping of the present policy in the United States.

Films

Emasculated Dreiser

IF there is anything tragic about the film version of "An American Tragedy" (Criterion), it is the pathetic spectacle of its producers trying to crash the gate of the artistic heaven with the yellow ticket of their profligate trade. I am no Saint Peter, but any person of moderate intelligence could have told these gentlemen that they were wasting their time in imagining that they could change the color of their ticket merely by protesting their fanatical concern for artistic virtue. Alas! this is about all they have done. They had not even the foresight to disguise their cheap finery and loud manners under some borrowed cloak of academic respectability. This alone, of course, would not have placed their creative effort on the level of achievement represented by Theodore Dreiser's penetrating novel, but it would at least have proved their earnest desire to rise to the auspicious occasion.

And the occasion was an auspicious one. Whatever else can be said of Dreiser's opus, it does throb with the pulse of full blooded reality, perhaps even a reality too raw for literary appraisal. An intelligent producer with enough imagination to translate life into cinematic terms would have dug into this mine of human material to unearth and mold into shape the elements that were most vital and meaningful. Not so the producers of "An American Tragedy." All they could see in the story was some paste-board romancing and the hackneyed dramatics of the court room. It is not even that they failed to note the social implications of the tragic murder, as the author has accused them of doing, that makes the film such a humdrum affair. More important is their utter failure to infuse some genuine life into the characters which are paraded before us in all the familiar trappings of Hollywood puppets. Even the much touted court room scene contributes little to relieve the flatness and pointlessness of the film. It leads nowhere, leaves the principal character as nebulous as in the preceding scenes, and only tries to make up for the absence of dramatic climax by a much too liberal display of court room histrionics.

A superior picture, if only by virtue of its two magnificent scenes of evangelistic mummery in a tabernacle, is "The Miracle Woman" (Mayfair). Here, at least, is some excellent and genuine material of life, striking in its unfamiliarity and effectively presented. The director of the film, Frank Capra, can be congratulated on the skilful handling of these scenes; and there is also merit in the story in so far as it attempts to expose the fakery that goes under the name of evangelism. Its romantic motif, however, leaves much to be desired. With all its adumbrations of a blind boy, formerly an aviator, falling in love with the evangelist, and of his rather theatrical penchant for revealing his mind through a ventriloquist dummy, it never succeeds in ringing true and convincing. Nor, it must be added, is Barbara Stanwyck quite successful in conveying the magnetic glamor of personality that contributes so much to the evangelist's power for swaying the multitude. A Nora Bayes would have given an impressive portrait of the character. But then she was hardly the person to fit into the scenes of soft-pedalled romanticism.

To discuss "Bought" (Hollywood) with Constance Bennett in the leading role would be to repeat my previous strictures. The only palliating thing to be said for the picture is that Miss Bennett, though as kittenish as ever, is a little more natural. Nothing need be said about the story.

Spain Lets the Military Down

By I. M. LEVY

Madrid, August 6

WHEN, on May 5, the mild-mannered and scholarly Minister of War, Don Manuel Azaña, informed a reporter of the Madrid *'Sol'* that he hoped to be able to effect a saving of some 100,000,000 pesetas to the nation on its annual military expenditures, he was apparently far underestimating his own abilities. Within twenty days of this statement, he had promulgated a reform which promises, not only to divert a minimum of 200,000,000 pesetas a year into more constructive channels, but likewise, to minimize greatly the evils of compulsory service, and produce a vastly more mobile and efficient armed force.

Ever since the loss of her overseas dominions forced her to withdraw large numbers of officers and men from service abroad, Spain has been blessed with an army far out of proportion to her needs, and a commanding force far out of proportion to the needs of her army. The result has been an incredible corruption of the high command, an assumption of arrogance, and even of lawlessness, on the part of the officer class which has incessantly menaced the stability of civil institutions, and the complete devitalization of the rank and file. With the ridiculously small proportion of ten soldiers to every commissioned officer, it was found necessary to create innumerable sinecures to care for the surplus of the latter. With more individuals seeking promotion than there were promotions to be made, competition became intense, leading to the wholesale purchase of rank, either in terms of cash, or in terms of "service" to superiors. With little to do, and ample time in which to do it, the energies of the officials were diverted into the sphere of politics, and into meddling with the affairs of the nation in general. A direct product of this extracurricular activity was the elaborate espionage system recently unearthed by the present incumbent, in which every officer of the army was classified according to his political leanings. The records of these activities have ostensibly been destroyed. With almost 490 millions of pesetas, out of a total appropriation for 1931 of 651 millions, being expended on salaries for officers (pay for the ranks is negligible, amounting to five cents per day per capita, at par value), a mere 161 millions was left for equipment, resulting in cavalry troops sans horses, artillery minus guns, and infantry without the means of loading their rifles. Azaña declares that, at the present moment, there is insufficient material in the entire army to outfit a single division properly, while huge sums are being spent yearly in the maintenance of garrisons which outlived their usefulness with the expulsion of the Moors. In accordance with universal practice, the burden of supporting this massive and utterly inefficient organization was laid directly upon an already sufficiently hard-pressed people, and the system was rendered all the more odious by the bitter realization of the little which it had produced in the past.

Azaña, to curb the tendency of the military to meddle in the affairs of civil government, and to trim down the

number of officials to the point where the tail may be carried by the dog, has offered passage to the reserve, on full pay, to the 258 officials of the high command, and full retirement, on a similar basis, to the 21,996 minor commissioned officers not otherwise eligible for early retirement. The decree authorizing this step, dated April 25, while worded in a somewhat diplomatic manner, carries with it a hint of less agreeable measures to be taken should it fail in its purpose. Diplomacy in its wording was desirable, for military coups have been known to have been attempted before in Spain, under the direction of some disgruntled warrior. But, for the first time, the civil government has been able to do more than merely "suggest" to the army, for so long a law unto itself. The ranks have become conscious of their nationalism. They no longer constitute "the army of the Crown," but "the army of the nation," and Madrid, sensing a greater confidence in them, has, in consequence, experienced a feeling of greater confidence in itself. These vaguely threatened measures, however, will not have to be taken. The latest official figures place the number of generals who have voluntarily placed themselves on the inactive list as 220, and the number of lesser commissioned officers who have followed suit as 15,967.

In addition, the examinations for entrance into the Academia General Militar, the Spanish equivalent of West Point, have been suspended, thus curtailing the further influx of young officers into the army. Obviously, since every individual who has taken advantage of the retirement offered by the reform will draw full pay for life, the economic saving will not be felt for many years to come. But the effect upon the nation in general has been astounding. A feeling of confidence has been engendered in the government which might otherwise not have been acquired for years. The Spaniard, through long and intimate contact with his legislative bodies, has developed a cynicism and suspicion with regard to them that even a government of his own creation could not altogether counteract. But the attempt of the provisional government to "put the army in its place," has won his whole-hearted admiration and support.

Nevertheless, the reform of May 25, affecting the physical composition of the main body of the army, is of even greater importance to the nation, for in this lies the much desired saving of man power and money to the nation. In place of the former sixteen unwieldy and loosely organized divisions, some of them of less than skeleton strength, although listed as of full fighting efficiency, there will be organized eight, far more compact, and far more efficient. It is in the elimination of fifty-three regiments, with the outposts which they garrisoned, and the repeated use of the same materials by succeeding groups of recruits, that the 200,000,000 pesetas is to be saved. It is in the shortening of the term of required service from two years to one, with a reduction of the numbers involved, that the saving of man power is to be achieved. The 223,000 non-commissioned officers and men who formed the army of the Crown, have

now been reduced to 103,349 in the service of the Republic.

The working classes stand firmly behind the proposed changes, for the army has always been disliked by them. It was the symbol of tyranny and oppression to them, the defense of an overbearing and unpopular government. It was something which they had to maintain, albeit under protest. And it was an unpleasant experience through which every able-bodied male member of them had to pass. The fracas of 1921 in the Moroccos crystallized what had formerly been merely dislike into an intense and burning hatred, for the 20,000 men who died in Africa, as a result of Abd-el-Krim's attack, were recruits from the lower classes almost in entirety. But there still exist in Spain a large number who dream of a time when Spain will take her rightful place among the great powers of the world, and who view any abbreviation of the military and naval forces with suspicion and alarm. But these, fortunately, constitute too small a minority to exert any appreciable influence in opposition to the changes. The vast majority of the Spanish, kindly and peace-loving, would exchange all the expensive and, to them, useless outlying territories for a few more school buildings in Aragon, and the proposal to spend perhaps the entire 200,000,000 in eliminating the widespread illiteracy which has held Spain back for centuries, has been met with keen enthusiasm. But even among those who stand behind the reforms with heart and hand, there is a certain scepticism, a certain "wait and see" attitude. Prolonged familiarity with the promises of his governments in the past has led the Spaniard to restrain his exuberance for anything which is no more substantial than the paper upon which it appears. Nevertheless, Azaña is perhaps the one man in the provisional government who does what he promises to do, and the rapidity with which results have been produced seems to bear out this assertion.

Einstein's Peace Appeal

The following letter from Professor Albert Einstein was addressed to the Conference of the War Resisters' International which met at Lyons from August 1 to August 4:

I address myself to you, the delegates of the War Resisters' International, meeting in conference at Lyons, because you represent the movement most certain to end war. If you act wisely and courageously, you can become the most effective body of men and women in the greatest of all human endeavors. Those you represent in fifty-six countries have a potential power far mightier than the sword.

All the nations of the world are talking about disarmament. You must lead them to do more than talk. The people must take this matter out of the hands of statesmen and diplomats. They must grip it in their own hands. Those who think that the danger of war is past are living in a fool's paradise. We have to face today a militarism far more powerful and destructive than the militarism which brought the disaster of the Great War.

This is the achievement of governments. But among the peoples the idea of war resistance spreads. You must challengingly and fearlessly extend this idea. You must lead the people to take disarmament into their own hands and to declare that they will take no part or lot in war or in the preparation of war. You must call upon the workers of all countries unitedly to refuse to become the tool of death-dealing interests. There

are young men in twelve countries who are resisting conscription by refusal to do military service. They are the pioneers of a warless world. Every sincere friend of peace must support them and help to arouse the moral conviction of the world against conscription.

I appeal especially to the intellectuals of the world. I appeal to my fellow-scientists to refuse to cooperate in research for war purposes. I appeal to the preachers to seek truth and renounce national prejudices. I appeal to the men of letters to declare themselves unequivocally. I ask every newspaper which prides itself on supporting peace to encourage the peoples to refuse war service. I ask editors to challenge men of eminence and of influence by asking them bluntly: "Where do you stand? Must you wait for everyone else to disarm before you put down your weapons and hold out the hand of friendship?"

This is no time for temporizing. You are either for war or against war. If you are for war, you must encourage science, finance, industry, religion, and labor to exert their power to make your national armaments as efficient and deadly as they can be made. If you are against war, you must encourage them to resist it to the uttermost. I ask everyone who reads these words to make this great and definite decision.

Let this generation take the greatest step forward ever made in the life of man. Let it contribute to those who follow, the inestimable right of a world in which the barbarity of war has been for ever renounced. We can do it if we will. It requires only that all who hate war shall have the courage to say that they will not have war.

I appeal to all men and women, whether they be eminent or humble, to declare before the World Disarmament Conference meets at Geneva in February, that they will refuse to give any further assistance to war or the preparation of war. I ask them to tell their governments this in writing, and to register their decision by informing me that they have done so.

I shall expect to have thousands of responses to this appeal. They should be addressed to me at the headquarters of the War Resisters' International, 11 Abbey Road, Enfield, Middlesex, England. To enable this great effort to be carried through effectively, I have authorized the establishment of the "Einstein War Resisters' International Fund." Contributions to this fund should be sent to the treasurer of the W. R. I., 11 Abbey Road, Enfield, Middlesex, England.

BODY and SOUL - - - and your VACATION!

From Confucius to Plato to — Broadway philosophy to a LOG TAVERN vacation is seemingly a far and disordered cry. But "body and soul" unities persist.

LOG TAVERN respects your BODY with acres of woodland poetry, a lake all its own set 1500 feet high in the Pocono hills, ten perfect tennis courts, handball, baseball, riding, all water sports, golf, basketball, everything but Greek foot-races for form held on the sands . . . and food Mr. Epicurus would most certainly endorse if he were living in Greenwich Village. . . .

LOG TAVERN respects your SOUL as well with all the above (if you please) with its dramatic and musical entertainment of professional caliber, its concert programs, its poetry reading, its intelligent fellowship of young men and women, its dancing, its play of sun and sky and dream. . . .

July and August Rate \$37.50

THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London W. C. 1, England.

THE BRITISH FINANCIAL situation is still not as clear in all its aspects as it might be, but it may at least be said with some confidence that the recent "crisis" was a great deal more of a London banking crisis and a great deal less of a British budget crisis than it is commonly supposed to have been, or than most of the statements either from London bankers or from British statesmen would lead one to imagine. Exchange does not collapse nor are foreign short-term balances suddenly withdrawn within weeks or days because of a budget situation that has been visible to the world in its main outlines for many months. Further, if it had really been the British budget deficit that was causing the gravest concern, the fact would have been immediately reflected in the price of British Government bonds in this market. The 5½ per cent. issue of 1937 this year reached a record high quotation of 108¾; the lowest price to which the bonds fell in the recent break was 104⅝, and at the present quotation they are selling on a 4½ per cent. basis, compared, for example, with approximately a 10 per cent. basis for German or Australian government bonds. The precipitating cause of sterling's weakness seems rather to have been the German banking crisis. London bankers had apparently been borrowing heavily from New York and Paris, taking advantage of low rates, to relend at higher rates to Berlin; naturally when their loans to Berlin were

frozen, while their borrowings from New York and Paris fell due, their position was unenviable; gold and balances inevitably flowed out.

THIS IS NOT TO SAY, of course, that the British budget situation is not a serious one, or that measures to balance the budget were unnecessary to reassure the bankers who were being asked to extend a further stabilizing credit of \$400,000,000 when \$250,000,000 had been loaned only a few weeks before. It is not a situation to be viewed with complacency, however, when international bankers are able, if they choose, to wield so much power and influence over the policies of the principal governments of Europe as they are today. *The Nation* does not believe, moreover, that the measures so far proposed in Great Britain either to reduce expenditures or to increase revenues are entirely commendable. We discuss elsewhere in this issue the proposal to reduce the "dole." The apparent conversion of the trades union leaders to a 10 per cent. "revenue" tariff is equally disturbing. Such a tariff, it is obvious, would simply add one more to the barriers that have been damming the flow of world trade.

"ALL HANDS TO THE PUMPS"—that is a characterization of the British situation attributed to one of the leading Conservative members of the Cabinet. Well, why is it that it is necessary to sound the call "all hands to the pumps" to keep the British ship of state from foundering economically? It is because some three or four British statesmen on August 1, 1914, put their great nation into a war in which it had no direct interest whatever, because, as it was explained suddenly, there were moral and contractual obligations which compelled England in honor to go to the rescue of France and Belgium. The man who stated that this obligation rested upon his countrymen was the same man who in answer to a question in the House of Commons sometime previously, had denied the existence of any such agreement. We hope that Sir Edward Grey in his retirement is not overlooking this sequence of events; the crisis which has brought about the downfall of the Labor Ministry is the direct outgrowth of the plunge into war in August, 1914. The victors have been claiming ever since 1919 that they won that war. *The Nation* has always denied it because of our belief that the war is not yet ended in its economic consequences and that nobody won it or could win it. With all respect to the desires of the new National Cabinet to balance the budget, that alone will unfortunately not save England any more than it will Germany. No wonder that Bernard Shaw says that until the problem of unemployment is solved and the bankers realize that the world is not going on as it did in the nineteenth century, there is really no use of talking seriously of safeguarding England.

WHAT A RESTLESS, suspicious world we are living in at present! A military mutiny precipitates an abortive revolt in Portugal; the troops of President Carmona

put it down with bloodshed, eighty rebels being killed. The radical members of the Bulgarian parliament shout their defiance of King Boris as he arises to address them. The Japanese arrest two American fliers suspecting that they are in fact American spies. Two dozen Japanese and Koreans are wounded in anti-Japanese riots in Tsingtao. One deputy is killed, two others hurt, in a shooting affray on the floor of the Mexican congress. Five hundred unemployed storm the provincial state house in Fray Bentos, Uruguay, demanding bread. Peru, which has had one insurrection after the other since the dictator Leguia was deposed, remains in a constant state of ferment; dozens of persons are hurt in a battle with the police; another regiment mutinies at Ayacucho, the rebellion being ruthlessly suppressed by loyal troops. Chile inducts a new president, the fourth it has had since Ibanez fell in the revolution of a month ago. A third military mutiny is reported from Ecuador; President Ayora hurriedly resigns; the people rush through the streets of Guayaquil crying "Down with the Government," not knowing who the government is. These fugitive items, culled from news dispatches of the last few days, bring rather sharply to mind a picture of the restless feeling that seems to be sweeping the world as we near the end of the second year of the economic depression. The picture is neither encouraging nor comforting.

WE ARE GLAD that Gandhi has reconsidered his decision not to attend the Round Table Conference, and is now on his way to London. The London negotiations, which will be difficult at best, would have been futile and pointless without Gandhi on hand to represent and advance the interests of the great majority of Indians. How small was the controversy with the Government of India that had earlier persuaded him to remain away can be seen from the quickness with which it was adjusted once the Congress leaders and government officials came together to discuss it. It is reassuring, too, to know that despite the Cabinet crisis, Ramsay MacDonald is to preside over the conference, since it was his sincerity, patience, and tact that helped so much to bring the first meeting to a successful conclusion. Unhappily, under the terms upon which the National Cabinet was organized, the results of the second conference cannot be submitted to the present parliament for approval. They will have to await the election of a new House of Commons, which may be predominantly, if not overwhelmingly, Conservative. Nevertheless, with Conservatives and Liberals as well as Laborites participating in the Round Table Conference, it does not seem likely that a Conservative parliament will overturn the work of that conference.

GOVERNOR ROOSEVELT deserves high praise for his courage in demanding of the New York State Legislature that it immediately raise the State Income Tax by 50 per cent to provide money for the State to support the unemployed in the coming winter. Himself a rich man, he has taken a course which will cause much growling and grumbling among the well-to-do, most of whom are themselves hard hit by loss of income. He has also set an example to President Hoover by utilizing a special session of the Legislature, called for another purpose, to provide this relief in the month of September, whereas Mr. Hoover,

with incredible obstinacy and short-sightedness, refuses to call Congress together. As for the Governor's message, it is a correct statement of what the duty of the state is toward the individual citizen, for he declares that "modern society, acting through its government, owes the definite obligation to prevent the starvation or the dire want of any of its fellow men and women who try to maintain themselves but cannot." In addition he warns the Legislature that very large additional sums must be looked for during the coming winter if the State is to live up to its obligation, and he has made the excellent suggestion that the sum appropriated by the Legislature be handled by a special commission of three, one to be a woman, to be appointed by him for this emergency. He can be relied upon to make it non-political.

WHEN WE HAVE SAID THIS in praise of Governor Roosevelt's action we have, however, recorded everything that can be said in its favor. For the raising of \$20,000,000 by this increased taxation will be utterly inadequate; this money cannot be described as "very large additional sums". One has only to recall that the State voted \$10,000,000 for public works last winter to make it clear that the \$20,000,000 will last but a little time. More than that, the Governor's assurance that no needy person shall receive money because that would be a dole, is nothing less than childish. He declares that the State through local agencies may give "necessary food, clothing, fuel, and shelter", but "under no circumstances shall any actual money be paid in the form of a dole." What an incredible absurdity! Does the fact that the State takes cash and buys coal and clothing, and pays rent, make these gifts anything less than a dole? What is there about cold cash that makes a sane man like Governor Roosevelt think that giving dollar bills to a starving man or woman is worse for his character than presenting him with a suit of clothes which he might buy for himself were the State to give him the cash? Of all silly hair-splitting, this is the worst that we have seen. But beyond and above this remains the salient fact that \$20,000,000 disbursed through whatever channel may be selected will not keep a fraction of those alive who are in need of it and will be during the coming winter. We are entirely of the opinion of Norman Thomas that the relief asked of the Legislature is "tragically inadequate."

FURTHER AMAZING DETAILS of the independent campaign to defeat Alfred E. Smith in Virginia in 1928 have been brought to light through the persistent efforts of Senator Nye and his investigating committee. The campaign was directed by Bishop James Cannon, Jr., who from the start has defied the committee to inquire into his activities. None the less, the committee has learned that Bishop Cannon maintained eight separate bank accounts during the campaign, that funds were constantly shifted from one account to another in this period, and that several heretofore unreported contributions found their way into the various Cannon funds. Furthermore, Chairman Nye has charged: "When all the information is put together it will reveal not only the shifting, but clearly show actual diversion of campaign money to the private accounts of Bishop Cannon." F. P. Ferguson, president of the Hudson County National Bank, Jersey City, presented the committee with tangible evidence in the form of two cashier's checks

that former Senator Frelinghuysen of New Jersey had contributed \$10,000 to the Cannon funds. Other bankers testified that a \$5,000 contribution had come from Claudius Huston, who later became chairman of the Republican National Committee. Neither of these donations had been reported as required by law. E. C. Jameson, another contributor, presented a telegram showing that the Republican National Committee had approved the independent campaign against Smith conducted by the Bishop and Bascom Slomp. Jameson asserted, however, that "the committee wouldn't do the financing; I suppose it wasn't considered good ethics." But ethics does not seem to have troubled other persons connected with the anti-Smith campaign.

JULY BROUGHT A FURTHER sharp decrease in railway revenues. Indeed, so low have the earnings dropped that some of the smaller roads, among them the Atlantic Coast Line, were run at a loss during that month. Net operating incomes of fifty-four railroads totaled only \$43,715,000 for the month compared with \$64,722,000 in July, 1930, and \$94,282,000 in July, 1929. Thus their total revenues were 32.4 per cent less than a year ago, and 53.6 per cent lower than the same month of 1929. Many of the larger lines reported even greater proportional decreases. The Pennsylvania, for example, had a net income in July of \$4,113,751, which was 55 per cent less than the \$9,046,611 reported for July a year ago, and this comparatively meager return was apparently made possible only by slashing maintenance and other expenses to the amount of \$5,634,000. Quite naturally the continued poor showing of the railroads has reacted unfavorably upon the investment market. The rail stocks do not move up, or at best only half-heartedly, when the market rallies, and they are among the first to fall when a bear movement develops. A year and a half ago the average price of twenty-five selected railroad stocks was \$136; today the average price of the same stocks is approximately \$56.

THE CONVICTION of Col. Luke Lea, who has been sentenced to serve from six to ten years in a North Carolina State prison, is another tragic outcome of the get-rich-quick episode in our economic history which was terminated so abruptly in 1929. Col. Lea served one term in the United States Senate where his arrival was heralded as indicating the prospect of a great improvement in the personnel of the Senate from the South. Exceptionally fine-looking and able, apparently of some liberal ideals, it seemed as if he had a great career before him. He could not, however, maintain himself. Nor did his excellent record in the army help him as he stood at the bar. The jury found Col. Lea guilty of borrowing \$825,000 from the Central Bank and Trust Company on improper and worthless collateral; of keeping \$214,000 worth of the bank's bonds without making a settlement; of depriving the bank of a profit of \$45,000 on a City of Asheville note issue, besides fraudulently obtaining \$300,000 worth of the bank's certificates of deposit. We are told that if the whole story of the robbing of this and other banks in Asheville with the connivance of the officials were narrated it would present one of the most startling pictures in the history of our rugged individualism, and prove very oddly the desirability of private initiative in business. Finally, it is interesting to note that as the owner of two

prominent newspapers in Tennessee Col. Lea has been busy in instructing many of his fellow-citizens as to how they should vote upon economic and political problems of the day.

WHITE HOUSE press conferences have become a bitter joke in Washington. The President who abolished the "Official Spokesman," and who promised to be frank and straightforward in his relations with the newspapermen, that is, with the public, has coldly turned his back upon these correspondents. The semi-weekly press conferences in the Executive offices, which had become a permanent and to some extent a useful institution, are now omitted with increasing frequency. The correspondents went three weeks in August without being admitted into Mr. Hoover's presence. Even when the conferences are held Mr. Hoover does not answer questions addressed to him, but offers the correspondents instead previously prepared statements which all too often have no bearing on the news of the day. About the only press conference in Washington that has survived this sort of negative censorship is the daily meeting of the reporters with the Secretary of State or one of his assistants. But even this conference is now threatened. Mr. Stimson wishes, according to Clinton Gilbert, correspondent of the *New York Evening Post*, to substitute for it "occasional interviews in private . . . with some of the correspondents with whom he is personally acquainted and in whom he has confidence." Does the government belong to the people, to all the people, or is it the private property of the politicians who make up its personnel? Or do these politicians feel so superior to the politicians of other administrations that they need not submit to cross-examination by newspapermen who in the last analysis represent the people?

AS A CRUSADER for peace, we welcome Major General Smedley D. Butler. That much advertised officer is now to retire from the marines, at the early age of fifty, so that he can throw himself into the cause of the American Legion, or as he put it: "I am going to get busy in this Legion business when I get out where I won't get in wrong when I say things." Some choice extracts from a recent address by this charming and cultured gentleman and military statesman we take verbatim from the report in the columns of the *New York Times*:

We don't want any more wars but a man is a damn fool to think there won't be any more of them. I am a peace-loving Quaker but when war breaks out every damn man in my family goes. If we're ready nobody will tackle us. Give us a club and we will face them all. . . . There is no use talking about abolishing war; that's damn foolishness. Take the guns away from men and they will fight just the same. . . . William Penn cheated the Indians out of their land with a handful of beads and a bottle of rum, but you fellows in New England put your pitchforks up against their guns and beat them. If it hadn't been for you in 1776, this country wouldn't be worth five cents an acre. That is the way Americans do the job. It takes a hell of a lot of abuse to get us riled-up, but once we get going, look out for us. . . . No pacifists or Communists are going to govern this country. If they try it there will be seven million men like you rise up and strangle them. Pacifists hell, I'm a pacifist, but I always have a club behind my back.

How's that for an officer and a gentleman?

That Terrible British Dole

JUST how bad is this dreadful English dole, the proposed reduction of which brought about the downfall of the second British Labor government, caused the establishment of the present National Cabinet, and has already led to jubilant dispatches from Washington that the developments in London have made quite remote the prospects of our Congress's voting a dole next winter? In the first place this dole was, on August 18, the only thing which stood between 2,714,359 English men and women and starvation—620,438 more persons wholly unemployed then was the case a year ago, and approximately 1,700,000 more than when the Labor Ministry took office, just five months before the Wall Street collapse. Now, no responsible person in England's public life has from the beginning dared to suggest that the dole be wholly done away with. It has been alleged that it was too high; that it was not sufficiently safeguarded; that abuses had crept into the methods of administration; that it must be made a self-supporting system, etc. But the simple fact remains, as one of the most distinguished of British statesmen put it last winter, "If it were not for the dole, half the financiers in the 'City' would have been hanging from lamp posts before this."

Not even the recent report of the Committee on National Expenditure, headed by Sir George May, suggested the abolition of the dole. It recommended a 20 per cent cut, without apparently stopping to inquire whether such a cut would be bearable by the unfortunates who are compelled to beg their living of the government. It is utterly contrary to the fact to assert that a considerable proportion of the recipients of the dole are malingerers or work-shy. It is true, as Ramsay MacDonald himself once pointed out, that there are included in those receiving the dole many thousands of young people who have through no fault of their own never learned to work regularly, and it is also true that after years of unemployment the older people degenerate psychologically, and also physically. If one visits government unemployment offices in Europe and sees the hopelessness and the steadily increasing discouragement of initiative and vigor one can appreciate what price men pay for lack of occupation.

But how large is this soul-destroying dole? Why, it is only \$4.25 a week for each man, with \$2.25 for his wife, and two shillings, or fifty cents, for every child. Upon this vast sum of \$7.50 a week a family of four people has to exist week in and week out, yes, eat, pay rent, and buy its clothes! This is what is called "destroying men's ambition," "sapping personal initiative," "teaching men to accept support in return for idleness," "corrupting their character," and all the rest of the cant, with which those opposed to the dole fill our ears. Here is the New York *Herald Tribune* declaring for example that "the effect has been demoralizing not only to public finances but to the social and political conscience of the British people. The dole has persuaded millions that the government owes them a living; it has, by discouraging the workers' initiative in seeking new employment, interfered seriously with the fluidity of labor, and it has retarded industrial recovery." It is this \$4.25 per man a week which Ramsay MacDonald and Philip Snowden

wished to cut by 10 per cent, that is to \$3.82½, while the May Expenditure Committee (its members all rich and prosperous and affiliated with great corporations) wished to cut to \$3.40. It would be interesting to know if any one of them could keep body and soul together on such a figure. If the recipient of the dole is young and a girl, she may rejoice to receive five or six shillings a week. Yet to hear the chatter at American dinner-tables, one could readily believe that the dole is of such a size as to enable the beneficiary to attend the movies every night and to hear the opera Saturdays.

Again, few Americans realize that, in order to obtain the dole, the recipient must first prove that he is "genuinely seeking work but unable to obtain suitable employment" and that the worker, when employed, must contribute 14 cents a week to the unemployment fund, while his employer puts in 16 cents and the State 15 cents. That those sums have proved entirely inadequate to bear the burden of this unprecedented, and unprecedentedly long, period of unemployment is but natural—no one could have foreseen it. As a result the Treasury has been compelled to produce large sums to meet the dole deficit, which in turn has increased the national deficit and made it harder and harder for the Chancellor of the Exchequer to calculate what his resources will be for any twelve months. In January last the debt of the unemployment insurance fund was increasing at the rate of nearly five million dollars each week. For the four weeks ending April 25 last, the deficit was \$21,450,000 or \$5,290,000 a week. It is higher now.

Undoubtedly this is a very grave burden upon the British finances. Every outsider must wish, as well as the British and foreign financiers who are being asked to stabilize the pound and grant additional credits to the Bank of England, that it could be cut off altogether. But the fault lies not with the dole itself, as the *Herald Tribune's* shallow or dishonest reasoning suggests, but with the economic crisis responsible for the unemployment. There is hardly a price too high to pay for tiding England over this crisis. And what is the alternative? The abandonment of the dole or its serious decrease, we believe, would menace the safety of England and invite disorder and revolution. Great Britain has not America's means for drawing upon for private charity; nor have her people—or those of any other country, learned to be as generous in giving as our own. To force the bulk of the 2,714,359 British unemployed to come still nearer the edge of starvation will not only be inhuman, it will be playing with dynamite.

Especially in view of the fact that, by the passage of the MacDonald unemployment insurance bill on July 29 last, most, if not all, the abuses of the dole were eradicated, are we of the opinion that just as long as there are any other means of taxation or saving available the British dole must and should be spared. The waste for army and navy could have been cut down or stopped and other resources drawn upon. But not the dole. For the British millions who have learned that the government owes them a living are right. Any government which fails to keep its citizens from starvation will not and should not last overnight.

A Plan for Coal

WHAT shall we do about our coal industry? Let it continue to drift, as the bigger operators apparently would have it? That way lies further anarchy, and perhaps also more bloodshed and violence. The present chaotic conditions within the industry are not only injurious to the industry itself, they are a positive menace to the whole of our economic and social structure. Shall we then attempt to solve the problem simply by seeking to adjust the long-standing quarrel between the operators and miners? Will a wage agreement, however equitable, remove the causes of the industry's illness? Clearly not. Coal is not sick because wages are low. Indeed, the low wages are but a symptom of the ailment. Coal is sick because it is the victim of ruinous competition, because it has an oversupply both of mines and of labor, and because its selfish private management is completely unsocial. Production outstrips demand, and this brings lower prices and, of course, lower wages. But wages are also depressed by the existence of an oversupply of labor.

Many plans designed to correct this situation have been advanced. Many operators believe they can handle the problem if they are let alone; they want to continue the laissez faire policy which has brought the industry to its present state of virtual collapse. Others favor their exemption from the anti-trust section of the Sherman Act. Numerous disinterested and sober students of the industry see in nationalization the only hope of a permanent solution. In Great Britain, whose coal problem is similar to our own, the recently appointed Coal Mines Reorganization Commission has proposed rationalization in place of nationalization. We do not hold the British plan to be perfect beyond criticism. It has more than one defect that would have to be eliminated before it could be applied to the American industry. Nevertheless, we feel that the British plan has sufficient merit to warrant the serious consideration of the Washington Administration. It could at least be used as the starting-point for a series of discussions looking toward a solution of the problem. That is the spirit in which Sir Ernest Gowers, chairman of the commission, presented the plan to the British operators.

In brief, Sir Ernest has recommended "a policy of amalgamation" which would lead to the merging of most of the mining companies in large regional units and "reduce the number of independent concerns producing coal." His program calls for the creation of six great coal areas, each to be dominated by a single company or by a group of companies controlled by a central directorate. Each company or directorate would determine for itself where coal could most economically be produced within its territory, and each would control sales, transportation, and finances. The thousand or more coal companies now operating in Great Britain would be reduced to a mere handful; as many as 100,000 miners would be compelled to seek employment in other industries. Drastic as this appears, it seems upon casual study the best way of eliminating suicidal competition which now has the British industry by the throat. It would also tend to relieve the equally costly competition in wages. In commenting upon the rationalization plan, the London

New Statesman and Nation expressed the hope that "the commission will see the necessity of organizing these new large units as public-utility corporations rather than merely private bodies." Despite our own not altogether happy experience with public utilities, we agree that the public character of the industry must be recognized. But even as public-service corporations the coal companies would have to be most strictly regulated, and this regulatory power would of necessity rest, not with the States, but with the federal government.

One flaw remains in the British plan. Where in a country that has had an average of over a million jobless since 1920 are a hundred thousand discarded miners to find work? If the rationalization scheme were adopted in this country, fully as many as our own miners would be shunted out of the industry. Where would they find new jobs? We, too, have our millions of unemployed. Perhaps the unwanted miners would be no worse off walking the streets of Pittsburgh, Cincinnati, Chicago, or Denver than they are in their miserable coal towns today, but that is a heartless view to take of their plight. In England they have at least the "dole" to fall back upon; our miners would have only the empty Hooverian policy of self-help with which to feed and clothe themselves. Perhaps, however, a government enlightened enough to adopt for the American coal industry a scheme similar to the Gowers plan would also be intelligent enough to take the necessary measures to provide for the workers who would thus be discarded. Meanwhile we earnestly urge the government to begin work upon some sensible plan for bringing order out of the present chaos in the bituminous industry.

Frank Harris

WHAT precisely will be the future place of Frank Harris in English or American letters it is difficult to say. Most of his work seems already forgotten; at least it has been virtually ignored by the younger literary generation, and though this neglect is in large part undeserved, it seems likely that Harris himself, in the end, will be remembered longer than any of his books. His most important work was his own life and personality. That life was a stormy one, and seemed to bring him into contact with almost everyone eminent in literature from the late Victorian Age to our own.

His checkered career was foreshadowed at the age of fifteen, when he won a Cambridge University prize. As he was considered too young to enter the university, the judges gave him the second prize—\$50—and suggested that he wait another year. He replied by taking the money and shipping as a steerage passenger immediately for America. Arrived here, he followed a checkered career; he was bootblack, ditch digger, "sandhog"—until he collected enough money to move on to Chicago, where he became a hotel clerk. According to his own story, while there he met the Spanish daughter of a Southwestern ranchman, and, infatuated, followed her to Texas. He related his experiences in the Wild West of those days in a book published only last year, "My Reminiscences as a Cowboy." He professed to have known Wild Bill Hickok intimately, and to have participated in many hairbreadth adventures; he declared, in fact, that his three

great heroes were Shakespeare, Cervantes, and Wild Bill. Close students of the west described in Harris's book, however, found several important discrepancies in his account, and presumed to doubt some of his alleged experiences. But Harris's career remains full and picturesque enough even if we disregard his supposed western adventures altogether.

It was Thomas Carlyle himself who is supposed to have urged Harris to take up writing in London; it was here, at least, that he finally came into real prominence. For, becoming editor of the *Evening News*, he soon revived it from its moribund state. Later he became editor of the *Fortnightly Review*, then of the *Saturday Review*, and later still of the *Candid Friend*. In America he edited *Pearson's Magazine* for several years. Everywhere his editorship was marked by courage and forthrightness, and by an uncanny ability to surround himself with the right men. It was he who persuaded an almost obscure youngster named George Bernard Shaw to join the staff of the *Saturday Review* as dramatic critic; who hired Max Beerbohm to write essays, H. G. Wells to review books, D. S. MacColl to write on art.

Then Harris turned to a little outside writing on his own account. In 1900 he produced a very skilful novel called "Montes the Matador." In 1908 he caused a sensation with "The Bomb," the outcome of his knowledge of the Chicago labor disputes of the eighties. But though he wrote later some extremely able short stories, his real talents were rather in criticism and portraiture, and many of his liveliest pages are to be found in "The Man Shakespeare," "The Women of Shakespeare," and the several volumes of "Contemporary Portraits." His criticism was hardly what one would call impartial or judicious; his judgments of his contemporaries were marred and distorted by all sorts of crochets, prejudices, personal antagonisms, but they were unflinchingly penetrating and alive. Ten years ago, H. L. Mencken pronounced Harris's "Oscar Wilde" by long odds the best literary biography ever written by an American up to that time. Though Harris died at Nice almost in poverty, obliged at last to write for a chit-chat periodical on the Riviera for miserable pay, he found time virtually to finish his "Life" of Bernard Shaw, with whom he had quarreled for many years. It is expected that the work will be published this fall; and however wrongheaded many of its statements and judgments may prove to be, one can feel with confidence that it will contain many revealing flashes.

To the younger generation Harris is perhaps known principally for his volumes on "My Life and Loves." It is just possible that the autobiography's reputation for scandalous self-revelation, wholly apart from its comparative merit, will keep it alive longer than any of his other books. The work at least sets all of Harris's virtues and defects in a brilliant light. He undoubtedly had genius, but it was a singularly uneven genius. Pages of brilliant observation are followed by pages of appalling banality; the man seemed devoid of self-criticism. If the ordinary reader is most likely to be either thrilled or disgusted by the salacity of "My Life," the more sophisticated reader is apt rather to be amused by the curious naivete and humorlessness with which most of the sexual adventures are recited and soliloquized upon. But the work is fascinating because it sets forth, both consciously and unconsciously, a personality that, while singularly disagreeable to many, was at least one not easily to be forgotten.

On Helping Ourselves

WE are told that we must learn to help ourselves in this grave era of depression. To seek any other way of relieving the suffering and misery we see all about us would be unpatriotic. Indeed, it would, in the words of our foremost self-helper, Herbert Hoover, "break down the initiative and enterprise of the American people." Hence, we must not heed the elaborate economic plans brought forth by otherwise well-meaning economists, for their plans are based on the un-American supposition that we can best help ourselves by helping one another, and that way lies disloyalty. Nor ought we to listen to the soft words of Thomas Campbell, the wheat farmer, who would put all our unemployed in the army. Mr. Campbell thus urges government aid, or social cooperation, which is most assuredly not the Hoover or "American way."

But how are we to go about this business of helping ourselves? By following the advice of Daniel Willard, who said he would "rather steal than starve?" That, alas, would be unwise, for it would likely land us in jail, and in jail there is very little opportunity for anyone to help himself. Or shall we plant gardens and so bow to the wisdom of Henry Ford? Many of the bituminous miners tried that, but just as their vegetables were ripening this summer a goodly number of them found themselves, their families, and their household belongings dumped outside the company "patch", out beyond the barbed-wire fences where they could not reach their gardens. Recently a member of the London Stock Exchange urged that brokers be permitted to advertise their wares. He said business was bad because people were not buying stocks and bonds. Advertising, he argued, would cure all this; the people would buy good securities, and business would recover. Here is at least the germ of a splendid idea. Advertising as a stimulant to prosperity has been publicly blessed by Calvin Coolidge, and has had more than one kind word from Mr. Hoover. Why not persuade our unemployed to help themselves by advertising for jobs? That would show the rest of us whether they really wanted to work or not. And such a scheme might succeed—if only there were jobs enough to go around. Lastly, we might all go into business like the apple-vendors of last fall and winter. Apples are somewhat outmoded today, of course, and so are tangerines and candy bars. But there are other commodities that appeal to pedestrians; ice cream, for example. Only the other day a group of unemployed Chicagoans took to selling ice cream from the curbstones. Their plan worked well until the unpatriotic ice cream dealers of Chicago objected that the curbstone vendors were underselling them. Seemingly the "American way" does not mix with business.

Yet we are not without hope. We should like to have one of our more successful patriots offer a handsome prize, say a bound volume of Mr. Hoover's several speeches on the "American way," for the most practical formula of self-help. That ought surely to bring out many brilliant suggestions. However, until some such contest is held we are strongly inclined to award the palm to Mayor George D. Begole of Denver. He has suggested that the unemployed of Denver help themselves by panning the Colorado streams and abandoned mine dumps for gold!

Speaking of Revolution . . .

By HENDRIK WILLEM VAN LOON

IT happened in Los Angeles, that famous aggregation of six suburbs in search of a city. In Los Angeles all things are possible, for it is the home of Krazy Kat, yet it believes in Smedley D. Butler. And so, although the following seems incredible, those who are familiar with the city of the Little Angils will shout "Amen," for

they will know that I speak the truth.

There came unto this Pueblo (inhabited, alas, no longer by Indians) a certain foreign Professor who (yes, you guessed it the first time!) delivered a lecture. The subject of his lecture, God knows, was harmless enough. The learned Teuton spoke on the history of art, A-R-T, Art, as it is spelled in that blessed part of the land where everything is wholesome and pure and cellophane-wrapped and not a thought in a car-load. Having spoken, he went his way rejoicing to study certain of the less well known dialects which have become extinct in Europe's ancient ghettos but which may occasionally be heard along the shores of the Pacific when Directors and Magnates disagree upon the details of one of their forthcoming productions and talk to each other as if they were close relatives.

A few days later the learned man was invited to visit one of the local newspapers. The owner of the paper wished to congratulate the speaker upon the success of his brilliant discourse. Lecturers are human, like the rest of us. A little praise, as that holy man Paul of Tarsus used to say, is good for the system and one can't live on chicken-salad alone. The man of Power and Paper Pulp was most gracious. "Doctor," he said, "I hear wonderful things about that speech of yours. My wife attended it. I am too busy to go in for social functions, but I like the women to amuse themselves. Only one thing I must ask of you. In the future, please do not mention the word 'revolution'."

The Professor Doctor was greatly puzzled.

"But I talked on art," he answered. "Politics is not my *Fach*. I talked on art."

The man of Power and Pulp opened a drawer and took out a clipping. Then he read as follows: "Among other things the lecturer declared that art criticism was of very recent origin and had not been known as a separate science until several years after the French Revolution."

"There," he said, "The French Revolution . . . revolution! . . . You used the word 'revolution'."

The Professor Doctor tried to argue. "But, my dear sir," he stammered, "I used that expression because I needed a fixed date . . . just as one would say 'before the murder of Lincoln' or 'the invention of gun-powder'. . . . One does not necessarily believe in gun-powder or murder just because one happens to mention a date with which every man, woman, and child is familiar."

Power and Pulp, however, refused to be convinced.

"That has nothing to do with the case," he retorted angrily, "nothing at all. You mentioned the word 'revolution'. That word makes us see red. We don't want to hear it, and if you want to be a success in this country, let me give you a friendly warning. In the future, don't use that word. . . . Talk about everything you like, but don't mention 'revolution'!"

A certain ship went out to sea, but it never came back to port.

That ship was forced to go at full speed through an ocean infested by icebergs. Greenland ice proved stronger than Glasgow steel. And ten minutes after the collision, those on the bridge knew that the end had come.

I hate to bring up the ghastly recollection of those hideous days of waiting, but I have no choice. There has been another collision. The fanciful illusions of mass-production and the brutal necessities of our daily needs have clashed. The whole planet is still quivering from the shock. Suppose therefore that we face certain unpleasant facts and draw certain inevitable conclusions. If during those terrible hours of night when the vessel was slowly sinking, every one had been warned of the immediate danger, hundreds of other lives would have been saved. If, instead of reassuring the passengers with pleasant words: "Everything is quite all right . . . just a little mishap to the engines . . . better go back to bed . . . breakfast as usual tomorrow at eight . . ." these poor victims had been told, quietly and intelligently but firmly, "This is a serious business. Get your warmest clothes. Go out on deck and be prepared," a good many more would now be among the living.

They were drowned, most of them, like rats in a trap. They were drowned with the best of intentions. But the result was the same.

There are two conflicting schools of opinion in this year of Grace 1931.

There are those who wish to send the passengers back to bed with vague promises about "Breakfast as usual." In the meantime, help may come from unexpected sources. If it does, all will be well and the matutinal porridge will await the smiling pilgrims who will rub their hands and will slap each other on the back and say, "Quite a little scare last night! Of course, I knew right along that it amounted to nothing."

There are those who, able to learn from experience, suggest a different course of action. They do not advocate panic. Heaven forbid! They see no reason for any hasty action. They are convinced that on this occasion at least there are a sufficient number of life-boats for every one on board. And it may not even be necessary to leave the ship. But they want both passengers and crew to realize that all is not well with the ancient and trusted craft. They tell them to be prepared for eventualities. They can make up for lost sleep when the trouble is over. But just now they have only one duty—keep awake.

The Tragic Fall of Ramsay MacDonald

By OSWALD GARRISON VILLARD

MACDONALD out as Labor Prime Minister, and unlikely ever to lead his party again? That is grave news, indeed, for this embattled world. For whatever else may be said of him, here is one man who resolutely stands for peace in the world, who was determined that never should war disgrace and encrimson the globe while he held the helm of Great Britain. Never before has such a devoted and proved lover of peace, or one who made greater sacrifices for it, held one of the four greatest political positions in the world. Plenty of Presidents and Prime Ministers have given lip service, only to make war when the temptation came—did not Woodrow Wilson assure me that under no earthly circumstance would he ever permit the United States to be drawn into the World War? But MacDonald resolutely, and without a moment's hesitation, put aside all temptation when war came in 1914. Lloyd George, who had so admirably, at the risk of his life, opposed the Boer War, ratted when the Great War came. They took MacDonald up on a high mountain and said to him that if he would go along he would be one of five to conduct his country's warring, that he could aspire to—well, anything he desired. He chose the "lonely furrow" instead. He went against the war, and old friends crossed the street to avoid him. He lost his seat in Parliament in the Khaki election; his career seemed finished, over—nothing before him but the precarious livelihood of an independent journalist. Had anyone said then that this despised man would three times be Prime Minister of Great Britain, he would have been laughed to scorn.

Today we cannot stop to wonder that MacDonald heads the national government of all three parties to rescue Great Britain in her present financial crisis. The salient fact which confronts us is that this ministry is not to live more than three or four months at most; that his party has already deposed from its leadership the man who has twice successfully headed it at the polls; who has placed the whole world in his debt for his wise, his sagacious, yes, his brilliant leadership, which not only led to Locarno, but has made him the outstanding figure in the fight to keep the world from destroying itself by the madness of modern war. Wherever men's hearts are allured to the gospel of peace, wherever people aspire to the brotherhood of man, wherever those are to be found who admire a brave and fearless man ready to stake his all upon what he believes to be the right, there will be grief at the news. It is a blow to the peace movement everywhere and one that will be regretted a long time.

Whatever the final outcome, it is plain that once more MacDonald has taken the course he believed to be right at an extreme cost to himself; his career as leader of British Labor appears today to be at an end. In taking the position that the budget must be safeguarded even by the cutting of the dole, he has put himself in the position of being charged with having surrendered to the bankers who have appeared to make this the *sine qua non* of their giving Great Britain the financial aid it imperatively needs. Hence the allegation

that he has betrayed Labor's cause; hence the vote to oust him and to put Arthur Henderson in his place, as one who has stood by Labor at all costs, who has been true to the tenets of Socialism, who has refused to balance the budget at the cost of the unemployed. Let me say at once that Mr. MacDonald's defence of his action, in his radio talk of August 25, seems distinctly weak. It was that in this emergency all Englishmen will be called upon to make sacrifices in order to balance the budget, and that the unemployed should bear their share as well as everyone else, especially as the cost of living has dropped 11½ per cent; if 10 per cent is cut from the dole the unemployed will, he said, still be 1½ per cent better off than they were two years ago. But this presupposes that the dole is a luxurious grant, so adequate that the decrease in the cost of living gave a margin for extravagances.

That is emphatically not the case. The recent legislative revision was announced as having removed duplications and frauds, or excessive payments. Ordinarily the dole barely keeps body and soul together. More than that, from the Socialist point of view it is, rightly or wrongly, nothing less than treason to take toll from the unemployed when there are still taxable sources among the rich, when there are still great classes living in idleness and luxury. To this Mr. MacDonald did not refer; nor did anything he said put at rest the charge that it was a condition of the foreign bankers—with their well-known hostility to the dole—that the dole be cut. That may prove in time to be another mare's nest; the Prime Minister's statement that the proposed economies had been communicated to American authorities will only add fuel to the flames, and so will his reference to the pressure of "public opinion abroad." Even Dr. Christopher Addison, one of the ablest and most responsible of Labor Ministers, declares that proposals were made which were more than enough to balance the budget without touching unemployment pay. But, he adds, "the pistol that had been put to our heads all the time was not held in the hands of the Trade Union Congress, but in the hands of the controllers of the money market."

There stands the situation in all its stark tragedy. As MacDonald said in his radio address, he was present when the Labor Party was born. "I was its nurse when it emerged from infancy and had attained adult years"; and he assured his listeners that he had changed "none of my beliefs and none of my ideals." He admitted that he had no Labor Party credentials for what he was doing, but he added: "Be that as it may, I have the credentials of an even higher authority. My credentials are those of national duty, as I conceive it, and I obey them irrespective of the consequences." Will there be an end to this new "lonely furrow" which will be his to plough when the Nationalist Government closes? I fear not; but at least it is clear for all men to read that Ramsay MacDonald has again been ready to sacrifice his career for his beliefs. He has again proved that he places office-holding far below the satisfying of conscience, an inestimable contribution to political idealism.

None the less it is undeniable that the speed with which his party turned upon him is in considerable measure due to the widespread dissatisfaction within the party itself as to his conduct of its affairs during the nearly two and a half years that the Labor Ministry was in office. Even his severest critic will admit that Ramsay MacDonald is a great foreign minister. It has been both his strength and his misfortune that his interests lay chiefly in foreign affairs. His is not a mind which can deal with difficult economic problems; which can take a matter like the dole, or some intimate problem of finance and economics, and wreak itself upon the figures and details. These he must leave to other people. I have no doubt that the reports are correct that for six months past the British bankers have been warning him of the gravity of the crisis, that he realized its seriousness, but did not grasp its urgency. It is reported that he "hesitated too long," and that he did not dare to reveal to his own Trade Union followers all of the discouraging figures given him by the financiers. The bankers, on the other hand, were in the extraordinarily difficult position of having to communicate the gravity of the crisis to their fellow-citizens without, however, so alarming the public and foreign countries as to precipitate a crisis by causing fear abroad. That something of this kind did come to pass explains the suddenness of the Cabinet crisis. It was a bold stroke to form that National Cabinet for a limited period of political truce. If it was MacDonald's idea, it reflects credit upon the resourcefulness of his statesmanship.

What we are witnessing is another one of those tragedies of the idealist and reformer who takes high office and finds himself face to face with overwhelming responsibilities which he could not imagine when he headed the opposition and was without the responsibility of governing. If the devil has set any trap more dangerous for human beings than the wielding of great power over one's fellows, I do not know it. Is there a more dangerous virus in all the world than that injected into one's veins by the mere fact of heading a nation? It brings out at once the weaknesses, the vanities, and the desire to dominate that seem to lie dormant within the best of us. There is no doubt that there has always been in MacDonald a leaning toward domineering, and a desire, as one of his biographers put it, for "obedience rather than understanding, loyalty rather than companionship." In London one has heard of him criticisms which sounded strangely like those current in Washington about Woodrow Wilson when he was in the White House—that he was arrogant, slow to take advice or to seek it, a poor judge of men and apt to forget old friends, and wholly unforgiving when there arose differences of opinion. Nothing in my own experience has borne this out; but the volume of unfavorable criticism has been there.

Again, MacDonald feels very deeply, and easily becomes profoundly stirred as comports with his Scotch and warmly religious nature. Add to this the terrific strain of office-holding and the most difficult period in the world's history (a strain that never lets up for a single minute, not even when interrupted by brief vacations at Lossiemouth), and you have a situation to engender sparks readily. But I fancy that when some of these periods of white heat have burned themselves out he has been quick to see where he erred. The man is so high minded, so idealistic, so sure of himself and the soundness of his own principles that, like

many another similarly situated, he has found it hard, indeed, to be tolerant with those who disagreed or questioned.

None the less, when all is said and done it is a very great figure, and a noble-spirited man whose passing we are witnessing. No one can deny that he has sought to live up to the very highest ideals of the Socialist creed, even though his administration, because of its absorption in foreign affairs, and for other reasons, has failed to put through the radical socialistic reforms for which his party clamored, especially its youth. I well remember the feeling of dismay with which I left the presence of one of MacDonald's best-known Ministers in June, 1929, a month after the Government had taken office. I went to ask what radical reform was first on the carpet. The Minister stared in blank astonishment. "What, for example?" "Well, let us say the nationalization of the coal mines, or the railroads," I responded. "But, Mr. Villard, if we did that we should be thrown out of office at once." I have found many Englishmen to agree with me that, aside from international affairs, it would have been far better had the MacDonald Government early seized upon one such issue and allowed itself to be thrown out of office, and taken its chance of coming back, soon or late, with a Parliamentary majority. The only question is whether, if this policy had been followed, the international situation would not have been far worse than it is because of an interregnum by the Baldwins, Churchills, and Chamberlains. In a sense MacDonald has deliberately sacrificed the domestic fortunes of his party to international considerations. Perhaps another man, perhaps an Arthur Henderson, could have achieved great things in both fields, even though his was a minority government.

That MacDonald was born to be a leader, no man can deny. His obscure origin has been no more a handicap to him than was Abraham Lincoln's to the Emancipator. Both had the divine spark from birth. I have heard and seen MacDonald under all sorts of conditions, but I think that I was never more impressed than on that day on his eleven-day visit to America to inaugurate the Naval Disarmament Conference, when he made three great speeches. The last was the greatest. It was before a mixed group of American public men, financiers, heads of big business enterprises, and others interested in foreign affairs. He, the Socialist Prime Minister of Great Britain, was introduced by that most ardent hater of Socialists, Elihu Root, in terms of high eulogy. Never have I seen an audience of this type more profoundly impressed and stirred. MacDonald's magnificent voice was at its best, and its exquisite deep notes carried, I am told, marvelously over the radio. He looked every inch the statesman, the leader of a nation. His personal beauty, his superb stature, the whole charm of his personality, the fire of his speaking were irresistible, and no one could question the absolute sincerity and the earnestness with which he uttered every word.

So, when the history of this time comes to be written, I still have faith that however tragic his error of judgment in regard to the dole may prove to have been, history will yet write down Ramsay MacDonald as one of the great seers, prophets, and leaders of our time, all the more compelling because of the weaknesses that are part of this brave and flashing spirit, this Highland chieftain, who has three times preached to the world with religious fervor with the Prime Minister's robes about him.

Free Trade and the United States*

By HENRY RAYMOND MUSSEY

THE immediate prospects for free trade in the United States are highly discouraging. The Republicans are committed to an unbending protectionism. The Democrats, all except a few courageous souls like Cordell Hull, have abandoned all pretense at principle, and only vie with the Republicans in getting their feet into the trough. The South, the traditional home of free trade, has forsaken its position in an ill-advised and belated attempt to snatch some of the loaves and fishes for itself. Nowhere in sight is there any competent political leadership capable of making an effective business issue out of what is already a world issue of transcendent importance. It would be a bold prophet who should predict the early relaxation of trade shackles in the United States.

Yet the stars in their courses are fighting against Smoot, Hawley, and Company. Both the business interests of the United States, broadly viewed, as against the immediate narrow desires of this or that particular industry, and the needs of a world perishing for lack of opportunity to work and trade, call loudly for the beginnings of an intelligent trade policy here. As in so many other matters, so in the tariff situation, by reason of our wealth and economic power we hold the key, and if only we had the courage we might break the jam in which the world is hopelessly involved. The need is seen by all competent students and was given full official recognition in the resolution of the World Economic Conference of 1927—representing not only the League of Nations but non-members like the United States—that the time has come to move in the direction of lower tariffs. Instead of yielding to the superficial discouragements of the moment, then, the free traders of the United States (for there are a few left) ought to wage a sturdy campaign on both the business and the international front.

The general argument for free trade was so well presented by Mr. Hirst in the first article of the present series that little remains for other writers except to point out the special circumstances that render such a policy imperative in particular countries. In our own case, the basic conditions are well known, yet they cannot be too often repeated. The war threw forward the economic development of the United States by a quarter-century, but set us back politically in no less degree. Consequently our political and economic machinery is badly out of gear. Economically, the great convulsion only hastened the process by which we were rapidly passing over from the position of a relatively underdeveloped debtor country to that of a creditor state exporting manufactures. The suddenness of the transition has greatly increased the difficulty of the new adjustment, at the same time making it the more imperative in the interest alike of ourselves and all the rest of the world.

To take the financial position first, we are due, under the new conditions, to receive nearly a quarter billion of dollars annually on account of war debts, and considerably more than twice that amount on balance in interest and divi-

dends from private investments abroad. The latter sum, moreover, continues to mount because of the continuing investment of American funds in foreign securities, which investment alone has made it possible to balance our accounts in the years since the war. There are just four methods of getting payment in international transactions—by accepting from abroad either goods, services, securities, or gold. In 1929, for example, our sales of goods abroad exceeded our purchases by about three quarters of a billion dollars, and an equal amount was due us on account of war debts and net interest on foreign investments. Against this, our tourists spent something like \$565,000,000 more abroad than foreign tourists spent here; we owed more than a hundred millions net for freight; and immigrant remittances and charitable contributions came to a quarter billion more—a total well up toward a billion dollars of pay that we took in the form of services. Our net purchases of foreign securities in that year, largely in consequence of the allurements of speculation here, were cut to little more than a third of a billion. There was no other possible way of balancing the account except with short term banking loans or with gold, and we imported during the year something more than a hundred millions of dollars worth of that metal. During 1930 and 1931, with the decline in American buying of foreign securities and the falling off of immigrant remittances and other balancing items, the situation has been even worse, and the drain of gold from countries that sorely need it to the United States, which already has far more than anyone knows what to do with, has gone on in heavily increasing amounts. The existing German crisis illustrates the sort of thing that is to be expected in consequence.

Our weight in the economic world is so great that we bid fair to drag the whole world down to financial ruin if we refuse indefinitely to break the bonds with which we shackle trade. We cannot go on getting gold forever. In fact, as is suggested by the German situation, we have already passed the practicable limits of gold accumulation. Again, the past two years show clearly that we cannot always and forever count on growing American investment abroad and indefinitely expanded tourist expenditures to meet the enormous bills of foreigners here. What then? Our so-called "favorable" balance of trade—that is, our excess of value of exports over imports of merchandise—will have to come to an end just as it has done in every other country when it reached a similar stage of industrial and financial growth. To try to dam up the flow of imports by further tariff increases under such circumstances is only to court financial disaster for ourselves and everybody else.

But that is not all. Industrial conditions as well as financial demand a change. Up to the close of the nineteenth century we were relatively undeveloped economically. Agriculture was still our dominant industry, and our manufacturers were busily engaged in taking possession of our home markets, in which process they could often gain if foreign goods were shut out by tariffs. By ingenious political combinations they enlisted the farmers to back the solid manu-

* The second of a series of six articles on free trade. The third, on Germany's Gain from Abolishing Tariffs, by Dr. Karl Brandt, of Berlin, will appear in our next issue.—EDITOR THE NATION.

facturing phalanx in favor of protection. Meanwhile our great staples, the foodstuffs and raw materials of industry, were eagerly received by Europe, which in return not only sent us a great variety of manufactures that we did not yet make ourselves, but also in payment invested great sums in our railroads and industrial enterprises, to our gain and theirs alike.

By the turn of the century a great change had come, and a rapid shift in the industrial balance had begun. Machinery of all kinds, petroleum products, refined copper, the coarser textiles, automobiles, and dozens of other manufactured products began taking their place in our export manifests along with the familiar wheat and cotton and naval stores and beef and pork products of our first three hundred years. Wherever cheap materials, mass-production methods, and extensive application of machinery counted, American manufacturers not only appropriated the whole home market, but sent their products into neutral markets and into Europe itself.

But when this occurred, the tariff phalanx was broken, and the Democrats had a relatively easy time in passing the Underwood-Simmons tariff in 1913, with important export manufacturers indifferent to lower rates or actually in favor of them because what they wanted was lower costs and not utterly unnecessary protection in the home market. Free lumber, coal, leather, wool, boots and shoes, and crude iron and steel products, with reduced rates on many more advanced products, represented in fact a first installment of what might well have developed, but for the war, into a vigorous and salutary free-trade movement. The war, with its exacerbated nationalism, with its practical embargo on imports from Europe, and with the utter disorganization of trade and finance consequent upon the struggle, made possible the emergency tariff of 1921, the Fordney-McCumber abomination of 1922, and the Smoot-Hawley monstrosity of 1930. But one fact should never be forgotten. Some of the most effective opposition to the last-named measure came from American sugar manufacturers operating in Cuba, from automobile makers who waged relentless war on the measure all the way through, from the United States Steel Corporation, which actually killed the manganese duty after the House Committee had accepted it, from the great oil companies, which successfully resisted the enactment of any duty on crude petroleum, and from other export manufacturers who did not want the purchasing power of their foreign customers lessened. The bankers who finance these manufacturers and that other great group of international bankers whose concern is with the smooth flow of the currents of international trade and finance stood behind them and stand quietly today for trade liberalism. The growing power of our export manufacturers is suggested when one remembers that the proportion of Australia's imports of manufactured goods coming from the United States rose from 14 per cent in 1913 to 24.6 per cent in 1929, while corresponding figures for the proportion of manufactured exports drawn by other countries from the United States are: Argentina, 14.7 and 25.4 per cent; Chile, 16.7 and 33.9; Japan, 16.8 and 29.5; China, 6 and 18. In the face of such a showing it is plain that protection has become a policy for industrial cripples in this country, and that our really vigorous industries are likely increasingly to favor a policy of freedom. Our economic situation, as well as our financial situation,

dictates such a policy with constantly increasing insistence.

On the business side the United States would have everything to gain and very little to lose by a rapid movement toward free trade. The first steps would naturally be taken, as they were taken in 1913, by a mere cessation of the process of raising effective rates, by a sweeping away or lowering of duties that are superfluous or excessive, and by a further freeing of foodstuffs and materials. Such steps would in themselves produce no notable results, but would serve notice on the world that the United States no longer proposed to continue its efforts to make trade progressively more difficult if not impossible. Such notice from such a source would exercise a strong, it might well be a determining influence toward reversal of the suicidal policy of trade restriction that all countries have increasingly followed since the war.

Predictions of industrial disaster from action of this kind are idle. It would mean at once the strengthening of American industry and the increase of American trade, and at the same time would bring similar gains for other countries. Take, for example, the bloody angle of the tariff controversy, free wool. As the brief pre-war experience under the Act of 1913 indicated, a rapid adjustment of wool-growing and woolen manufacturing might reasonably be expected, under which the quality of American clothing would be improved and its price perhaps somewhat reduced. The buying power of wool growers abroad, who produce in great quantities many grades of wool not grown here at all, would be increased, as would that of all consumers of American woolsens. Experience indicates that the American sheep industry, with its joint production of wool and mutton, while it might be to some extent unfavorably affected in those regions which grow sheep prevailing for their wool, would not be destroyed or even threatened, and it would cease to be a parasite on industries that stand on their own legs. It is doubtful whether the increased competitive power of our woolen manufacturers would injure even the foreign producers of woolsens, for the simple reason that the increased buying power of wool growers and woolen consumers might well take off the market a distinctly increased quantity of woolen goods. The specific situation differs in various industries, but the general argument holds, and it may be confidently asserted that a rapid movement toward free trade, if directed with reasonable intelligence, could be made in the United States at the present time, not only with a minimum of industrial disturbance, but with definite benefits to agriculture and manufacture alike, and with some gains to the consumer. The shaping of the details of such a policy at each particular point of time might well be in the hands of an expert commission, which would of course be hampered by no such silly formula as "equalizing the cost of production at home and abroad," but the essential thing would be the policy itself. The immediate and direct gains to consumers would be far smaller than is often represented, for the double reason that the mythical billions by which the tariff mulcts consumers through the direct raising of prices do not exist, and that if they did it would be impossible to slash the rates without widespread industrial disaster; but there would be some gains, as in the case of woolsens above suggested. The great benefits, however, would be indirect, and would come largely with the increased buying power of foreigners, who would again be able to count with rea-

sonable certainty on an American market if they had built one up; for we should have ceased to contemplate deliberately slaughtering foreign industries, as we slaughtered the Swiss watch and clock industry, for example, in 1930.

By making it possible for trade currents to flow again between countries, instead of being dammed up within national boundaries, which has been the tendency of almost all post-war tariff legislation everywhere, we should do the most important thing possible to restore the smooth working of the gold standard, on which the financial and industrial stability of the whole western world, including our own country, so intimately depends. As it is, we bear a primary responsibility for the spasmodic and disastrous gold shipments that must occur whenever the investment movement is in any way interfered with. By its contribution to financial stability and to the consequent restoration and development of world commerce, the very first step toward a liberal

trade policy by the United States would have a value for the reestablishment of world prosperity and peace wholly out of proportion to any of its immediate direct consequences. It would be worth more than a dozen haggling and bargaining international conferences in which the representatives of each state try to get the better of the others. In fact, without such action, all the conferences in the world cannot get very far. Furthermore, in taking such action we need not wait for the aid or consent of any other nation. One hundred per cent Americans can join hands with the rankest internationalists in putting through a policy that is demanded at once by the interests of our own country and by the needs of other lands imperiled by our present shortsighted, selfishly and individually greedy, and ultimately suicidal policy. Do Americans really care for peace and prosperity at home and abroad? If so, let them remember that the most effective means of promoting it lies entirely in their own hands.

Making Mexico Jew Conscious

By ANITA BRENNER

Mexico City, August 15

WE have become accustomed in recent years to discovering business wars under movements with patriotic or humanitarian labels. We have also been obliged to discount demagoguery which blames the crisis absurdly on some one nationality, race, religion, sex, or event. The anti-Jewish movement recently started in Mexico reveals some of these familiar modern phenomena, against a semi-medieval backdrop. Medieval, because a Jew to ninety-nine out of a hundred Mexicans is a wholly mythical fiend, horned, black-souled and somewhat cannibalistic; but a medieval Christian could pick his target in a crowd, whereas only the hundredth Mexican supposes that Jews sometimes take on human form.

Thus mass anti-Semitism in Mexico is pure folk-lore; and the anti-Jewish movement is a campaign to inject into this folk-lore the sullen and always latent Mexican resentment against foreigners of the sort called invaders, heretofore usually identified as Spaniards or Americans. The object of this campaign is to get the Jews out of the drygoods business—why, a brief account of what they have done to it will make obvious.

Jewish migrations to Mexico began when the quota laws were passed by the United States. In August, 1924, General Plutarco Elias Calles issued as president-elect an invitation to Jews detained in European ports; he offered consular facilities, reduced railroad fares, and a welcome, requiring only that immigrants obey Mexican laws. The invitation suggested that Jews engage in agriculture through colonies; it promised to help start such colonies, and added that there was also much room for small industries (cloaks, suits, shoes, etc.) and that the drygoods business was young.

Like most other enterprises in Mexico, except politics and farming, the drygoods business was almost entirely in the hands of foreigners, who dealt chiefly in foreign goods. Drygoods, clothing, hats, and cosmetics, were imported from France and sold by Frenchmen. Shoes and stockings came from the United States; woollens from the United States and

England; hardware and machinery from Germany. Spaniards controlled the grocery and book trade. The native industries consisted chiefly of Indian crafts. There were a few textile, shoe and candy factories which, like larger enterprises in Mexico (oil, mines, fruit, coffee, beer, cigarettes) were owned and run by foreigners. Big retailers bought directly from foreign factories as wholesalers and sold themselves the goods. Small retailers bought from wholesalers sometimes local, who in turn may have bought from foreign middlemen—which method, what with fairly stiff tariffs and unfavorable exchange, brought the cost to about twice as much as American retailers are accustomed to pay for the same grade of merchandise. Local factories imported much of their material, and kept their prices just under the level of foreign merchandise. All retailers practised an old-fashioned system of business—markups yielding at least 100 per cent profit, usually more, on a strictly cash basis. Given the extreme poverty of Mexican masses, the pinched state of the lower middle class, and the uncertain pockets of government employees—a large proportion of Mexico City population—the clientele of the drygoods and clothing stores was limited to the prosperous, especially as no attempt was made to supply wares of a cheaper than medium grade.

Doubtless General Calles had these conditions in mind when he shrewdly welcomed the Jews. Proposed negotiations of his government with American Jewish organizations for the financing of agricultural colonies fell through, possibly because the Mexican agrarian problem was not then solved enough, nor is it yet. But the Jews did not wait. Thousands, mostly young men, sailed hopefully for Vera Cruz. Until 1927 the doors were wide open. Authorities asked no questions, barred none but the sick and criminals. After 1927 they asked questions, but stated no preference as to occupation, nationality, or religion. Recently, following American example, restrictions, questions, and requirements have multiplied. The bulk of the Jewish population arrived between 1924 and 1927; the incoming stream has since become a mere dribble, partly because of the change in laws,

but more largely because of advice to stay away given by local Jews and by international Jewish organizations.

There are now from fifteen to twenty thousand Jews in Mexico. About half are European (Ashkenazic) Jews—Russians, Lithuanians, Latvians, Czechoslovakians, Poles, Austrians, Germans, Russo-British; the other half are Oriental or Sephardic Jews—from Smyrna, Salonika, the Balkans. Some of these are French citizens. The majority of both kinds have become Mexican citizens. About three-fourths live and work in the capital and its surrounding Federal District. The rest are scattered; they peddle even in the remotest Indian villages.

Presumably these thousands were attracted by the variety of possible occupations pictured by General Calles, and by the guarantee of a friendly government. Certainly, too, by the proximity of the United States. Many took the land promise literally, and came enthusiastically determined to be farmers. But they found that if they had or could get money they could buy huge estates liable to be distributed among insistent agrarians; and if they had no money, they could farm on the Indian level—maize field, straw hut, fifty cents a day at best. In either case they would face intricate and dangerous problems.

Some of the stiffnecked, determined to farm, compromised by starting small dairies near the capital. Occasional jobs as foremen of estates in the hot country were also eagerly taken. A few of the very stubborn Jews turned peon and got malaria. The rest peddled. They peddled neckties, socks, stockings, scarves, knickknacks, saints. Then they enlarged their packs and sold clothing, drygoods, hardware. The less prosperous tried to get union cards; some did, and worked in factories. Others drove taxis. The more prosperous got market licenses and established themselves in booths at city markets. Others, with the aid of small loans from the B'nai B'rith, which was operating an emergency immigration station in Mexico City, opened small stores or "factories"—tailor, shoe, mattress, furniture, sweater—some of which have grown considerably. They sent for their families, or founded new ones.

Within seven years Mexico City has a Jewish "zone"—streets of Jesus Maria, La Santisima, Correo Mayor. There are Jewish residents on almost every street, kosher restaurants, butcher-shops, and delicatessens, a Young Men's Hebrew Association, a Jewish charity organization, a Yiddish theatre, a newspaper, a Jewish Chamber of Commerce, the beginnings of a hospital—and an anti-Jewish campaign. The city also has a sweated labor class, stenographers and middle class wives clad far more neatly, and a new class of manufacturers and merchants, who aim at providing cheap wares for the unprosperous. Small expenses for licenses and rental of booths, long hours, and shrewd buying directly from foreign or local factories, contribute to the Jews' success. But the decisive factors are the two radical innovations which have revolutionized the drygoods business—small profits on large sales, and the introduction of a retail credit system and installment plan. The markets have been transformed into open air department stores, prices have gone way down, and the number of buyers has gone way up. Furthermore, some of the old customers of the large stores have shifted their patronage to the markets and to installment-plan peddlers.

Obviously the department stores, and the shoe and hat

stores accustomed to the old system of buying and selling, do not like it. Neither do the shoe factories and tailor shops which have to compete with the Jews' cheaper products. It is true that several of the large importers sell considerable amounts wholesale to Jewish retailers, but they cannot be otherwise than irritated when the Jews sell this merchandise for much less than the retail departments of these importers. As a rule, however, the class of merchandise handled by Jews is below the quality of the class offered by department stores; but the rub lies in the fact that far more people in Mexico will buy cheaper goods, because few can afford better.

Came Depression. Came the drop of silver, hitting importers squarely in the diaphragm; and the Jews, producing locally, went cheerfully on, pulling down prices and making money at it. The old guard, unwilling to adopt the Jewish system, aghast at the thought of cutting their own prices, establishing credit, selling on installments, timid about advertising—in short, unable to compete intelligently—looked around for another solution. Then came the expulsion from the United States of thousands of Mexicans, causing an uneasy, humiliated anger and forecasting serious unemployment problems. As an expression of both, Guatemalan workers were expelled from southern Mexico and the press grumbled about the Jews. Meanwhile American tariff laws were creating in Mexico, as elsewhere in the world, a bristling, desperate nationalism, in Mexico aggravated by the silver problem, the unemployment problem, the agrarian problem, the labor problem, the collapse of oil and mining, and the familiar, heartbreaking misery of the majority of the population.

Brave but inadequate remedies developed: the pushing of roadbuilding, the soothing of agrarians, the encouragement of tourist travel; the Chambers of Commerce campaigned for the slogan "Consume National Products." The irritated French, Spanish, and German shoemen, hatmen, drygoods, clothing, and hardware merchants dovetailed this praiseworthy movement into another, labelled, "Buy From Mexicans—Boycott the Jews." They began by organizing numerous *Ligas*—such as the League of Shoemakers and Tanners, the League of Mexican Bazaars, the League of Small Merchants Adhering to the National Revolutionary Party—the membership of which is made up chiefly of employees of the large enterprises, the owners of smaller enterprises, and a minority of Mexican peddlers and small business men, who followed the Jewish example of taking novel wares into the streets and markets, but who, with less business experience and much competition, were not as successful as they had hoped. Some of these *Ligas*—for example, that of the shoemakers—are enormous numerically; others have no membership beyond an organizer and his committee of agitators.

Propaganda in the form of "manifestos," placards, pamphlets, and megaphone men appeared in the markets and streets. The press, especially the *Nacional Revolucionario*, official organ of the official National Revolutionary Party, gave ear to these clamors. The Jews were accused: (1) of having entered Mexico under false pretenses—promising to work the soil, and then engaging in other occupations; (2) of "disloyal" commerce, selling below cost, wholesale smuggling, stealing, and fraudulent bankruptcies; (3) of exploiting Mexican labor, even of torturing Mexican labor—one Jew was said to hang his girl clerk up by the thumbs—of

not hiring Mexican labor, of cheating their customers, of not paying taxes, of snatching bread out of Mexican mouths; (4) of living in poverty, of getting rich and sending their money to Palestine; (5) of sinister designs on the future welfare of the nation. The government was petitioned: (1) to expel all the Jews; (2) to cancel all Mexican citizenships extended to Jews; (3) to force them all to become farmers; (4) to cancel Jewish peddlers' licenses and expel Jews from the markets; (5) to restrict Jewish immigration.

Political sponsorship of the anti-Jewish campaign was arranged with Deputy Angel (angel) Ladrón (thief) de Guevara, ex-general, representative from the Federal District in the National Chamber of Deputies, prominent in the National Revolutionary Party and said to be "close to Calles." Promptly the manifestos, pamphlets, and threats multiplied; a violently anti-Jewish sheet called *La Voz del Comercio* was distributed, along with the other literature, from the offices of the Federal District Deputation in the National Revolutionary Party headquarters. And letters on National Revolutionary Party stationery, signed Ladrón de Guevara, asking how much the Jews would pay to stop the campaign, were received by several local Jews with presumably likely bank accounts. The letters were not answered.

Then immigration authorities at Vera Cruz began to get nasty to Jews; Jewish peddlers' licenses were cancelled, and all Jews, Mexican citizenship notwithstanding, were expelled from the big drygoods and clothing market, *La Lagunilla*, under rulings stated to be for the purpose of clearing the markets for homecoming Mexicans expelled from the United States, and of enforcing market regulations which provided that no merchant with more than three hundred pesos (under \$150) worth of goods be allowed to deal there. All Jews were said to have violated this regulation. No Mexican or non-Jewish foreign violators were discovered.

To celebrate the exodus, a mass meeting was held by the anti-Jewish *Ligas*. Anti-Jewish placards decorated the locale, anti-foreign and anti-Jewish speeches were made. The President, who attended, was oratorically asked to "sink the national flag through the heart of Israel." Deputy Ladrón de Guevara received a gold medal from one of these *Ligas*, "for his patriotic work in initiating the nationalistic campaign." The medal was pinned on him by amiable President Ortiz Rubio himself, who apparently was present under the impression that the meeting was "pro-National Commerce," and who doubtless didn't see or hear anything naughty, because in answer to an inquiry from this correspondent he telegraphed that there was no anti-foreign campaign in Mexico.

Interviewed, the talkative Deputy stated to this correspondent, and to a representative of the New York *Evening Post*, that his campaign was directed "against all the children of Israel." Asked whether he thought they were all bad, he answered, either tactlessly or because he doesn't know a Jew when he sees one, that he thought they mostly were. Asked what precisely he expected to do to them, he said, "Send them all out of the country. I've already had the pleasure of personally expelling them from the markets." Asked how he was going to accomplish his object, he said the President would sign decrees of expulsion for them all. Asked what he would do if the President did not, he said,

"I'll apply direct action; after all I'm a Deputy and can't be thrown in jail." Asked who his allies in this campaign were, he said, "the National government, the Federal District government, and the National Revolutionary Party." He also named several large department stores. Asked how long it would take to expel the Jews, he said, "Within sixty days Mexico will be clear of them."

His activity, stretching over a period of several months, reached a climax June 1 with the organization of a monster parade, intended to show the government how much Mexicans hate Jews. The Jewish zone prepared itself for a pogrom. Anonymous letters threatening forcible expulsion and "suppression" were received by some; and the memory of blackmail attempted by an industrious ex-general named Viguri V, upon others, plus multiplied and more violent placards, megaphone men offering "a nickel for every blow at a Jew," and a new and very wild issue of *La Voz del Comercio* headlined "Jew—On Your Way," portended a near and dreadful fate to the excited immigrants, many of whom have experienced persecution on the European plan.

The President was asked to decree the Day of Commerce—invented for the parade—a national holiday. University students, discovering a receipt for a thousand pesos given by a prominent drygoods and clothing firm to one of the signers of anti-Jewish placards, protested. The Jews protested. One or two diplomats tactfully regretted. Queried for comment, General Calles did not reply. However, the holiday was not decreed, but permission was given for the parade, and an imposing number of *gendarmes* turned out with fixed bayonets to keep it peaceful. Nothing happened. Twenty thousand, it has been calculated, overalled "business men" marched down the main boulevard and through the heart of the city, carrying signs in most of which the word Jew had been hastily and visibly exchanged for "Bad merchant," "Pernicious stranger," "Invader," and, innocently, "Israelite."

Delegations which petitioned Mexico's cultured, amused Foreign Minister, Señor Genaro Estrada, to cancel the citizenships of Jews, were told that the citizenships were legally issued and would not be cancelled, and were informed that delegations with petitions like theirs ought to know that they were being used as tools by other foreigners. Then the able Secretary of the Interior, Señor Carlos Riva Palacio, interviewed by this correspondent, declared that immigrants engaging in other occupations than those described upon entry were violating no law, and would not be expelled unless they violate one. He declared, furthermore, that the government did not endorse the anti-Jewish campaign, and that the Deputy engaged in it represented no part of the government except himself.

These declarations, headlined in the leading daily, *Excelsior*, cleared the air and reduced the anti-Jewish bogey to less alarming proportions. Later, representatives of the shoemakers, a majority of the paraders, politely begged this correspondent to note that Deputy Ladrón de Guevara was not empowered to talk or act for them, and as for them, they were only against foreigners engaged in the shoe business, guilty of selling too cheap; they calculated there were about thirty thousand such, whom they called Jews because that was the Spanish idiom for bad merchants, and they asserted that they were not anti-foreign at all; in fact there were lots of foreigners in their organization. Lots of Spani-

ards. No Jews. They were thinking about taking in some Armenians.

Propaganda still simmers, and sometimes flares in the *Nacional Revolucionario* and minor yellow journals. Jews who can are leaving; others, pitiful and confused, make life complicated for the passport department at the American Consulate. Several hundred, still with peddling and market licenses cancelled, are out of work, and cannot seem to get any action from the Federal District government, which issues such permits. Those who have a little money migrate to nearby cities, where they are followed by propaganda and soon beset with difficulties; many are desperately hungry.

Help is expected from American Jewish organizations. An appeal has been made for emergency funds and for loans with which to establish ousted peddler and market Jews in

small shops. The establishment of special markets for Jews has been suggested by government officials, but Jews here oppose the idea for fear of creating a ghetto, with its implication of danger. It is scarcely likely that they will be readmitted to their old corners, and even if petty officials should turn suddenly lenient, the reentry of Jews would provide a target for continued attack, which might otherwise possibly die down. It is also unfortunately possible that funds may still be forthcoming for the generals in this little war, and eventually the foreign patriots who back it may persuade the impulsive Mexican masses that foreign merchants who sell cheaply on the installment plan personally murdered Christ and are to blame for the evils of this world; in which case Mexico will have her first pogrom since the Inquisition. And it won't be a little one either.

The Black Bugs

By HORACE R. CAYTON

I SAT eating in a small restaurant in the heart of the Black Belt of Chicago. As I finished my somewhat greasy steak and started on the "home-made apple pie," I chanced to look out of the window and saw a number of Negroes walking by, three abreast, forming a long uninterrupted line. What impressed me about them was not only that they were marching by in a serious and determined fashion, but the poverty of their dress and their unkempt condition. Not that it is unusual to see in any section of the Black Belt unkempt Negroes rubbing shoulders with the well-to-do "black bourgeois," but to see a whole orderly procession of them, to hear no loud laughs, no good-natured horseplay—well, that was different. The situation needed looking into.

On going outside I was informed that they were the "black bugs"—the Communists—the "black reds." Oh, so Mr. Fish and his calamity shouters were right. Indeed the Communists, it appeared, had been active with the black brethren. Here at last was a bit of concrete evidence that the fundamental institutions of the country were in danger. Here was evidence of the "red scare" which had kept many a corrupt municipal government, from New York to Seattle, in power a bit longer, and delayed grand jury investigations. I would accompany this band of black demons too, if not to protect our glorious institutions, at least to see them in part destroyed. I fell into line and marched.

Turning to my marching companion I asked where we were headed for, and what we would do when we got there. He looked surprised, and told me we were marching down to put in a family who had been evicted from a house for not paying their rent. Things were awfully tough down in the Black Belt now, he continued, and jobs were impossible to get. The Negro was the first to be discharged and the last to be hired. Now with unemployment they were hungry, and if they were put out in the street their situation would be a desperate one. The Negroes of the community had been exploited for years by the unscrupulous landlords who had taken advantage of prejudice compelling the Negroes to live only in that district, and had forced them to pay exorbitant rents. Now, continued my informer,

hard times had hit them and they were being turned out into the street. Furthermore, as the Negroes did not know their legal rights, the landlords would simply pitch their few belongings out of the window with no legal procedure at all. They, the Communists, were going to see that the people were not treated in this fashion.

Need I say that my reaction was one of surprise and disappointment? Instead of trying to destroy our splendid and glorious institutions, these poor black folks were simply going over to put a fellow race member back into the house he had been unceremoniously kicked out of. This was indeed a come-down for one who had expected to witness the destruction of constitutional American principles, such as, for example, "due process of law."

We finally came to a dirty, ill-kept street of houses. The first part of our line had arrived ahead, and had successfully put back into the house the few miserable belongings of the evicted tenants. The woman of the house was standing, surrounded by a group of "black reds," intermittently crying and thanking God, loudly and dramatically. Her audience was very responsive, and seemed about to break into shouts itself. It was pathetic to see this old black woman thanking God for aid which came in the form of a group of so-called Communists—and the emotional responses of the Communists themselves reminded me more of a camp fire meeting than a mob of angry "reds." Evidently not all Communists, at least not all black Communists, are atheists.

Suddenly a shout went around that there was another family in the next street that had been put out, and the procession started in that direction. This time I was far in the front to see the fun. We were met at the street by two squad cars of police who asked us where we were going. The black crowd swarmed around the officers and their cars like a hive of bees around their queen. The officers jumped out of their cars and told the crowd to move on. No one moved. Everyone simply stood and stared at them. One officer lost his head and drew his gun, leveling it at the crowd.

Then a young fellow stepped out of the crowd and said, "You can't shoot all of us and I might as well die

now as any time. All we want is to see that these people, our people, get back into their homes. We have no money, no jobs, and sometimes no food. We've got to live some place. We are just acting the way you or anyone else would act."

The officer looked at the boy, at the crowd, and the crowd looked at him. No threats, no murmurs, no disorder; the crowd just looked at him. There the officer stood, surrounded by a crowd of dirty, ragged Negroes with a sea of black eyes on him. The officer replaced his gun in his holster and stood looking.

In the back of the crowd some one got up on a soap box and started to speak. It was an old, wild-eyed, hag-like woman. The crowd turned and listened to her.

I have heard lots of radicals talk. I have attended the meetings of Anarchists, Socialists, I. W. W.s and Communists. I understand, more or less, the rituals of Karl Marx, Lenin, and the rest. I am familiar with the usual harangue of the "soap boxer"—but this was different. This woman was not talking about any economic principles; she was not talking about any empty theories, nor was she concerned with some abstract Utopia to be gained from the movement of the "lower classes." She was talking about bread, and jobs, and places to sleep in. It was the talk of a person who had awakened from a pleasant dream to find that reality was hard, cold, and cruel.

Then I realized that all these people had suddenly found themselves face to face with hard, cold reality. They were the people who a few years ago had migrated from the South, in wagons, in cars, in trains, even walking. They had migrated with songs and hymns on their lips—with prayers to the Almighty for deliverance. They had come to the North and had been welcomed. Ah, America's great pool of unskilled labor was tapped; they had been sent to help win the war. But pretty soon the war was over. And, later still, the good times and prosperity were over. With hard times they had felt the pinch of poverty, and now they were virtually starving to death in the paradise of a few years ago.

The talk went on. The crowd stood and listened. It had grown bigger now and many white faces were seen. The officers stood and listened. I don't believe that there was any one there who was not touched by the talk. I don't believe that there was anybody there, white or black, who did not in some degree face the same situation that she was so vividly describing. Even the officers stood with more or less respectful attention. I spoke to one of the officers and asked if he didn't think it was a shame to put people out of their houses when they were in such desperate circumstances. He answered that it was tough, yet a man didn't build a house for charity—but it didn't make any difference to him as long as they started no trouble.

Just then a siren was heard—the whisper went around—the riot squad was coming!

"Hold your places, comrades," shouted the woman speaker.

"Act like men," came back from the crowd.

All of the spectators stepped back, and the active participants formed a small nucleus around the speaker—packed in tight—a solid black lump of people. Two young fellows stood holding the woman up on the soap box in the middle.

Then the riot squad turned into the street, four cars

full of blue-coated officers and a patrol wagon. They jumped out before the cars came to a stop and charged down upon the crowd. Night sticks and "billies" played a tattoo on black heads.

"Hold your places," shouted the woman.

"Act like men," answered the crowd.

They stood like dumb beasts—no one ran, no one fought or offered resistance, just stood, an immovable black mass. Finally the officers were through, and started to pull down the woman speaker. Clubs came down in a sickening rain of blows on the woolly head of one of the boys who was holding her up. Blood spurted from his mouth and nose. Finally she was pulled down. A tremor of nervousness ran through the crowd. Then someone turned and ran. In a minute the whole group was running like mad for cover. One of the officers shot twice at one of the boys who had been holding up the woman speaker. The boy stumbled, grabbed his thigh, but kept on running. The woman was struggling in the arms of two husky policemen. It was all over in a minute, and all that was left was the soap box and the struggling black woman. I turned and left. Tomorrow I will perhaps read in the paper that a "red riot" was stopped only with the intervention of a number of officer; that "red" agitation among the Negroes is on the increase; that Mr. Fish, Mr. Hearst, and Mr. Jimmie Walker were right—American institutions really are in danger.

In the Driftway

WITH the great American passion for framing lists —The Ten Greatest Thinkers, the Ten Greatest Poets (vide Will Durant's latest opus), The Ten Greatest Living American Women, and so on and on, the Drifter wonders why he has not yet seen any list of The Ten Most Obnoxious Words. Most persons, the Drifter imagines, if asked to compile such a list, would be embarrassed. For most of them would suppose that they were being called upon to set down the words which each of us has been taught to believe are so obnoxious to all the rest of us—those four-letter Anglo-Saxon words celebrated by Joyce in "Ulysses" and Lawrence in "Lady Chatterley's Lover," and sometimes used in private conversation by less distinguished persons. Any one of candor, however, or at least (what is sometimes the same thing) any one capable of recognizing what his own feelings and emotions really are, as distinguished from those that are generally considered estimable or appropriate, will probably admit that most of these words are not really revolting to him. On the contrary, they are precisely the words that come to his lips spontaneously, and even irresistibly, when he has lost his temper; which clearly shows that, so far from being distasteful to him, they give him a curious satisfaction that no other words in the whole English language, in just that situation, could provide.

* * * * *

THE officially obnoxious words, in short, are seldom the personally obnoxious ones. The words that annoy and irritate one personally will depend to a large extent on one's temperament, and on the nature of one's experience and in-

terests. If the Drifter were to compile a personal list, for example, it would certainly include such words as *creative*, *organic*, *dynamic*, *vital*, *complex*, and *psychosis*. The Drifter is willing to admit that his distaste for these words is sometimes an irrational one, for each of them surely has an entirely legitimate use. It is when they are used pretentiously, honorifically, and vaguely, as they are coming increasingly to be, that they arouse the Drifter's ire. Why must every person with a sense of inferiority now be described as having an inferiority *complex*? In nine cases out of ten the word *complex* adds nothing but the self-conscious intimation that the person using it knows a thing or two about psychoanalysis. Why are so many writers convinced that they have said something profoundly significant when they are told us that we must take an *organic* view of this or that subject? Why? . . . But the Drifter is becoming indignant, and indignation is alien to his nature.

THE DRIFTER

Correspondence

France Does Not Want War

TO THE EDITOR OF THE NATION:

SIR: No, France does not want war. There are Marins and Maurrases in France: but they are not "France": they are not even "official France." Official France is Briand, and Maurras is openly calling for his assassination. The failure of liberals in this country to understand and support the most conciliatory of European statesmen is a tragedy.

We must strive to escape from nationalistic thinking. Mr. Dell and *The Nation* are not against France: they are with Leon Blum, with Daladier (!), with Barbusse, with Rolland, just as much as they are against Hitler or Pilsudski.

What is to be done? Certainly not to attempt to coerce or isolate France: but to attempt to understand. I, as a pacifist and as an internationalist, can see much that is reasonable in her contentions. Meet her reasonable demands: the unreasonable ones will fall of their own weight. The cry for *security* is not hysterical: we must have an organized world if we truly want disarmament and peace. So long as we are out of the Court and out of the League, we are giving an example of "sacred egoism" which strengthens the "sacred egoism" of others. The mote and the beam: at present, we, who officially stand for international *anarchy* (in the literal sense of the word), are the obstacle. If Mr. Hoover hopes to settle the disarmament and the financial problems without international commitments, he is bound to fail.

I heartily agree with the conclusions of Mr. Robert Dell: the principle of equality would appeal to the sense of logic and fairness of the French. I am surprised we are not working it up for all it is worth: here at last is a definite, positive suggestion. Peace can not be based on supremacy: neither French supremacy on land, nor Anglo-Saxon supremacy on the high seas. We, who obviously do not need as large a navy as Great Britain, have claimed and secured parity. Italy, whose colonial interests are trifling compared with those of France, is claiming parity with France. Germany will be satisfied with nothing less. The principle of equality is absurd if you like: but it is workable. What are the alternatives? A race for armaments, and the survival of the fittest? We have tried that way: it leads to Hell. An adjudication of the "needs" of each nation? By whom, and on what basis? Do you think that America would stand for a moment a definition of her "needs" by an

international body? The Washington method: "freezing" armaments, not at their present level, but in their present proportions? Aye: but that should work both ways: if it consecrates the naval supremacy of France? And is not that exactly what we are seeking to avoid?

Let us *all* reduce to a common level—say, for a start, the one imposed upon Germany by the Versailles treaty. Both Mr. Hoover and Mussolini have said emphatically that no figure was too low for them—provided no one else was entitled to a larger one. This means the total abandonment of the "Britannia rule the waves" policy and the two-power naval standard. Messrs. MacDonald, Baldwin, and Lloyd George united recently in a demonstration against excessive armaments: are they willing to accept the consequences?

The French are not ghouls: they are clear thinking people. They will never understand why we should insist upon disarmament without mutual guarantees; and why France should give up her military superiority whilst England would be confirmed in her naval superiority. Meet these two problems: America's (alleged) refusal to cooperate, England's reluctance to admit other nations to full equality, and the French difficulties will be automatically settled.

Stanford University, Cal., August 5 ALBERT GUÉRARD

West Virginia Coal Mines

TO THE EDITOR OF THE NATION:

SIR: I have just completed a health study for the Emergency Committee for Strikers' Relief, of the children of the coal miners of the West Virginia Miners' Union. In Ward, where work has been fairly steady, I found that the average weight for all the children was 12 per cent below the standard and that a diet consisting of pinto beans, potatoes and sow belly (salt pork) had resulted in lowered resistance to all types of infection such as colds, middle ear infections, and tonsillitis. In Gallagher, where work was not steady, conditions were far worse. There was, for example, a higher incidence of such preventable diseases as scarlet fever, diphtheria, and typhoid.

There is an attempt on the part of the public school authorities in these mining camps to provide inoculation against preventable diseases, but the children of the miners are unable to attend school after the first few weeks of autumn because they have no shoes for the long hikes to the school building. As a consequence they receive none of the benefits of public health service as carried out in the school. None of the children I examined had been given milk of any kind after they were weaned, nor had they known fresh meat or vegetables except on very rare occasions. Their only change from the diet described above was berries gathered from the woodlands near their camp.

The average family in Gallagher consists of seven persons; in Ward, of nine, due to the fact that the mothers in Gallagher are younger than those in Ward. It is taken for granted that a woman should have a child every year.

There is a direct connection between undernourishment, low wages, irregular work and indecent living conditions. The incidence of typhoid and dysentery is far beyond the statistics of any civilized community, because of the pollution of water supplied by the coal companies. The water supply in Gallagher comes from a source immediately adjacent to outhouses used by the miners.

When the miners are working, there is left a budget of 77 cents per person a week for food and clothing for the people of Ward, and 71 cents for those of Gallagher. From the miners' pay, which is in the form of scrip currency redeemable only at the company stores, there is checked by the operators

\$2 a month for the pay of company doctors (who, by the way, are shunned by the coal diggers in most instances); \$1.50 for hospital charges, \$1 for burial expenses, and a charge for powder, tools, and timber used in extracting coal. The average total left for miners, after a two weeks' shift, comes to less than \$25, from which the rent for living in company houses and the debt from dealing at company stores are subtracted, so that in many instances the unorganized miner finds that he is in debt to the company for from \$7 to \$17 as a result of his labor.

The miners in both towns have never been able to afford the luxuries of ice, proper screens, and other preventives against infection. As a result the resistance to infectious disease among the children is startlingly low, so that there is a mortality of one in every five children, and among those who survive preventable diseases are notably rife. An entire generation of the children of American citizens engaged in the production of a basic commodity for power-civilization is being reared among conditions which inevitably lead to feebleness, degeneration and crime.

The most direct way to help the striking miners in their struggle for decent conditions is by contributing funds through the Emergency Committee for Strikers' Relief at 112 East 19th Street, New York City. Make checks payable to the committee or to Forrest Bailey, Treasurer.

New York City, August 6

DR. RUTH FOX

The Disarmament Question

TO THE EDITOR OF THE NATION:

SIR: Last week 10,000 people packed Albert Hall and listened to eloquent speeches by Premier MacDonald, Lloyd George, Mr. Stanley Baldwin, and others in behalf of disarmament. The United States does not yet seem to be as thoroughly aroused as England on this commanding issue. In spite of President Hoover's moratorium proposal, the world situation is perilous and the trouble from which Europe is suffering will not be cured merely by financial settlement. The most important element in bringing about the confidence which breeds prosperity will be a drastic cut in armaments.

World conditions are changing with startling rapidity and world statesmanship has not kept pace with the movement. The United States has a great opportunity to help. In January, 1931, twenty-two European nations united in declaring that they were "resolutely determined to use the machinery of the League to prevent any resort to violence." This declaration should now be followed by a statement from President Hoover, before the opening of the Disarmament Conference next February to the effect that the forces of the United States will never be employed to interfere with the machinery of the League when that is used to prevent resort to violence. If any nation is fearful, that nation will feel less suspicious and vastly more secure if it has assurance that in case of any possible outbreak in defiance of the Paris Pact, America would give no credit to the aggressor, would refuse to sell her munitions, and if she remained hostile, would break off relationship with her. Such an assurance would profoundly affect the attitude of mind at the Disarmament Conference.

What would such a declaration cost us? Practically nothing; but our government, although aware of a keen desire for peace, has been silent and not said the necessary helpful word. America is not yet fully aroused to the frightful danger to civilization if the representatives of practically all the nations of the world assemble at Geneva next February and are not able to work together for reductions in all kinds of ships, munitions and forces, together with adequate budgetary limitation. Unless some such action is taken and unless the pledges of

1919 are redeemed, prosperity cannot return to a world that refuses to be sane, but instead is headed toward internal convulsions and catastrophe. The hour has struck for definite and far-reaching action. The Soviet government has a plan; whether bad or good, it is a definite plan. The western world has not evolved one. It is staggering on hardly knowing what it can do or ought to do, and is bound to fall unless it has a plan. No nation can do more than ours to help that plan evolve.

London, July 20

LUCIA AMES MEAD

Harlem Gets a New Jail

TO THE EDITOR OF THE NATION:

SIR: The pompous dedication on July 14 of the new Thirty-second Police Precinct on the main crosstown thoroughfare of colored Harlem, amid the crashing cymbals of the Police Brass Band, was a damning commentary upon the government of New York City under the present administration. Summoned by the blare of trumpets, thousands of Harlem's unemployed blocked the squalid street of the new jail, richly festooned at city expense for the Roman holiday. The city's chiefs and their entourages to the number of scores, in their limousines, combined to stop traffic, in order that the mayor and his minions down to the alderman and aspiring local candidates could all join in the spectacle. The dignitaries of the section joined with the celebrated functionaries in their raucous, megaphoned, radioed speeches to the assembled throngs, and dined sumptuously on the banquet viands—all at the expense of the city treasury. But to what purpose was all this celebration? Had it been in celebration of a new public school, library, hospital; had it signalized the cleaning up of this frightfully neglected section, with its disgraceful parkways and dirty streets, which constitute a menace to the health of its citizens and the city; had it been to open up a great employment program to give Harlem's impoverished and underprivileged workers a chance to earn a living, this lavish expenditure, while foolish, could have been understood. But this was not the occasion of the monster spectacle. It was to launch Tammany's campaign. How? By dedicating a jail!

We have recently sought in vain to bring to the attention of the city the dangerous health conditions in this great black community. The new jail itself with its greatly enlarged facilities tells the story of increased misery and crime in this congested region. The back yards of the dilapidated old-law flats and ancient private houses which surround the new bastille are piled high with reeking refuse. The courts, cellars, and areas of all Harlem are live plague spots overrun with rats and vermin—nauseating the lodgers until shades must be drawn to avoid the sight and windows must be closed during these sweltering summer dog days to exclude the smell. Two-thirds of the dumbwaiters in Harlem flats are out of commission. Garbage from the top to the bottom floor is thrown down the shaft as a necessity by the householders, making the entire shaft a disease- and germ-breeding tract and the bottom of the shaft a live bed of filth. The resulting swarms of vermin presage an early arrival of malaria, diphtheria, measles, and smallpox unless heroic preventive methods are speedily adopted. With every tenement and health ordinance violated with impunity, both by landlords and lodgers, Harlem naturally constitutes a health menace not only to itself but to the city.

Why does the city government not remove the causes of Harlem's crime record by giving thousands of its unemployed work in cleaning up the section? Instead, it dedicates a jail and squanders thousands in the dedication!

GEORGE W. HARRIS

Books

The Logic of the Rose

By LANCELOT DENT

Consider the sweet mystery of the rose,
How reasonably its petals presuppose
The limpid universals it selects,
Repelling all the others it rejects
So timelessly, till come untimely shears.
It is the perfect thing that it appears,
Yet holding undissolved for God to see
Its own precise particularity.

Change and Fixity in the Law

Law and the Modern Mind. By Jerome Frank. Brentano's.
\$4.

DISCUSSION of our political life cannot have much reality while we talk of democracy and the will of the people, and our actual government remains an irresponsible judicial aristocracy. A small number of judges can, under the guise of interpreting the law, settle for a long time any vital issue in accordance with their own class bias or antiquated opinion as to social and economic needs. In the progressive *ante bellum* days, proposals were discussed for the recall of judicial decisions and for other ways of making the law more responsive to the present-day interests of the majority of the people. But the leaders of the American Bar, either because they feared the removal of issues from the field of their professional power to the political forum where the wishes of *hoi polloi* might count, or else because they really did not know any better, began a campaign of "education" and "sold" to the public the idea that the courts have nothing to do with making and changing the law. This theory of a complete Law that speaks into the mind of the judge, who like a phonograph does nothing but repeat it, had frequently been shown by intelligent jurists since the days of Austin to be a fiction. But the prestige of the leaders of our bar, the desertion of the progressive cause by Roosevelt, and the general shadow of the oncoming War made this fiction prevail, and it still holds the fort as our orthodox national myth.

Mr. Frank's book is, therefore, of importance as a valiant attack on the orthodox position, by a keen lawyer who knows the ropes and brings to his aid an unusually varied learning, including the fashionable form of psychoanalysis.

Having in my own way for over eighteen years fought against this citadel of legal unreason, my inclinations are naturally to hail Mr. Frank as an ally in a righteous cause. Also because Mr. Frank is a highly esteemed friend, it would be pleasant to dwell on the great merits of this book and its timeliness. But others have already done so, and the public has so approved its readable quality as to put it already into a second printing. It seems to me, therefore, more useful to point out why, though the author's heart is in the right place and his courage most admirable, he is not likely to disturb the enemy very seriously. The book is not well organized, the shots are often carelessly fired and wide of the mark, many of the shells are duds and some may act like boomerangs. This friendly criticism of an ally is all the more necessary because these defects are characteristic of our young liberals who, though they talk much about science and the methods of science, woefully neglect the art of close reasoning and seldom trouble

to produce logically conclusive evidence for their contentions.

Mr. Frank's book is not well organized. The various chapters are rather loosely strung together, and the subject matter is distributed without any careful plan among them, as well as among sixty-two pages of miscellaneous appendices, and thirty pages more of notes in addition to footnotes. Mr. Frank confuses his references, fails to do justice to the authorities he quotes, and in moments of illumination makes wise qualifications in footnotes which he subsequently ignores in the text. These are in themselves minor matters. Mr. Frank is a busy lawyer, and we should be grateful for the labor, often useful and illuminating, which he has from time to time devoted to this book. But unfortunately the outer lack of order is correlated with a failure to think through what he ultimately wants to say.

His central aim is to deny the complete certainty of the law. Does Mr. Frank, however, wish to rush to the other extreme and, substituting one childish simplicity for another, maintain that there is no certainty in the law at all? Here we have a regrettable lack of clarity. An affirmative answer to the last question is logically involved in his extreme nominalism or denial of rules, which he develops in his unfortunate polemics against Pound, Jhering and Dickinson (e. g. pp. 156, 217). Thus he quotes with approval Dean Green's categorical assertion that "the control of judges is not to be found in rules," (p. 283)—a recklessly anarchic statement which ignores the daily experienced necessity for rules as checks not only on judges but on the ignorance and bias of all private as well as public agents. It ignores also the ever pressing need of uniformity in various phases of modern life.

Mr. Frank, however, has no clear idea as to what he is thus committing himself to; and elsewhere, especially in footnotes, he explicitly recognizes the existence and need of some rules and certainty in the law. This admission, however, still leaves his fundamental thesis rather vague and inconsequential, and his polemics pointless if not unfair. For obviously, if the law contains both rules and discretion, both certainty and uncertainty, the significant issue is precisely the one that Dean Pound faces and that Mr. Frank dodges, viz., where to draw the line between legal rule and judicial discretion. Without such a line there cannot be much definite meaning in Mr. Frank's contention that he is arguing only against the conventional *exaggeration* of the importance of rule and certainty. We cannot tell that any one has exaggerated unless we have measured or at least estimated the *correct* amount. But such a task seems so uncongenial to Mr. Frank that he is most unfair in his attack on Pound's effort in that direction. To grant that Pound has not adequately solved that most difficult problem would not justify Mr. Frank's argument here. The latter, if generalized, would deny the distinction between day and night, by asking where in the twilight zone we are to draw the line where one ends and the other begins. No one can well deny Pound's contention that the field of property and contract is full of exact rules, such as the legal rate of interest, the age of contractual responsibility, the number of witnesses necessary for a will, and thousands of similar rules.

Again, Mr. Frank has not faced clearly the essential question as to whether the central phenomenon which he is examining, viz., the craving for certainty, is found only in the law or whether it exists also in other fields, e. g., in medicine. He begins his book as if he were dealing with something peculiar to the law, something that explains the anomalous position of the lawyer in the community. His explanation, however, is in terms of a supposed general fact of human nature—the reliance of the child on the authority of the father. This is certainly contrary to all canons of scientific procedure. For if the cause is general, it ought to manifest itself in all fields of human life,

and if the effect is special to the law, there must be special causes that Mr. Frank has not faced.

There can be no doubt that the desire for complete certainty—the craving for absolute truth—is a trait of all creatures born of woman. Does not Mr. Frank himself believe that his formula, that the law is a *growing* or changing affair, is the real or absolute truth? Or does he expect that tomorrow it *may* be proved once for all that the law is a fixed and eternally unchanging system? Mr. Frank does not really face the theoretical and practical conditions of this craving for, and assumption of, absolute knowledge, because of his preoccupation with his pet theory that in the legal field this craving is due to a transference of father-authority to the Law personified. This theory is neither plausible in itself nor is there anything like scientific evidence offered for its adequacy. In every community there are a number of people who for some reason or other have never had a chance to rely on paternal authority. Is there any evidence that they demand less certainty of the law than do the others? Again, when youth ceases to respect paternal authority and relegates it to the realm of Victorianism or old-fogeyism, *does* it transfer its old awe to the law? Or is not the law also apt to be viewed as absurd by rebellious youth? And if men begin to rely more on routine as they grow older and have less zest for adventure, why drag in the notion of a father-substitute?

Mr. Frank protests—perhaps too much—that his psychoanalytic explanation is only a partial one, and at times he calls it a fiction. It is hard in view of the confidence he shows in this explanation to make out exactly what he means by its partiality or its fictional character. His complacent assumption that psychoanalytic concepts like father-substitution are “the best instruments now available for the study of human nature,” begs more than he or any one else has as yet proved. Psychoanalysis has doubtless led to some therapeutic results. But so have Christian Science and other faith-cures, and a logician must contend that therapeutic efficiency does not prove the truth of all the different faiths that produce it. Psychoanalysis will become scientific only when, like biology, it becomes really critical of its own evidence, instead of resenting—as all sectarian faiths do—the demand for such evidence. In any case a little more scientific modesty as to the adequacy of his psychology would have saved Mr. Frank from the ridiculous procedure of trying to dispose of Jhering's effort to determine the certain element in the law by calling it “childish.” Mr. Frank's categorical denial of the postulate of “a universe completely governed by discoverable unchanging law,” involves an absolute knowledge for all future time. Would it be fair to call *him* childish for that? Despite the fashionable modernistic logicians whom Mr. Frank follows too blindly, the attempt to refute a man's views by inventing pejorative psychogenetic accounts of them remains the fallacy recognized and named by the old textbooks. It is especially bad grace to apply a quasi-abusive epithet like “childish” to Jhering, who in his famous essay *Im Begriffshimmel* has anticipated all that is sound in Mr. Frank's arguments against undue certainty in the law. Jhering, however, was too sound a jurist to forget that the real problem is to find the precise relation between the certain and the uncertain elements in the law.

It may perhaps be unfair to judge Mr. Frank's book by a standard of logical rigor not generally applied to books written for the general public. But as Mr. Frank is engaged in a serious and important task, it must in the interest of the latter be pointed out that the myth of a completely certain legal system, apart from the work of judges—a myth which has its roots in legal experience from time immemorial—cannot be overthrown by an admitted fiction from the mushroom science of psychoanalysis. The myth is in fact, like other persistent human beliefs, a half-truth, and its error cannot be overthrown

unless we recognize the part of it which is based on the impregnable rock of logical truth.

In the interest of general sanity, which liberals ought not to ignore, we should note that the desire for undue simplicity is not restricted to Platonists and scholastics (epithets never used in a derogative sense except by those who are woefully ignorant of the writings of Plato and of Thomas Aquinas). It characterizes all those who glibly assume that a world of change must exclude all constancy, and that the reality of particulars is inconsistent with the reality of universals. In this respect Mr. Frank, like others, has been misled by the theologico-philosophic vagaries of Eddington as to the meaning of Heisenberg's principle of indeterminacy. The latter principle is an empirical application to the electron of old truths as to the nature of measurement. But neither Heisenberg's principle nor the statistical view of nature can deny that different things have universal or common natures (that things come in *kinds*) and that science is a search for constant laws governing the changes of things.

If the natural human craving for certainty be childish, the complete denial of it would be complete madness. If I actually doubt that stones will continue to lie on the ground if undisturbed, that my body is material and that my fellow beings continue to exist, the latter will for their and my protection have to lock me up in some asylum. Mr. Frank is impressed with some of the harm of the pretended certainty of the law. He should reflect that modern life would be completely paralyzed without the constant effort to make the law more certain, so that people can know on what to rely in their enterprise. Uncontrolled discretion of judges would make modern complex life unbearable. Rightly does Mr. Frank hold up Justice Holmes as a mature mind on the bench. But that great jurist not only believes that there is certainty in the law but that it can and ought to be increased. At any rate his greatness as a judge is precisely in the preeminent way in which he distinguishes between the legal rule which limits the scope of his function and his own personal opinions.

MORRIS R. COHEN

The Sins of a Critic

Two Symphonies. By André Gide. Translated from the French by Dorothy Bussy. Alfred A. Knopf. \$2.50.

HIS enemies find in Gide the hypocrite; his friends the moralist. Many of those who know his work in the original believe that his criticism, only one volume of which has been translated, is more important than his fiction. His admirers—and I may say that I am among them—think his spirit has ranged further and stayed younger than that of any other living literary critic, that his criticism can be depended upon to seek out that which is essential and most deeply human, that his “classicism” is one of the most creative forces of our time. Above all, his admirers feel that his peculiar distinction lies in his way of emphasizing the *moral* content of literature, which comes from his well-known fascination with the problem of good and, especially, evil.

This volume is his eighth to be translated. Perhaps some general reflections on his work are now in order. Here are two *récits*, “Isabelle” (1911) and “The Pastoral Symphony” (1919). Both are written with the consummate finish and ingenuity that we expect of anything by Gide. And yet they are almost certain to prove a disappointment—perhaps a revelation—to his American reader. For however well-written, these are not living stories but fleshless, implausible specters of stories. Each is told in the first person and ends in the narrator's self-castigation. In “Isabelle” he is a romantic young writer and

condemns himself for falling in love with a name. In "The Pastoral Symphony" he is a Protestant pastor and condemns himself, among other things, for frustrating the young love of his son and his blind ward, for his arid heart, and even for his care-worn face. Each story ends upon a note of didacticism—as a last resort: to redeem it, to pull it together, to give it an individual tone. For similar reasons a few stray ends are deliberately left untied. The result is that everything is enveloped in a cloud of false mystery.

Both stories are heavy with the author's guilt. And no wonder. For in pinning together these skeletons Gide has committed sins that as a critic he would be the first to decry. Each is founded, not upon a real experience of life, but upon an all too "literary" idea. Each addresses itself almost solely to the intelligence. The characters in each are seldom more than reconciliations of the demands of plot and the demands of consistency. In every note of these unmusical "symphonies" we hear the overtone of self-consciousness. The author seems to glance over his shoulder as he clears the first hurdles of motivation, plausibility, coincidence, characterization; there is a worried look on his face. The hurdles ahead are higher and he begins knocking them down. Then, as though he were Zeus, he causes himself to be concealed in a cloud, and we cannot make out what he is doing. The mystery, we know, is false, but it is very thick. And when he appears in the open once more, at the finish, wearing a strained smile, we have no way of telling whether he ran around the remaining hurdles or climbed under them.

Some people wonder impiously why Gide writes fiction at all. They say that every page is tainted; and they are right. But they overlook that in addition to being a hypocrite, he is also a moralist. How could he be a moralist if he knew nothing about the function of evil? (For it is the function of evil that he understands, not evil itself. That is why he is equipped to be a critic, but not a novelist. That is why he is so good when he discusses the role that evil plays in Dostoevski's work, for example, while his own "Immoralist" is merely a studio sinner.) After all, he must have some experience of evil, if only a literary one. We are driven to the conclusion that the sins of this great critic are his "creations."

GERALD SYKES

Socialism, Red or White

Bolshevism at a Deadlock. By Karl Kautsky. Rand School Press. \$1.75.

THE present writer approaches this volume in no little pain of spirit. Karl Kautsky was one of the teachers of his youth. "The Social Revolution and After" appealed to him as the very perfection of sound thinking in the economic field. But now, twenty-eight years later, old friends are parted, old gods are overthrown, and lie with their faces in the dust.

It would be interesting to take Kautsky's old-time prophecies of the social revolution, and compare them passage by passage with his repudiation of Bolshevism. It would be interesting as a psychological study of the effect of age upon the human mind. It would be interesting as a historical study, to trace the process whereby a leader of revolutionary theory has been brought into what seems, to at least one of his pupils, a completely counter-revolutionary attitude.

It was in 1906 or 1907 that I had with Kautsky a correspondence on the subject of my pamphlet, "War, a Manifesto Against It." I wanted all the Socialist parties of the world to form themselves into an international legislature to abolish war and pledge themselves to revolt against it. Kautsky said

it could not be done—at least not by the Germans—their party would be wiped out by the government. Kautsky wrote me that he wanted an unsuccessful war for Germany. But seven years later, when the war came, Kautsky changed his mind, and decided that he wanted a successful war for Germany. When the Russian Bolsheviks hindered his new desire, he turned upon them in a rage, and now finds no language too strong to denounce them and all their works.

Soviet Russia is a fact of colossal significance and of colossal size. There are an infinite number of details to be observed, and without the slightest difficulty, one can select a particular set of details, and prove that Soviet Russia is anything one pleases. The Bolsheviks have obligingly provided Comrade Kautsky with sufficient unfavorable data to fill an encyclopedia. They practice what they call "self-criticism," washing all their dirty industrial and financial linen in public. Comrade Kautsky selects a few of the latest items, and by them proves exactly what he wants to prove.

He is sufficiently naive, or sufficiently considerate of the reader, to explain the principle upon which he has selected his facts. He knows *a priori* that there can be nothing good in this revolution, because it did not come according to the Marx-Kautsky formula. It ought to have come in a highly industrialized country like England or Germany; instead of which, it came in a primitive and backward country, and so it is "fantastic" and "impossible." Says Kautsky: "If Lenin is right, then my whole life's work devoted to the propagation, application and further development of the ideas of my great masters, Marx and Engels, has been in vain." And of course that cannot be.

In the same way Comrade Kautsky disposes of Russian "dumping" in one conclusive theoretical sentence: "This surplus has certainly not been as large as that promised in the Plan, for that is impossible." In this spirit he goes on to wave out of existence one department after another of the Russian endeavor. For example, he tells us that in Russia "The masses are perishing of famine and squalor." His book was published in Germany in the fall of 1930, but a preface to the English and American editions brings it up to January of the present year, and shows that Comrade Kautsky chose to pay no attention to the enormous harvest of the first year of collectivization.

And now the still greater harvest of the second year is rolling in, and the statement sounds even more absurd. Kautsky says: "In no circumstances will Soviet Russia be able to create agricultural large-scale production capable of survival. The attempt to conjure up thousands of big holdings overnight has merely resulted, and will continue to result, in the destruction of the soundest and most productive section of the peasant population." The answer to which is some thirteen million peasant households now in collectives, and a planted acreage ten per cent higher than last year.

One can go through this book, and take statement after statement which is thus contradicted by the impolite facts. One could have laugh after laugh over sentences in which an elderly German theorist—described on the jacket of his book as "the Foremost Marxian Theoretician of our Times"—waves out of existence by a formula the most colossal and significant developments of the modern world. Thus, for example: "What is the essence of the Five-Year Plan? Nothing but upsetting the balance between the various branches of production." This at a time when the triumph of the Five-Year Plan, in maintaining the balance between the various branches of production, has become the sensation of the capitalistic world!

There are two attitudes towards Soviet Russia struggling for prevalence in the Socialist movement. It is hard for thinkers who have based their movement upon democracy and liberty, not to be repelled by the idea of dictatorship. On the other hand, if one has to choose between permanent economic

serfdom, and the temporary loss of the right to disobey orders, many Socialists, especially the younger ones in the movement, will choose the Soviet system as a lesser of two evils. But whatever the Socialists decide, they must bring themselves to face the facts; they must not lose themselves in a self-emitted fog, along with "the Foremost Marxian Theoretician of our Times."

UPTON SINCLAIR

World Cooperation

The Background of International Relations. By Charles Hodges. John Wiley and Sons. \$5.

PROFESSOR HODGES differs from most writers on international relations in that he does not confine himself to any particular aspect of the subject, but ranges comprehensively over the whole field. An understanding of international relations, he points out, involves a kind of panoramic view of geography and sociology as well as of economics, history, and political science, since international events "are always compounds of these underlying elements." Such non-political elements, accordingly, as physiography, race, population, economic organization, means of communication, and the collection and dissemination of world news play a large part in his exposition. The net effect of this portion of the "background" is to emphasize not only the variety of interests with which international relations are concerned, but the inherence of such relations in the natural development of society. To these non-political elements politics adds powerful factors of its own. Diplomacy, in undertaking to regulate the relations between states, has developed a system of international intercourse which looks in the direction of world organization. The gains in that direction in the nineteenth century were not sufficient to withstand the crisis of 1914, and Professor Hodges sees the World War forcing the nations to "seek closer cooperation for the preservation of world unity."

The "driving force" in national politics today, however, is business, and while "economic hunger" impels nations to "seek commercial supremacy backed by the power of the state," Professor Hodges thinks that "enlightened self-interest is enforcing world cooperation in both political and non-political ways." His exposition, on the other hand, suggests a cooperation such as subsists in movement on parallel lines. A Great Power, he says, "must not only possess the old requisites of sufficient territory and population to bulk large in international relations," but "there must also be added at the very start a high-powered business system." As a consequence we "have to keep two kinds of worlds before us—the political and the economic," and of the two the economic seems to be the greater. International business exercises "a far-reaching economic 'right of eminent domain' in dealing with world affairs. It moves across political frontiers virtually at will. . . . For practical purposes, the business of these Great Powers has taken on itself the mandate for the control of economically less efficient peoples."

Professor Hodges's obvious sympathy with internationalism does not blind him to the virtues of historical nationalism and its great and continuing influence in the world. A careful weighing of the pros and cons leads him to the conclusion that "no one can doubt the power of nationalism for the next century or two as the outstanding political factor in international relations. At once it is a mobilizer of men's differences and of their loyalties. Perhaps in this age of the 'uprooted man' nationalism is the one conserving political force that holds him in allegiance. . . . While its manifestations arouse mixed feeling, the thing itself is solidly entrenched in our world."

On the more familiar phases of his subject, such as the League of Nations and the International Labor Office, the

World Court and arbitration tribunals, international organizations and conferences, and the anti-war movement, Professor Hodges offers judicious comment and a wealth of data. The chapter devoted to the press is especially informing, and there is an excellent description of the actual work of the League. As far as information and substantive scope go the book is a veritable encyclopedia, and the numerous pictures, graphs, and statistical tables are an admirable supplement to the text. The attempt to expound so vast a subject on lines of general principles, together with the philosophical tone of much of the exposition, makes parts of the book hard reading, but the reader who will persevere to the end of the 678 pages will be rewarded with an all-round view of international relations not to be had from any other single work.

WILLIAM MACDONALD

Mercutio in Mayfair

Ronald Firbank. A Memoir by Ifan Kyrle Fletcher. With Reminiscences by Lord Berners, Osbert Sitwell, Augustus John, and Others. London: Duckworth. 8 s. 6 d.

ONE could wish that all memoirs of unusual people were written in the vein of this one, for it is not a conventional or a sentimental estimate, but a courageous attempt to capture, without apology, the unbelievably rare and defiant soul of Ronald Firbank, which, at Rome in 1926, unexpectedly, and as if perversely, as if suddenly deciding to take a train to Memphis, fled to its appointed sphere.

Our only criticism of this rather enticing book is that, inevitably perhaps, it lacks the gossamer humor befitting any treatment of its utterly fantastic subject. We think that Firbank's art deserves to be taken with the utmost seriousness, but the facts of his strange life merit a slightly different treatment. Mr. Fletcher, however, writes unpretentiously, and thus well. Of the other sketches, the one by Lord Berners is the best in the sense of slightly resembling the manner of the original. The one by Mr. V. B. Holland, an athletic acquaintance from Cambridge, is also extremely sympathetic. It was Lord Berners who executed the funeral arrangements at Rome, and "never dreaming" that Firbank was a Roman Catholic, had the writer buried in the Protestant cemetery, not far from Shelley. "The nightingales who attended the funeral," he writes, "were presumably Papist, for they did their utmost to drown the voice of the officiating chaplain."

When one asks what manner of man was this who could summon so remarkable a tribute, one is inclined to query whether he was a man at all. There are moments in "Prancing Nigger" and in the posthumous book which suggest the idea that if Puck or Ariel had been dressed up and sent down from Cambridge he would have written much the same sort of prose. Firbank actually makes one speculate on those fairy changelings, devoutly credited by the demon-haunted fancy of the Middle Ages. His peculiar talent as a writer calls up the vista of a mixed spiritual paternity, composed of Gautier, Beckford, Lord Herbert of Chisbury, P. J. Toulet, Crébillon fils, and Aubrey Beardsley. But not at all: in cold reality, Ronald was the son of Sir Thomas Firbank, M. P., a railroad magnate, and grandson of Joseph Firbank, known as "Faither" Firbank, a day laborer. Of these progenitors, the workman seems to have been the more interesting. One wonders what he would have thought of the creator of Cardinal Pirelli and Mrs. Mouth, whose first book was entitled "The Mauve Tower."

At Cambridge Ronald refused to know anyone, and spent most of his time, writes a contemporary, "in writhing about and admiring his hands," heavily studded with jade and sandstone

rings. Almost his only close friend was Monsignor Barnes, Roman Catholic chaplain to the university. Not long afterward Firbank was definitely received into the Church of Rome, but he never seems to have practiced his religion, and his last act was the almost unprintable "Cardinal Pirelli" volume. Something must have happened, some unfortunate but inevitable "hitch." Firbank, one sees clearly, was, in the moral sense, one of the most honest of men. He would not eat his cake and have it too. But all Firbank ever reported of this case of conscience, which many converts manage to evade quite nicely, was when he said once to Lord Berners: "The Roman church wouldn't really have me, so I just laugh at her." He has been called a mere post-war Beardsley by those who do not appreciate him, but he was very unlike that artist. "Burn . . . for God's sake . . . all dirty drawings and papers," said Beardsley in his death sweat to a confessor. Somehow one cannot imagine Firbank giving anyone this direction.

If one judged Firbank without reference to the achievement of his twelve books, one might superficially put him down as one of the most insufferable sublunar creatures who ever wore trousers. He seemed to parade in his person and speech all the most inhuman affectations of a tiresome era. One evening in 1914 Rupert Brooke's biographer went out between the acts of the Russian ballet at Drury Lane and "noticed a strange figure pirouetting about in the corridor and making faces to itself. . . . Everyone stared, when suddenly the figure darted up to me, took my right hand out of my trouser pocket and shook it warmly, saying: 'I'm going to Kamschatka! Do you think I'm wise?'" To the superficial observer, we repeat, Firbank's existence, apart from his books, seems to consist of all the tedious preoccupations pursued by aesthetes the world over, whether in 1890 or 1931—big rings, Egyptian tombs, Egyptian cults, champagne, orchids, sight-seeing, the Russian ballet, first editions, reveling with young pimps in Paris, so near for your bold, bad Englishman, and, in every sense, so cheap. "My dear, I saw a crossing sweeper in Sloane Street today with the eyes of a startled faun! . . . My dear, when you talk like that you give me a distinct feeling of plush . . ." And so on. Lord Berners reports an absurd incident at the ballet when Firbank and a well-known female fantast, Lady X, both loudly complained that the one had "leered" at the other. But it must be obvious that the two stories we have told of Firbank could never have been told of any mere relic of the nineties, any disciple of the late Oscar Wilde. The latter and his friends, being, for the most part, men without real literary talent, were chronically afraid of making fools of themselves in the only world they really understood—that of society. They wanted to lead the fashion, not to defy it. Firbank, on the contrary, behaved, throughout his life, be it to fly, swim, dive into the fire, ride on the curled clouds, with the radiant unconscious humility of a St. Francis, recking nought of the conventions of a Nordic country. It was not so much that he defied certain social and moral conventions; it was as if he had never heard of them.

Firbank, as Mr. Sitwell somewhere says, was in the best and truest sense one of the war novelists. When 1914 came, he retired to Oxford, almost the one place in England left spiritually unshattered, and there he really began to write. Before the war Ariel had continuously eluded Caliban through all the well-worn avenues of dilettantism. Thenceforward the escape from life was opened up through his own books. Naturally they are very uneven, and the earlier ones seem a little derivative and unsure. But in the last two, "Prancing Nigger," with its dusky girls and boys, so different from those of Mr. Van Vechten, and the Andalusian volume, about the odd doings of a Cardinal, Firbank was superlatively himself, and no one has resembled him.

There are certain good reasons why these novels will never be much read. In the first place they seem dreadfully out of

place in a post-war literary world which may be summed up, in the words of one of our most popular poets, as one of "smoke and steel." The athletic Mr. Holland has perhaps described them as well as anyone—"books written in that nebulous state while the dream still holds its spell, and its improbability and absurdity are not yet apparent." Of course there is a market for this sort of thing on the express condition that it be Cabelian, that is to say, manufactured, meretricious, and unutterably whimsical. The great point about Firbank is that he was never "whimsical." In his strange, unearthly, un-English way, he was profoundly humorous. There are touches of true Rabelaisian gusto in his last and best book which could be quoted, though to quote them is to divest them of much of their quality, like humming a few phrases from a sonata.

"Misericordia!" Monsignor Silex exclaimed, staring aghast at the dog's leg poised, inconsequentially, against the mural tablet of the widowed Duchess of Charona—a woman who, in her lifetime, had given thirty million pesos to the poor!

They were ringing "Paula," a bell which, tradition said, had fused into its metal one of the thirty pieces of silver received by the Iscariot for the betrayal of Christ.

"They seem to have asked small fees in those days," she reflected, continuing her work.

"A symbolical attitude perhaps," writes Lord Berners of his friend. "Many passages in his books seem as if written with his back turned [as, indeed, was his nervous habit while conversing] looking out of the window." And through that window of his unique mind there is no doubt that he saw some very curious things.

CUTHBERT WRIGHT

Beyond the Wasteland

Harmonium. By Wallace Stevens. Alfred A. Knopf. \$2.50.

MR. ELIOT merely defined the territory of the Wasteland and of its emotional ennui in a few stark details. Then he escaped from it into scholarship, into religion, leaving other poets to explore. Ivor Winters pushed its boundaries still further into hopelessness by pointing out that the passion of scholarship was in itself sterile, that man crumbled not only within his environment, but within the brain itself. Archibald MacLeish returned in desperation to the desert, naming it, whatever else it might be, the necessary "New Found Land," and better than exile from home. But none of these poets faced the problem which was Wallace Stevens's: here was a poet of the senses, a poet desirous of moonlight as any Keats, a poet aware of and sensitive to every subtle sensuous delight—what was he to do in death valley? Stevens's answer to this question is the very extreme of the Wasteland theory. His is the final word.

In the deliberate deflation of the emotions he has exceeded any of these others, for he has chosen to explore every mood, with full realization of its several anti-moods; he has chosen to build up the vision, only to prick it. He points out that the disassociation of the emotions lies not between one point in time or space and another point in time or space, but within the very inception of the emotion itself. No feeling is more than acknowledged before it splays out into a dozen different and antithetical feelings. No intensity mounts to its climax without the insidious question at its center.

Stevens will allow himself no protection: he will not cry out in bitterness, he will not deny one detail of multiform beauty, he will not play the "flat historic scale of memory," nor take momentary delight in "doleful heroics." He knows that love is a book too mad to read "before one merely reads to pass the time" and yet he reads it aloud. All is fantasy: the

book of moonlight never has been written, and the protagonist, Crispin, is merely a fagot in the lunar fire whose heat comes only from the fables he, himself, scrawls. Stevens persists in being a poet of moonlight who in the end pricks the bubble of the moon itself.

For all these reasons, Wallace Stevens has been called a "Dandy." The word is unfortunate in its implications of superficiality, posturing, and super-refinement. Stevens's highly mannered, technically superb verse is so written because it best expresses his particular creative imagination: to this mind no simple statement is possible, every word has innumerable associations. This poet is sincere in being insincere, since to be sincere would for him be ridiculous. His sincerity lies in his attitude. Moreover if Stevens is over-refined, it is only because we still measure refinement by the normal bluntness preserving the ordinary man for his mechanical world—not by the truer instrument of the sensitive imagination. Refinement is all we have today of exuberance and vitality. It is no mere pose when for Stevens God is where,

Above the forest of the parakeets,
A Parakeet of parakeets prevails
A pip of life amid a mort of tails,

no mere pose that woman worship, is for this poet merely an emanation from sensuous delight in "heavenly Vincentine."

Stevens having been driven by the afflatus of other poets into wandering away from such counterfeit, tells us that poetry is the "supreme fiction," that

He gripped more closely the essential prose
As being, in ■ world so falsified,
The one integrity for him, the one
Discovery still possible to make,
To which all poems were incident, unless
That prose should wear ■ poem's guise at last.

This is ■ new edition of "Harmonium." It is interesting to note that since 1923 the poet has repudiated only two poems, the Silver Plough Boy, a meaningless pretty imagistic verse, and Architecture, a poem in which the manner exceeded in difficulty the subject. He has included fourteen new poems amplifying the theme of the Crispin poems, grown slightly more autumnal:

One might in turn become less diffident,
Out of such mildew plucking neater mould
And spouting new orations of the cold.
One might, One might. But time will not relent.

EDA LOU WALTON

Popularizing Christian History

Since Calvary. By Lewis Browne. The Macmillan Company. \$3.50.

THE subtitle of this work is "An Interpretation of Christian History." Since Mr. Browne can scarcely pretend to be offering anything like ■ new point of view, "interpretation" means, as it generally does, ■ license against thoroughness and precision, a half-apology for wandering rather aimlessly over two thousand years. Mr. Browne could hardly call ■ History this potpourri of rewriting from the best secondary and tertiary sources. What standards can he possibly claim to have employed in dividing his 428 pages among the centuries? One hundred and sixteen pages go to the first three centuries, 60 to the next five, and the period since 1648 is disposed of in 80 pages. And they are pages filled with ■ repetitious style which relieves Mr. Browne of having to say very much. This is even less the history of Christianity than Durant's was the history of philosophy.

A book like this serves, however, one useful function. The

secret of a popular writer is, of course, that he has the same mentality as his readers. Consequently, "Since Calvary" is probably a good index to the notions about the history of Christianity which prevail among the six million persons who read non-fiction books in this country. How much of the last century of scholarship in the field has seeped through to this larger public, has become so commonplace as to be acceptable to large numbers despite their early religious training and their vested emotional interests? It is a safe guess that what Mr. Browne knows his readers also know or are at least ready to receive.

For one thing, there is a growing recognition of the minor role played by Jesus and Paul in the foundation and formulation of Christianity. Since writing "Stranger Than Fiction" Mr. Browne himself has learned that no one really knows what Jesus taught, that he is more the creation than the creator of Christianity, and that the "Pauline" theology is, rather, Hellenistic. The pagan character of emergent Christianity, a truism for thought since the French enlightenment, is also by now obvious enough to merit extended comment from Mr. Browne. So also with Constantine's highly political reasons for accepting Christianity, and the church's function thereafter in keeping the state's subjects subservient.

The growing polytheism of the church, its degeneration into ■ political institution controlling vast wealth ground out of the miserable peasantry and contested for by a horde of unscrupulous bandit-ecclesiastics, the decline of the monastic attempt at purifying the Christian life into simply another form of domination and oppression—these things are quite familiar to many, for Protestantism has been able to make capital for itself out of them. Much more reluctant has been the acceptance of the socio-economic reasons for the Reformation. Even the religious liberals who "humanize" Christ and accept the Bible solely as poetry dislike to think of the Reformation as it really was: of the rebellious hatred of the lower classes for church and state, and the cupidity of king and noble desirous of church wealth, aggrandized by the efforts of the middle class to break feudalism and make way for the era of laissez-faire. But though it is not a pretty one, the true picture of the Reformation is fast becoming widespread.

Most significant of all, Mr. Browne's book adumbrates, though timidly, an anti-clericalism and a conviction that Christianity is dying; and here, too, he probably reflects the hesitant and still uncrystallized sentiment of a large public. For the acceptance of the history of ■ religion without its pious whitewash is always preceded by religious indifference or hostility. If the harsh truths about Christianity were as firmly established as the day of the month, men still would not believe them so long as the church held their loyalty.

FELIX MORROW

Fiction Briefs

Brothers in the West. By Robert Raynolds. Harper and Brothers. \$2.50.

The Harper prize winner for this year strikes a new note which is yet strangely reminiscent of some period in the past. One goes all the way back to eighteenth century sentimentalism and budding romanticism, however, before one finds the period. Henry Mackenzie, that "Man of Feeling," would have liked this book with its tears and exposure of sensibilities, although dealing with strong men in a savage country. Mr. Raynolds's dying elk is brother under his skin to Lawrence Sterne's dead ass. And the cadaverous figure of the unhappy Donald somehow calls to mind the Old Man of the Hill out of "Tom Jones"—for even Fielding sometimes slipped into that fashion

so adored by eighteenth century ladies of feeling. But Mr. Raynolds adds thereto a note of mysticism. These two great brawny brothers of his, rovers, miners, trappers, ranchers in turn, are always talking about "the place where we were born," a holy land, a mirage, which they find only in death. But in spite of these overtones and the bathos of the last chapters, there are some finely written passages, some excellent story telling, and a few well drawn characters in a book which, for the most part, holds the interest. It marks a complete break from the various kinds of contemporary realism. Conversations are not recorded after the manner of actual speech but are translated for us into more pure and subtle language. Details are spared us in favor of an atmosphere of vague and symbolic remoteness. The volume, appearing at the present moment when most serious novelists are seeking new ways of approaching the age-old problems, is an interesting experiment.

The Garden. By L. A. G. Strong. Alfred A. Knopf. \$2.50.

In writing about Dermot Gray, Mr. Strong seems substantially to be writing about his own boyhood. His novel is a sentimental revisit to the Dublin coast where this son of an English father spent his summer vacations with the relatives of his Irish mother. Some boyish adventures are recounted, but the book consists mostly of affectionate portraits of old friends. It should serve to augment the growing popularity of Mr. Strong, for it is well written in the manner that we have come to expect of a certain number of English novels each season. But above all it is well mannered. When Mr. Strong is writing a scene he makes no attempt to create it; but he can be depended upon to talk about it in a way that would be entirely charming and suitable from the lips of any gentleman. His good humor never leaves him, nor his polite inflection. And Dermot is so unadventurous and proper that he is almost an ideal hero for modern England. In the Epilogue he and some of his friends are shown to have died in the War. But this was no doubt needed for "artistic" reasons.

Seven Days. By Andreas Latzko. Translated by Eric Sutton. The Viking Press. \$2.50.

This novel is an odd mixture of a melodrama and a plea for social justice. A young workingman named Abt, who feels that he and his family have been wronged by a wealthy baron, succeeds in trapping his enemy in an affair with a friend's wife. By threatening to expose him, Abt forces the Baron to change places with him for a period of three days, that the latter may experience the daily life of a laborer. The experiment results in the violent death of Abt. But the Baron meets an idealistic doctor, a well-known social worker who had befriended the dead man, and becomes converted to the socialistic beliefs which the doctor expounds. Some of the discussions and arguments are well thought out and constitute a powerful appeal for social change. But the story is quite unconvincing; and the characterizations are without distinction.

Simpson: A Life. By Edward Sackville-West. Alfred A. Knopf. \$3.

Simpson is a middle-class Englishwoman who refuses to marry and have children of her own, but spends her life nursing the children of others. This essential point of character is made clear at the outset; the rest of the novel is a simple account of the homes she enters and the children who call her "Nanny." After a certain length of time with a family, when the child begins to grow up, she insists upon making a change. She does not save her money. In the end she is killed in a post-war riot in Germany. Mr. Sackville-West has written about her and the inhabitants of her "temple"—that is, her children—with the utmost care and sympathy. His style is fluent. His understanding of people is good, if somewhat

Q. E. D. The worst that can be said of his book is that it lacks necessity, and therefore direction, and therefore vitality. This is a shame, for into it have gone talent, rare self-effacement, and fine sensitivity.

Renée la Vagabonde. By Colette. Translated by Charlotte Remfry-Kidd. Doubleday, Doran and Company. \$2.50.

A sentimental love story, with the usual devices of resistance, capitulation, and renunciation, is told in a stilted translation of what must be an earlier, perhaps autobiographical, novel of Colette's. The heroine, Renée, is a dancer who was once the wife of an unfaithful, rascally portrait painter and is afraid of getting burned again. The story serves only to give her opportunity for vacillation, doubt, joy, acceptance, and finally, with unconvincing reasons, for putting aside second love. The psychological complications permit some excellently done love scenes and some good writing, which sticks through the translator's work and her habit of leaving quite translatable phrases in the original French.

The Orchid. By Robert Nathan. The Bobbs-Merrill Company. \$2.

Robert Nathan's latest account of life as it is lived on that queer delightful plane which he has discovered, that new dimension in which sentiment, irony, and absurdity meet each other face to face, which is so like our own plane as to seem a travesty of it and so different that it is both humorous and glamorous, maintains the same high level established by his previous little volumes. If you enjoyed the wisdom and satire, the wit and sentiment, the humor and sadness of "Autumn," "Jonah," and "The Woodcutter's House," you will read "The Orchid."

Morning Tide. By Neil M. Gunn. Harcourt, Brace and Company. \$2.50.

This is a quietly moving novel of childhood and adolescence in a Scotch fishing village, naive and charming in places but on the whole suffering from the limitations of the author's method. Mr. Gunn appears to have forgotten that to render a world as a child might see it, more than a meager simplicity is necessary. In their sensitiveness the reactions of a child are likely to be subtle to the adult, where those of the adult may seem circumscribed and limited to the child. To present a child's world so that the grown-up person may share its charms is thus a doubled-edged problem. If the author of "Morning Tide" has not succeeded in this very well, he has at least caught some of the unsophisticated appeal of the Scotch village itself.

Three Steeples. By LeRoy MacLeod. Covici-Friede. \$2.50.

The criticism of a first novel is often of necessity evasive and equivocal. The author has virtues, but alas . . . Mr. MacLeod has written a first novel about which it is difficult to be equivocal. He has written a good novel—in fact, he has written two good novels. One is a study of the village of Midland, "somewhere in the eastern Middle West of the United States." The other is the story of Bruce Durken who has "gotten religion" somehow or other before the story begins. Since his conversion Bruce has one overpowering ambition, to become a preacher of the gospel of Christ. He antagonizes his father, who wants him to become a lawyer, and he practically loses his love, Myrtle. Finally, when he arrives at his goal, his father is killed; Myrtle, who has married another, dies in childbirth; Ab, his convert, commits suicide. He discovers that the "Great Good of the Church" had turned him aside and was really a mountain of Evil, that "Christ was dead and God only a great deafness over the world." Thereafter he aims to tell people the Truth, to show them that life is the only good, to correct the mistakes of religion. But

first he must destroy the church his father built. He sets afire and in trying to rescue someone from the flames is burnt to death himself. This bifurcated novel of meticulously studied background and the history of a "convert" is slenderly held together by the character Bruce. Were it not for the overabundance of detail about Midland, "Three Steeples" would hold the reader effectively by its sensitiveness and imagination alone. Midland is true, but Bruce is not the product of Midland. The forces that evolved Bruce receive inadequate attention, with the unhappy result that at the end the character seems a propaganda set-up, not the neurotic, fanatic child of emotion.

The Cross Bearers. By A. M. Frey. The Viking Press. \$2.50.

"The Cross Bearers" is probably as accurate a description of the war as one can hope to get; none of the horror is left out and much of it is underscored, for the hero of the account is a stretcher-bearer and medical attendant in the German army. The experience of shock after shock, of overwhelming incompetence, of perpetual suffering is detailed with unending minutiae. For some reason or other these experiences seem remote, not finally real—not as a nightmare is unreal, but ungraspable as facts. This may be owing to a defect in the author's method, for "The Cross Bearers" bears the marks of an honestly recorded experience.

The Blind Man. By Olav Duun. Translated by Arthur G. Chater. Alfred A. Knopf. \$2.50.

This is the second volume of Olav Duun's six-volume saga of four generations of a peasant family in nineteenth-century Norway. The first volume, "The Trough of the Wave," was issued here in translation last year; and the succeeding parts are promised for the future. "The Blind Man" is a complete novel in itself, a powerful story dealing with fundamental emotions on a plane that lies close to the soil. "The People of Juvik," as the completed translation is to be entitled, will probably be recognized as one of the great works in its genre taking rank with the analogous novels of Reymont, Hamsun and Sudermann.

Contributors to This Issue

HENDRIK WILLEM VAN LOON, author, satirist and cartoonist, is writing regularly for *The Nation*.

HENRY RAYMOND MUSSEY is at present in Europe studying economic conditions.

ANITA BRENNER, author of "Idols Behind Altars," is at present studying and traveling in Mexico.

HORACE R. CAYTON is a resident of Chicago who was an eye-witness to the eviction riots that he describes.

LANCELOT DENT is a member of the department of philosophy of the University of Virginia.

MORRIS R. COHEN, professor of philosophy at the College of the City of New York, is the author of "Reason and Nature."

GERALD SYKES is a writer of fiction.

UPTON SINCLAIR is the well known author of "The Jungle." His latest book is "The Wet Parade."

WILLIAM MACDONALD is a regular contributor of historical and political reviews to *The Nation*.

CUTHBERT WRIGHT is the author of "The Story of the Catholic Church."

FELIX MORROW is a contributor to the *Menorah Journal* and other periodicals.

THE NATION, No. 20 Vesey Street, New York City, Cable Address: NATION, New York British Agent of Subscriptions and Advertising, Miss Gertrude M. Cross, 23 Brunswick Square, London W. C. 1, England.

THE WRITING ON THE WALL spells "dole" in the opinion of most of the recent spokesmen for labor. William Green, president of the A. F. of L., issues a warning of dole or jobs for the unemployed; Senator Borah declares that the rich must, voluntarily or not, feed the unemployed: "If the public dole system is established by this country it will be forced by those who, having the means, refuse to do their part in feeding the hungry." Senator Pat Harrison of Mississippi declares himself opposed to a dole but points out the necessity of strenuous federal relief for the coming winter. In the midst of this melancholy chorus two voices stand out. One is the dulcet tones of our esteemed Secretary of Labor, Mr. Doak, who predicts that "before long" the United States will once more stand "upon the substantial plane of prosperity," due to the "strivings of men of thought and action." The other is the clear, practical, unromantic voice of Senator Wagner of New York. The Senator, too, indulges in prophecy and makes certain demands of the federal government: a public works program to give jobs to 1,000,000, to be financed by a bond issue of \$2,000,000,000, and to be commenced immediately; legislation immediately for the erection of a nation-wide system of employment offices, reduction of the working week, unemployment insurance, legislation to keep children out of industry, and modification of the Volstead Act. We much prefer the wise hard-headedness

of Senator Wagner to either the calamity-crying of Mr. Green or the fake optimism of Secretary Doak. If Mr. Hoover could bring himself to forget partisan politics and listen to a Democratic Senator from New York, he would place his feet at once upon firmer ground.

WITH PROFOUNDEST REGRET *The Nation* records the voluntary, or involuntary, abandonment of the proposed customs union by Germany and Austria just prior to the unfavorable decision of the International Court at The Hague. That decision we shall discuss at length next week. The court may be right, or it may not; the two countries may have been wise in bowing to the inevitable or not. But it is undeniable that it was the French loan to Austria which made them yield, and that that loan, according to all the dispatches, was coupled with the political condition that the customs union should be abandoned. This we consider a monstrous thing, utterly unworthy of the French people, entirely inimical to the restoration of economic sanity and of international amity in Europe. Who can maintain from now on that Germany and Austria are independent or sovereign countries? We venture to say that instead of decreasing the desire for a final political union between Germany and Austria, this will increase it. It is, moreover, another unanswerable argument for the revision of the post-war peace treaties at the earliest possible moment. France may persist in her position that they shall not be revised, but if the present economic chaos in Europe goes on much longer those treaties are likely to be abrogated by revolutionary forces before which even France will tremble. Why is it that so rich and powerful a nation as France is today so cowardly that it trembles at the thought of Austria and Germany uniting by themselves in precisely such a customs union as Aristide Briand has been asking for all of Europe?

THAT THIS DECISION is a serious blow to the World Court there is no gainsaying. That is not only because the decision was reached by an eight to seven vote but, what is more important, because it was plainly a political decision with the representative of France voting against the proposed customs union together with the French satellites, Poland and Rumania, supported by Spain, Italy, Colombia, Cuba, and Salvador. On the other side were the judges representing the United States (Frank B. Kellogg), Great Britain, Japan, China, Holland, and Belgium. We cannot imagine a more effective argument against the entrance of the United States into the Court than this most unfortunate decision and we venture to prophesy that it will be exploited to the full when, if ever, the Hoover World Court proposal comes to be debated in the Senate. What is more, this decision leaked out fully ten days before it was officially announced, and was cabled to the United States a week beforehand. The decision of Germany and Austria "voluntarily" to abandon the customs union was arrived at with full knowledge that the cards were irretrievably stacked against them.

IT WOULD BE BUT TARDY JUSTICE, indeed, if Mexico should be asked to enter the League of Nations as has been proposed by five permanent members of the League and the Spanish Republic. An *amende honorable* is surely needed, and unfortunately for the United States it must bear the burden of the blame for the deliberate refusal to invite Mexico to join the League when it was formed. The responsibility for this rests upon two holy men, Lord Robert, now Viscount Cecil, and Woodrow Wilson, both of whom opposed the invitation to Mexico because neither the United States nor Great Britain had recognized the Huerta Government which then ruled Mexico. As the *New York Times* dispatch reports, the omission "has also been attributed to personal animosity between Woodrow Wilson and President De la Huerta and to the oil question." All of which reflects admirably the spirit of arrogance and self-righteousness which actuated the heads of the Allied Governments at the time of the peace making. It was for them to decide the fate of the world—why should not personal animosity have its way? Viscount Cecil, reminded of his having opposed the admission of Mexico, replied: "Did I? I had forgotten. Well, it is best forgotten." Yes, indeed, but one might also express contrition, and ask forgiveness, especially if one is, like Viscount Cecil, a pillar of the Church. This is to be done by the Council of the League and the proponents of this act of justice who now declare correctly that the omission of Mexico "was wholly contrary to the spirit of the League."

PRESIDENT HOOVER has done an admirable thing in ordering the Department of Justice to investigate the use of brutal "third degree" police methods in the city of Washington which has already resulted in the indictment of five policemen. This is in response to the allegations in the Wickersham report which also made similar charges in regard to the police forces of New York, Chicago, and other large cities. For years past *The Nation* and its editor have been calling the attention of the New York City Bar Association to cases of torture and physical violence in police stations which have repeatedly sent prisoners, whether innocent or guilty, from the police stations of the metropolis to the hospitals. The facts are so incontestable that judges on the bench have repeatedly denounced the actions of the police. Several years ago in response to an article reviewing the facts, published by the Editor of *The Nation* in *Harper's Magazine*, a committee was appointed by Charles E. Hughes, then head of the Bar Association, to disprove those charges, or to take some action. But the great Bar Association of the greatest American city is unable to act beyond the gesture of wringing its hands and bemoaning the spread of lawlessness in America. To our minds there are only three possible explanations: Either the Bar Association comprises a set of moral cowards, or it is being pulled off by political influences, or it at heart approves of this police lawlessness.

HERE IS, FOR EXAMPLE, the case of four Brooklyn gangsters who were beaten and tortured into confessing murder. Their attorney went before Justice May and obtained from him an order for the examination of the prisoners by a doctor appointed by the court and for the photographing of their injuries. The attorney informed the court that the men "are black and blue from head to foot. There are few

white spaces on their bodies. The police used blackjacks and other blunt instruments. The alleged confessions were wrung from the men, but these confessions were only signed so that the police beatings would cease." We do not for one moment doubt the correctness of this statement, for this sort of thing goes on every hour of the day in some police station, as the Wickersham report proves. It seems utterly incredible that this can be taking place in a country that calls itself civilized, that boasts of its bar associations and the high standing of its lawyers. It could probably be stopped by the simple expedient of passing a law making any confession invalid that was not made in the presence of the prisoner's attorney. Such a law could be obtained in shortest order if a very few men like John W. Davis, Charles E. Hughes, Samuel Untermyer, Elihu Root, and Henry L. Stimson, would demand it in concert. But the torturing of human beings stirs their hearts neither to mutiny nor rage, nor do the constant miscarriages of justice and "framing" of men who sign confessions to avoid suffering worse than death. Yet doubtless if anybody should tell them that every day uniformed men subjected dogs and cats to such horrible tortures contrary to all law and decency, they would cry out to high heaven in protest.

"WE ARE NOT AT WAR and we are by no means threatened with war. There is no need for a big navy, and there is no need for a big army"—thus Representative Will R. Wood, chairman of the House Appropriations Committee, on leaving the White House after a conference with the President on September 1. These are most refreshing words and they may be extremely significant because of the steadily mounting deficit, and because Mr. Wood's word has been law with the Committee during the several years he has been Chairman, provided, of course, that the new House is organized by the Republicans, and reappoints him to that position. It is a sound and sane sentiment he voices. For a century of our national existence our regular army never went above 25,000 men, our militia was negligible, and so was our fleet except in war times. To maintain now, when the whole world is bankrupt, when nobody knows whether or not the capitalist system will survive in Europe five years from now, when there is not a single fleet in the world that ranks with our own, save that of the mother country, to go on spending three-quarters of a billion dollars annually for wars past and future is the height of absurdity.

FAIRMAN R. DICK, chairman of the Railroad Security-Holders' Committee, is the latest to declare that government ownership for the railroads is definitely in sight unless railroad earnings are at once improved. He even declared, according to the dispatches, that the flight of capital from American railroads is more severe today than the flight of capital from Germany during its most crucial period. He pointed out that the decline from the 1930 high mark in the average price of refunding mortgages of the leading railroads now amounts to twenty-eight points, or eleven points more than when the hearings on the application of the railroads for a 15 per cent increase in freight rates began early this summer. He went so far as to say that the present railroad credit situation is much worse than it was in 1920 when the Government came to the rescue by an increase in

freight revenues, the creation of a revolving fund, and other legislative measures. No one can deny that the situation is extremely serious, or that the Interstate Commerce Commission is between the devil and the deep sea. An increase in freight rates, the shippers and public think, will decrease business and retard the economic recovery of the country. Railroad heads privately declare that if they do not get at least a 5-per-cent increase some large receiverships will be inevitable, further adding to the depression and further injuring the security markets. They do not, of course, maintain that this 5-per-cent increase will give them what they need; they merely say that it will increase public confidence in the railroads through its psychological effect and will help to keep up the credit of the roads.

ATTORNEY GENERAL BENNETT of New York has sent a questionnaire, asking information on twenty-one points, to about 300 management investment trusts doing business in that State. This move to check up on any possible weak spots or unsound or fraudulent practices is a salutary one, but the information will lose at least half of its possible usefulness if it is not used as a basis for stricter legislation controlling the activities of the trusts. They have already been permitted an almost uncontrolled growth on an amazing scale, and the scandalous practices of some of them have resulted in the ruin of thousands of small investors who imagined that they were putting their money into an unusually stable form of investment. As the investment trust should, next to the savings bank, be peculiarly the refuge of perplexed investors who are looking for stability, expert management, and diversification in their investments, it must eventually be put under much the same type of State regulation and supervision as savings banks and insurance companies. The sooner the States have adopted legislation dealing with such matters as periodic publicity for investment-trust portfolios, uniform accounting practices, compensation for management, and limitation of purchases of the securities of individual corporations, the more future trouble they will save themselves.

GOVERNOR ROOSEVELT has urged upon the New York Legislature a statute outlawing the private possession of machine guns. With that proposal everyone, we think, will agree, and also with further suggestions made by the Commissioner of Police of New York City for the strengthening of the law in regard to the private use of pistols. But the Governor is himself in doubt as to the wisdom of the further demand of the New York police for a speedy trial of a gangster before a city magistrate, a summary jail sentence to the work-house or probation for a term of at least two years, merely on suspicion or knowledge that the man is or has been a gangster and without his being convicted of any specific act. In other words, the police wish the extension of the present much abused vagrancy acts, which permit the police to railroad to jail anybody they pick up and do not like, provided he happens to be without means. The Governor thinks that such statutes should be tried for the period of one year if at all. We are of the opinion that they should not be tried at all. The New York police in forwarding this request to the Governor openly confessed their inability to keep up with gangster crime. The chief trouble is that all our American police forces are brutal, un-

scientific, wrongly managed, and rotten with politics. The only real way the police have of getting so-called evidence is by beating up their prisoners. It is ridiculous to assume that more legislation will increase their efficiency.

HERR HITLER is beginning to show signs of delusions of grandeur. To a meeting of one thousand of his lieutenants he announced: "I feel myself the representative, responsible guide and leader of the last hope of innumerable millions of Germans. Come what may, here I stand and stay and nobody can force me from my place." Again, he declared that "it is not our policy that is responsible for the present misery, but it is our nation which must suffer, and therefore I am ready to shoulder the people's suffering through responsibility." This vain-glorious talk gives the measure of the man, as does the fact that he again wholly failed to define his new policy, to suggest new remedies for German ills, or new roads to German economic recovery, save to declare as always that Germany "must cut loose from all foreign entanglements since it cannot be saved by outside help." Germany's defeat on the customs union, which he declared he had prophesied, he correctly described as "catastrophic," and it will be a great talking card in the Hamburg electoral campaign just beginning, the result of which must be looked forward to with great apprehension. It is a curious fact that the more France persists in her ruthless anti-German course the more she encourages and strengthens these Hitler forces which are pledged to denounce the peace treaty and to cease all payments to France and the Allies the minute they take office. Sometimes one wonders whether France is not deliberately planning for anarchy in Germany.

THE DOVE OF PEACE has descended on Italy, and temporarily at least a reconciliation has been affected between the Fascist Government and the Vatican over the much mooted question of the Catholic Action, or young people's organizations. The church has agreed that these associations are to be formed and conducted for religious and "supernatural" ends only. "Catholic Action will take no part whatever in politics, and in all the exterior forms of its organization it will abstain from all those things which by tradition properly belong to political parties. The flag of the local associations of Catholic Action will be the national flag." So runs the communiqué issued by the Government. The church has gone a step farther and has agreed that the clubs must refrain from any athletic and sporting activity, "limiting themselves purely to recreational and educational activities with religious ends." It would seem that the agreement gives Mussolini the edge over his priestly adversaries. The state is declared supreme in all practical matters, and any yearning the church may have to engage ever so slightly in activities of a political or particularly anti-Fascist nature is severely repressed. This leaves God's Vicar on earth in a slightly anomalous position over the question of primary allegiance. It will be difficult in the future, as it has been in the past, to divide to the satisfaction of everyone, including Italy's megalomaniac prime minister, Caesar's possessions from God's. In a month, it is predicted, a further agreement will be announced settling once and for all the vexed question of the education of youth, and incidentally making it clear who has come off final victor in the controversy.

Cut Reparations Now!

IT is hardly an exaggeration to say that the economic fate of the world today lies chiefly in the hands of one man, and that man is President Hoover. No matter where one looks in the economic crisis that now grips the whole civilized world, one must turn back to Washington and to the White House. Only from there can come the initiating steps that could give the best hope of restoring confidence and of setting the world back on the path of economic recovery. If Mr. Hoover takes the wrong action, if he takes no action at all, or if he delays taking action, the nations must plunge ahead to economic catastrophe.

The chief focal point of economic infection today is Germany. We have just had an ominous illustration of how intimately related is the economic fate of great nations in the promptness with which the financial crisis in London followed that in Berlin. The illusion of our own national self-containment, under which our political policy has been conducted in the years since the World War, has helped to bring the world to its present crisis. The world—including the United States—cannot prosper if the external purchasing power of a great nation like Germany is wiped out. It cannot prosper without assurance of Germany's economic and political stability. It cannot prosper, in brief, as long as the present crushing burden of Germany's reparations exists. Virtually every disinterested authority admits that the present scale of reparations payments is far in excess of anything that Germany will be able to pay continuously. The reparations payments have been grossly excessive from the beginning, but until the recent crisis revealed the true state of affairs, the statesmen of France and the United States were able to live in a fool's paradise, or at least to keep the great bulk of those who supported their policy in a fool's paradise. At last it is recognized that since 1924 Germany has been able to make its payments, not out of its own resources, but only out of money borrowed from abroad. It required a panic to bring this process of borrowing from Peter to pay Paul finally to an end.

There is no way out of the present world crisis unless the annual reparations payments that Germany is called upon to make are drastically slashed—and that major operation must take place within the next few months. In however guarded the language, this was the conclusion of the Wiggin Committee, representing the bankers of ten nations, a conclusion subscribed to, it must not be forgotten, by the French and Belgian representatives. The committee pointed out that "until the situation in Germany improves there can be no general recovery"; that neither the Hoover moratorium nor the recent agreement to "freeze" German short-term banking debts for six months was likely to prove of the slightest value "unless all the governments concerned . . . lose no time in taking the necessary measures for insuring Germany's solvency." Outside confidence, it went on, can never exist as long as Germany's obligations, "both public and private, are such as to involve . . . a continuous increase in snowball fashion of the foreign debt of Germany." "We think it essential," the committee concluded, "that before the period of prolongation of credits recommended by the

London conference comes to an end" the world's governments reduce the payments demanded of Germany to a level where they will no longer be such as to "imperil the maintenance of her financial stability."

The National City Bank in its September letter has pointed out that when the Hoover moratorium was first proposed its purpose was said to be "to give time to permit debtor governments to recover their financial prosperity." "It would appear miraculous, however," the bank comments, "for such recovery to take place within a year. The uncertainty that exists is casting a blight over business everywhere."

Following the publication of this statement, the New York Times's Washington correspondent declared that President Hoover would "not be prone to favor scaling down wartime debts owed the United States, at least before corresponding reductions are made in German reparations." If this correctly reflects the President's attitude, it means that he is not prepared to do anything until the initiative has come from France, and that even if Germany's reparations are scaled down, he promises nothing. The *Herald Tribune's* report is even more emphatic; it declares that the Administration "has no desire or intention to suggest any important step with regard to war debts and reparations in advance of the disarmament conference now scheduled for February 2 at Geneva."

Such a delay would be nothing short of disastrous. The President must act, and he must act now. It is no longer possible to argue that the German reparations are the exclusive concern of Germany and the Allies. It is no longer consistent even for Mr. Hoover, after his own general debt moratorium, to contend that there is no connection between war debts and reparations. It can no longer be possible for anyone seriously to believe, after Mr. Hoover's struggle to have France accept even the general moratorium, that the French could be moved to accept a reduction in German reparations without some corresponding reduction in their debts to America and Great Britain. A policy at this time of timidity, hesitation, "watchful waiting," a fatuous Micawberish optimism that persists in believing that by some miracle things will right themselves without audacious and immediate action, can only bring calamity. When Mr. Hoover boldly announced his moratorium plan, he received virtually the unanimous support of the American press, and of the leaders of both political parties. He will find a similar support if he acts with courage and decision now. Only leadership, not a baseless hopefulness, will do. Mr. Hoover's action could take several forms. He could come forward, as he did in June, with a clear and definite proposal of his own. If a complete wiping out of war debts and reparations seemed to him politically impossible, he could propose that both debts and reparations be immediately reduced by 50 per cent. Or he could propose a conference of heads of governments, or the appointment of an international committee of experts instructed to turn in at least provisional recommendations within a period of not more than one or two months. But whatever is done, it must be done without further delay.

The Y. M. C. A. Moves Forward

WE have already offered proof of the zeal among the churches and religious bodies for peace and a new order of society. Nothing that we have recorded so far has given us greater encouragement than the decisions arrived at by the series of international conferences lately held by the Young Men's Christian Associations. There were two assemblies at Toronto at the end of July, followed at Cleveland by the forty-third International Convention of the Associations of the United States and Canada, and by the Twentieth Conference of the World's Alliance of Y. M. C. A.'s. To the latter there were no less than 1,028 delegates from forty-seven countries, many of them being aided in coming by a fund of \$22,000 subscribed by 30,000 boys in the United States and Canada. The discussions were remarkably free and frank, covering a wide range of subjects such as family and sex life, interracial and international relations, disarmament, industrial and economic problems—in brief, there was the completest recognition of the fact that it is impossible longer to divorce the activities of any religious or semi-religious body from the challenging issues of our rapidly changing social and political systems. The world is moving; the church cannot stand still and hope long to survive.

That the Y. M. C. A., in the past usually ultra-conservative and unwilling even to discuss "dangerous" issues, is becoming liberalized appears clearly from the resolutions passed concerning race relations, especially if one recalls its Jim Crow policy in the United States. The conference recommended by formal vote that in calling national gatherings "in any country care should be taken to see that all delegates may be received *without discrimination as to accommodation and privileges*." It urged local associations to provide platforms for differing races throughout the world, and to bring together everywhere the "choicest spirits of differing racial groups for conference and acquaintance." Even more encouraging is the fact that it declared these to be merely "next steps"; that, while it recognized possible limitations at present "on the distance any local association may go in serving racial groups together," it urged these next steps in order that the "ultimate goal of the institution may speedily be reached, namely, the enlistment and full participation of all classes of young men and boys in the community without distinction of race, culture, or nationality." No feeling that this action has been too long delayed can prevent our calling attention with gratitude to the fact that this powerful Christian association has nailed its flag to the mast, that it now stands for absolute social and communal equality, without which surely no religious association has the right to carry on in the name of Christ.

Equally gratifying were the resolutions on industrial questions which are radical enough to make many of the rich and reactionary donors to the Association angry and afraid. The conference calls for the acceptance, as the only basis of industrial relations, "of the principle of cooperation in service for the common good in place of unrestricted competition for private advantage." It placed squarely upon

industry the welfare of the worker and his family outside his wage "and particularly for his contentment and his widened outlook upon life through some just and equitable participation, beyond his wages, in the fruits of his work." It also demanded the modifying of the industrial order in such a way as to prevent in future the recurrence of such a period of destitution and unemployment as now confronts the entire world. It called upon all locals to offer their services for the settlement of any dispute between employer and employee. The convention affirmed the right of all men to work and to a living minimum wage. It asked the five-day week, declared for the right and social necessity of working men as well as employers to organize, and demanded universal insurance "socially administered at cost against invalidism, disabilities from illness, and occupational injuries, want in old age, and enforced unemployment."

In international questions there was also admirable plain speaking by both conventions. The North American branded war as "destructive of all essential Christian values," and demanded of the Governments in Washington and Ottawa that the selection and instruction of delegates to the Geneva Disarmament Conference be such that the "whole weight of the two countries shall be thrown upon the side of thorough-going disarmament." In the World Conference 986 delegates voted "to dissociate themselves from the injustice of attributing to one nation or group of nations alone sole responsibility for the [World] War." They, too, demanded "actual and considerable reduction and limitation of armaments" by the Geneva Conference. These are encouraging actions. They again make it clear that it is not people but governments which block the road to international amity and peace.

A Celebrated Novelist

BERNARD SHAW, reviewing "The Manxman" many years ago, and reading on the theater program: "By Hall Caine, the celebrated novelist," characteristically began his review: "Who is Hall Caine, and why is he celebrated?" The review went on to say that obviously the inhabitants of the Isle of Man, where the story was laid, spoke a dialect of their own; for example, they never said "forever"; they said, "Come weal or woe; come life or death." It was evident that Mr. Shaw at that time and perhaps thereafter did not take Hall Caine seriously as a writer, nor did any other critics of reputation. But the public did. And when he died on August 31 at the age of seventy-eight, it was as a man of wealth derived from the sale of many hundreds of thousands of his novels, not to mention the receipts from motion pictures made from their obvious and long-drawn-out plots.

If the public took Hall Caine to its bosom as a writer of parts, he thought of himself in no less eminent a light. At fourteen he was apprenticed to an architect, but even then he longed to be a writer, and he broke into journalism as soon as he possibly could. By the time he was twenty he was a dramatic critic; a few years later he was writing editorials for the Liverpool *Mercury*; and before he was thirty he had published a volume of sonnets and "Recollections of Rossetti," the latter written after he had been the poet's

retary for two years. It was characteristic of Hall Caine that after Rossetti's death he wrote always in the great man's armchair, as it was that he let his hair and beard grow to flowing lengths, and attired himself in a broad-brimmed hat, black cloak, and wide belt, so that his striking figure attracted attention wherever he went. He thought always of his writing, composing a chapter before he arose in the morning, "mentally revising" it before breakfast, and then writing it rapidly from memory, "as fast as the pen will flow. The rest of the morning I spend in lounging about, thinking, thinking, thinking of my book." If the results of these arduous labors were less striking than the critics would have wished, the mass of readers had no complaint. The drama of the novelist's dress and mode of procedure was the same drama that appeared in the novels. It was obvious, it was unsubtle, it was superficial. But it was indeniably arresting, it was lavish of detail; it commanded attention by its very length and breadth, if not by its depth.

The plots of the novels were usually taken from the Bible. The prodigal son, Jacob and Esau, David and Uriah, Samson and Delilah, found themselves translated into nineteenth century terms and rendered suitable for a decorous Victorian audience. And the themes that Hall Caine stressed were old themes, religion played a large part in them, the complications were numerous and lengthy, the pathos was not slighted or passed over for romantically happy endings. There was no high tragedy, but the thousands of readers never missed it, so engrossed were they in having a good, elevating, tender-hearted cry over the misfortunes of these heroes and heroines involved in difficulties never quite of their own making. It is not unlikely that one day—may it be a long way off—we shall be writing the same sort of obituary notice about Harold Bell Wright, in many ways the Hall Caine of the United States. He, too, counts his readers by the thousands, even millions; he, too, is rich with the profits of literature; he, too, is scorned by the critics and politely ignored by the intelligentsia. But he answers a need that is genuine and widespread in his particular civilization.

Hall Caine answered a need that was as genuine in his. It was a need for romance tinged with melancholy. He was more successful than the scores of other writers who tried to provide it as he was more hardworking, more careful and generous with detail, more willing to fill in the last tender conversation, the last unhappy situation. "The Woman Thou Gavest Me" took some 400 pages to permit the unfortunate heroine to die a languishing death in the arms of the lover she was not permitted to marry. There was certainly little reality in the 400 pages; but there was plenty of romance, there was virtue beset, there was love fulfilled, there was sin punished, there were the long shadows of the implacable church demanding retribution, though with ever so gentle a breath. Readers devoured, wept, and begged for more, as they always will. And Hall Caine was able to give it to them. When the movies came, it was inevitable that they should seize upon these plots with avidity and present them with their own kind of distinction. The royalties came rolling in. The simple, kindly man in his Manx castle had worked for his fame and had achieved it. There will be few to begrudge it him, for one way of measuring greatness is by sheer numbers of devotees, and of numbers Hall Caine had a generous plenty.

The DO-X

THE great Dornier flying boat which finally arrived in New York on August 27, after being nearly ten months on the way from Germany by way of South America because of various delays, is not a new departure in aviation comparable, for example, to the development of the autogiro. It is simply an enormous airplane which once flew with 160 persons on board, and in one of its flights over New York easily carried 89 people. There is no new principle herein. Herr Dornier has merely undertaken to show that airplanes can be built of such a size as to make them commercially profitable. Contrary to general belief the DO-X is not equipped for night flying, and is not able to cross the Atlantic directly. Its flying radius is limited at present to 750 miles, its maximum speed is 128 miles an hour, and its cruising speed 103 miles. As it flies through the air only its size differentiates its appearance from that of the usual airplane. It has not as yet made any new contribution to our knowledge of the technique of trans-Atlantic flying and is no safer from the dangers of fog and of the formation of ice than any other airplane.

How great then is the gain? That has been set forth by Lieutenant C. H. Schildhauer of the United States Navy, who has been connected with the DO-X for more than a year, and has acted as one of its co-pilots. He points out that a small flying boat must carry the same amount of safety and navigation equipment and radio apparatus as a larger ship. In the DO-X the safety equipment, therefore, makes up only a very small portion of its weight. The DO-X is actually licensed by the German Government for a gross weight of 106,000 pounds. Fully equipped with cabins, radio, engines, kitchen, two toilets, and a bar, the ship weighs 71,000 pounds. This leaves available a margin of 35,000 pounds to be divided among fuel, oil, crew, and passengers. Lieutenant Schildhauer has figured out that, operating the DO-X 1,200 hours a year, the operating cost, with full allowance for overhaul, maintenance, wages, depreciation, and insurance, comes to \$439.75 an hour. Allowing 13,200 pounds for fuel, on the basis of a 500-mile run, and 1,700 pounds for the weight of the crew, there remain 20,100 pounds for pay load, or about 100 passengers. The cost per passenger-mile works out at \$.04275. In addition, there must be added, of course, executive, administrative, traffic, terminal, and other overhead expenses. None the less, the Dorniers and Lieutenant Schildhauer are certain there will be an opportunity for a handsome profit.

Herr Dornier has, of course, been much criticized for jumping at once to so great a ship. The answer is that the day the DO-X arrived in New York a sister ship was being delivered to the Italian Government, which is notably progressive so far as aviation is concerned. The pioneer who makes a radical departure is, of course, bound to be criticized. Already the engineers have learned many ways of improving the vessel and saving weight. They have, moreover, the utmost faith in the safety of the ship, which handles so easily that any experienced air pilot can fly her after a short experience. The officers are even certain that she is a great deal safer than the elevators in the latest New York skyscrapers, which occasioned them awe and some anxiety!

Speaking of Revolution . . .

By HENDRIK WILLEM VAN LOON

"HIS Majesty has never felt so well in all his life."

The bright young genius who was responsible for this marvelous line will forever remain unknown. More is the pity. In another thousand years he would have been the Patron Saint of the Advertising Guild.

His Majesty had never felt so well in all his life, and with good reason. His Majesty had merely fed half a million men to the wolves. His Majesty had merely lost an empire. His Majesty had constructed a little island in the middle of the Beresina River, composed entirely of corpses wearing little bits of His Majesty's glorious colors. Now His Majesty was on his way back to His Majesty's capital. The frozen remnants of His Majesty's defunct armies could shift for themselves or die. His Majesty had never felt so well in all his life, and that was all that mattered.

His Honor has never felt so well in all his life.

His Honor, graciously parading before the eager press correspondents of half a dozen continental cities, is happy to make this confession. And why not? It is true that the city which the Voice of God, speaking through the mouth of the Sovereign People, had entrusted to the care of His Honor is suffering from certain minor ailments which are slightly out of keeping with her well-rounded boast of being the richest center of the world. What peasant greed has not plundered lies debauched by the lecherous touch of the dwarf-minded gunman. Her courts are an object of scorn and contempt. Her laws are the play-thing of shysters. Her waters are polluted by the filth of a whole country-side and her children are murdered and maimed whenever the thieves fall out among themselves.

But what of it?

His Honor has never felt so well before in all his life. The beer is marvelous. The music is grand. The company is first-rate.

So, why worry?

This world is a battle-field between the Fatuous and Facts.

The Fatuous in their fatuity will never learn this tragic lesson. They will continue to mistake their cheap and shoddy way of thinking for wisdom. They will proclaim themselves safe behind a bulwark of clever quips when the enemy is already in full possession of the outworks.

Yea, they will posture and play the pantaloons when Fate has long since ruled them out. All of which would make them pathetic if at the same time they were not quite so dangerous.

For many honest citizens do not know the difference between a roar and a bray. And they fail to observe the

ass's tail dangling from behind the moth-eaten lion's skin, hired for the purposes of the evening's entertainment from the theatrical storehouse.

The result is apt to be disastrous, as two thousand years of written history would teach us if history could ever teach us anything at all.

But Waterloo comes and Waterloo goes and in less than a hundred years it survives as a picture postcard—or a cigarette case with a portrait of Blücher and the Little Corporal.

"His Majesty never felt so well before in all his life."

"His Honor never felt so well before in all his life."

And the dear brethren in Moscow rub their hands. Some one else is working for them. Some one else is always working for them.

And we sit by and applaud and shout "Hurray!"

For the Fatuous will inherit the earth.

But only for a short while.

And we remain behind to pay the bills.

This is a time when even the most indifferent of spectators is tempted to leave his comfortable seat in the grandstand and join in the game.

He may not wish to take part, but he can hardly help himself.

Then the mob shouts, "Hey, Mister, which side are you on?" and expects a definite answer.

That is no more than fair and here is the answer on the part of the author of this humble page.

Cal Coolidge, when asked what the minister had said about sin, answered:

"He was agin it."

To those who kindly write to inquire whether or not I cast a longing glance in the direction of Moscow, I answer as definitely and unequivocally as I can:

"I am agin them."

At the same time, I see them advancing all along the line. I watch them pitting their harsh intelligence against our befuddled sentimentality and I am forced to stand by while amiable but vapid ladies and gentlemen offer to defeat these desperate poker players with peanuts and Confederate money.

But worse and more dangerous than these well-meaning but futile saviors of Western civilization are those who consciously and willingly encourage and promote those economic and social conditions which are the ideal breeding ground for the pestiferous Moscovite bacilli.

The Mayor of New York, by his desertion of the city at the moment when the city had reached her lowest pitch of civic decency, rendered a signal service to the little playmates of the late (and sincerely lamented) George Bernard Shaw. For this God may forgive him. That is God's business.

But I have my doubts about posterity.

The Bathtub Comes to Russia

By LOUIS FISCHER

Moscow, August 13

AMIDST the pounding of hammers and the noise of construction in Russia, the still small voice of culture calls persistently. I have just returned from a visit to Dnieperstroi and to the new tractor plant at Kharkov. It is interesting to view the largest dam in the world which, with the factories and workers' homes surrounding it, costs the Soviet government almost half a billion dollars. The sight of an enterprise with an annual production capacity of 50,000 tractors is impressive. But against the titanic background of the Five-Year Plan, the welfare of the individual, the personal and the human, plays a huge role.

Alexander Winter, an old intellectual Bolshevik, is the director of the Dnieper Dam project. I dined with him one evening in the engineers' club. The cook came in to supervise the last arrangements. His apron was horribly dirty and torn, enough to destroy anyone's appetite. Winter frowned. "You are a disgrace," he said to the cook. "It is the proletarian way," the cook replied. "No," Winter declared, "it is the swinish way." Some Russians attempt to make "proletarian" cover a multitude of sins against culture and cleanliness, but the Communists struggle against such a tendency.

When Alexander Winter came to the spot where now stands the 192-foot high concrete dam, the place was a rolling sandy steppe, uninhabited, worthless. Absolutely nothing had changed since Catherine the Great sat on the tiny island just below the dam and entertained her foreign ambassadors. The broad Dnieper swirled swiftly over innumerable rocks in the bed of the stream. Men fished with nets from the granite boulders that jut out of the water, peasants plowed lazily on the banks with their crude equipment, and the inertia of centuries ruled the scene.

Winter's first interest was to construct homes for the workers and engineers. A little town has now grown up at the dam, consisting of fine one-story brick cottages supplied with electricity, bath tubs, running water, and other modern facilities. This was to have been expected. But Winter also concerned himself with the aesthetic side of life at Dnieperstroi. Under his inspiration, gardens were laid out around the houses, and rows of trees planted along the streets, so that the suburb now looks more like a park than a typical Russian settlement. It is particularly conspicuous because the Ukrainian steppe is completely bare of trees, and because Russians never built this way before. Such cultural achievements must be viewed against the Czarist and not the Western background. Russian workers formerly inhabited hovels with little light or comfort. They still have to be taught to take proper care of their new bungalows. They must learn to appreciate a blade of grass at their front doors and flowers on their window-sills.

Culture in Russia still means personal cleanliness. What Russian factory-hand had a bathtub in his house before the revolution? Now all newly constructed dwellings are equipped for bathing. Culture in the Soviet Union still means a correct diet. When a Russian says vegetables, he

thinks of cabbage, onions, and potatoes. He will not eat "grass." The Communists must occupy themselves with this problem, too, for the tasks of Bolshevism include the workingman's daily menu as well as the destruction of private capital, the care of newborn babies as well as agricultural collectivization, poets' activities as well as the building of foundries. It is natural, therefore, that the management of Dnieperstroi has solicitously aided the development of a five-hundred-hectare State Farm on an island in the Dnieper, which already grows tomatoes, cucumbers, lettuce, green peppers, squash, and grapes for Dnieperstroi, and nursery trees for transplanting near the dam.

I viewed the farm, in company with a prominent Bolshevik. Electric plows are used for deep furrows. Greenhouses have been installed where the ground will be heated with electricity, so that vegetables may be supplied all the year round. The Russian laborer never dreamt before of such attention to his needs. Now he expects and demands it. In fourteen years his standards have changed beyond recognition.

We stopped in the rice field. The young plants stood in six inches of water. My Bolshevik companion thereupon told of experiments in the northern Caucasus where the rice-plots were periodically flooded and then drained, so that the harvesters would not have to wade in water and slush. He said this quite incidentally, yet this human side is fundamental to Russia's economic development.

I discovered that Svistun, the director of the new Kharkov Tractor Factory, though he is burdened with a most trying task of construction and management, also pays a great deal of enthusiastic attention to "details" of culture. Born a peasant, Svistun was an ordinary worker before the 1917 revolution. Now he directs the building of a \$65,000,000 plant whose various shops cover thirty acres of floorspace. He will manage it when, after completion in October of this year, it will employ, at capacity production, eleven thousand men and turn out a \$1,000 tractor every six minutes. The orders he placed with American firms for complicated machines kept many an Ohio factory busy for many a month. Yet to look at him one might have imagined he earned \$6 a week as shipper's assistant in a retail store. He wore a plain grey Russian blouse, a pair of patched trousers from which the nap had long disappeared, and a pair of old shoes very much down at the heels.

"We make tractors," Svistun said to me, "but I also want to make new men." This has required a struggle. Once, when Svistun addressed a workers' meeting and urged those present always to have clean hands and finger-nails, some smiled and others sneered. But they are beginning to accept the suggestion. Svistun insists that all benches, machines, and shops be immaculately cleaned at the end of the working shift. Each handle must be turned the same way; each chair and tool has its place. On one occasion, Svistun criticized a machinist for leaving some particles of scrap-metal on his machine. "Do you expect me to lick the machine with my tongue?" the worker retorted with irrita-

tion. Svistun said nothing. Another employee, however, heard the conversation and reported it to his fellows, who convened a factory meeting and decided that the machinist be dismissed.

Receptacles have been placed at intervals throughout the new tractor plant for refuse, and in the clubrooms for cigarette ends. Spittoons are available in every corner. At first, the workers used them rarely. Svistun discovered several flagrant violators, made examples of them, visited their homes to see how they lived and talked informally with them. Now public opinion commences to be with him. "When a man grows up in dirt," Svistun declares, "he becomes accustomed to it and thinks it's all right. But I cannot work when the floor of my office is filthy and I believe that a disordered shop hurts production."

Before the plant turns out a single tractor, Svistun promises, the entire tremendous area and all the ground between the buildings will be made spick and span. Every bit of construction debris must be removed. "That will have a psychological effect on the workers," says Svistun. Flower-beds are to be planted in the open spaces surrounding the various buildings, and a wall of trees is to be planted around the whole works. The Agricultural Equipment Factory near Rostov-on-Don is similarly decorated and presents a refreshing sight.

For four unbroken hours I walked through the tractor factory. In one of the shops a sign on the bulletin board caught my eye. It gave the name of a workers' club and a date, and then it read: "PUBLIC TRIAL of Citizen Shuvalov for infecting a woman worker of the Kharkov Tractor Plant with venereal disease." The trial is unofficial. But it will be conducted in the usual court fashion, and the workers of the factory may sentence Citizen Shuvalov to dismissal from the plant, or give him a social reprimand. At any rate, the trial itself and the advertisement it gives to his behavior and condition are sufficient punishment. But if the branded citizen behaves arrogantly, or if it develops that he was conscious of the wrong he was doing, the factory-workers' collective may turn him over to the authorities; for in the Soviet Union such crimes are punishable by law. Trials of this nature are one of the numerous forms of cultural education.

A new campaign for personal hygiene and cleanliness is sweeping the Soviet Union, and new plants like the Kharkov Tractor Factory spend much-needed money on facilities that conduce to sanitary conditions. As a worker enters his shop, he passes a wardrobe room where he deposits his overcoat, cap and galoshes, and receives a brass check. Near his bench is a locker. Here hang his blue trousers and jacket which he exchanges for his street-clothes. All this may sound very ordinary. But for backward Russia it is a revolution. Its cultural implications can scarcely be exaggerated. Russia grew up in dirt and almost came to like it. Now the habit is slowly being broken.

Very slowly. Homes for four thousand families have been erected within a stone's throw of the tractor factory, just outside the city of Kharkov. They were no sooner partially completed than the people began to occupy them. Some apartments still have no water, yet they are inhabited; for they are an improvement on the wooden barracks in which many laborers have been domiciled for months.

I visited these new houses with Svistun. They are

three, four, and six-story structures, clean, with much window and corridor space. Svistun, of course, did not know the people who occupied the hundreds of apartments, and it was not necessary. He merely knocked at doors and asked to be admitted to inspect the premises. "A foreign correspondent," Svistun said politely as the door opened, and we were readily admitted. Russians are excessively hospitable, and only skilled diplomacy enabled us to escape from each apartment without listening to lengthy autobiographies and drinking tea from a sizzling samovar.

I was especially interested to see how the working-class families lived. Quite a number of them had received two and three-room flats, each with private kitchen and private bath. Rent was so low, that in several cases the housewife did not know what the amount was. Her husband paid it. (Six to eight per cent of salary is the usual Soviet rent.) I entered about twenty apartments. In each case I asked: "Did you ever own as good a home or a better one?" They looked at me strangely, smiled, and invariably answered in the negative.

In making the rounds, I came upon an American woman whose husband had been a skilled mechanic in Detroit and was now working at Soviet invitation in the tractor plant. Both were ex-Russians. With a daughter of ten, they occupied a two-room apartment plus kitchen and bath. It was immaculate. It might have been situated in any modern house in New York or Philadelphia or Berlin. The decorations were tasteful. Order reigned in every nook. A few minutes later we were welcomed into the dwelling of a Czech worker. It was an exact copy of the American-Russian apartment, but not so clean. It represented a step downward.

Next we came to an apartment similar to the other two, but Russian. Here one noticed a sharp difference. The bathtub was being used to soak laundry. Cans, boxes, and a refuse container stood in the bathroom. A number of heavy, cotton-padded overcoats, many dresses and trousers, hung on nails on the walls. The kitchen range was dirty. A baby cried in the crib. On one wall, arranged like the spray of a fountain, hung scores of postcards, family photographs, colored landscapes, and portraits of Soviet leaders. Flies everywhere. This was still another and a big step downward. Obviously, it is not enough to give excellent apartments to people who are not accustomed to living well. A gradual process of education is necessary, together with a lot of propaganda. The Russians are certainly getting the propaganda. All Bolshevik leaders continually stress the cultural backwardness of the nation and the need of bending every effort towards its elimination.

Stalin, in a recent speech to cooperators which has not been and may not be published because of its acerbity, sharply criticized the managers of cooperative stores and factories for their failure to deal with the "petty" problems of cleanliness and order. Dirt and ugliness were so much a part of proletarian life before the revolution that sanitation came to be sneered at by the worker as "bourgeois." This psychology persists, and acts as a barrier to hygienic conditions in homes, plants, and especially in restaurants. It is very fortunate, therefore, that Stalin, whose recent addresses have made him by far the most popular figure in Russia, should have occupied himself with these "minor" questions. Stalin aims his fire against those who declare that because

conditions are better now than in pre-revolution days, there is no cause for complaint. "Only rotten and thoroughly tainted persons," he stated with customary bluntness, "can comfort themselves by comparison with the past." *Pravda*, too, launches an attack against Bolsheviks who justify their neglect of hygiene by affirming that it "was worse before."

Now that Stalin has evidenced his interest in this phase of Soviet life, an improvement may soon be expected. I notice already that many cooperative shops in Moscow have taken on a brighter aspect. Communist "light cavalry" detachments have been organized throughout the country, and these days the press reports their "raids" on food cellars, workers' homes, factory kitchens and warehouses. "Objective conditions," the press insists, cannot explain away filth. Nothing is necessary but water and a will to be clean.

Dirt and mismanagement of cooperatives, the Soviets are beginning to discover, may hurt business and upset all their social schemes. The Dniesperstroi communal kitchen, for instance, is probably one of the best-equipped in the world. The most modern electric cooking and baking apparatus was imported from London at high expense, and a plan was drafted whereby all the thousands of workers' families would be relieved from maintaining their own kitchens and dining rooms. But the Dnieperstroi proletariat stays at home. A young laborer no sooner has a fine room in one of the new collective houses than he takes unto himself a wife who starts preparing his meals on their private range or primus. The reasons are plain: the Dnieperstroi kitchen, like hundreds of others throughout the country, is filled with flies and filth; the food is tastelessly prepared; the management is bureaucratic and takes little interest in quality (it

serves black bread, for example, when white loaves could be prepared at least several days a week); while the dining room is barrack-like, crowded, and noisy.

These things should change quickly after Stalin's magic word on the subject. Surprising changes have recently occurred in more complicated situations, after he took a hand. The obstacles, in this case, are not objective. An attractive menu and a pleasant restaurant are possible even with the limited means available. It is only difficult to understand why other men, closer to the individual scene and less pre-occupied than Stalin, should not have seen these things for themselves—and acted independently.

During Bernard Shaw's recent nine-day tour of the Soviet Union, he remarked that the Five-Year Plan for Economic Construction ought to be followed by a Five-Year Plan of Aesthetics. Both, of course, go hand in hand; the second is already here and would be impossible but for industrial progress. People who live in the skies may regret the grip which the machine has taken on Soviet imagination and Soviet life; yet without it, and without industrialization, the cultural advance that has been registered in recent years would have been precluded. Bathhouses and crèches in villages, universal compulsory education in elementary schools, the rapid elimination of adult illiteracy, the cleanliness of young children—before they grow "independent"—and the consequent reduction of infant mortality, modern living conveniences for the poorest of the population, and even this present campaign towards better sanitation would have been impossible, but for the potential of prosperity and actual material improvement introduced by the Bolshevik regime. The road, however, is still long.

"Anyway, our characters are not being ruined by the dole!"

If Germany Had Free Trade*

By KARL BRANDT

Berlin, August 7

GERMAN economic life received an entirely new aspect after the war. Its characteristic traits, successfully developed during a period lasting a full hundred years until the war, have mostly disappeared. The new type of post-war economy, which can be paralleled in many other countries, is distinguished by the fact that more and more private and governmental restraints have been worked into the original structure of free trade and marketing, so that the basic principle and theory of building up the nation's economic life as a free enterprise, oriented in the direction of privately controlled industry, can now only be recognized as a once rudimentary characteristic. The German economic policy of today is protectionist in and out and presents a 100 per cent opposite of free trade in its commercial politics. And at the same time, every natural, organic rhythm, which could influence supply, demand, and prices, is made impossible through planned intervention in the natural processes of trade.

If one compares the German economy with that of other countries, the restraints which the state has put upon the managers of business in relation to labor appears at first sight as an unquestionable advance in the development of the capitalistic system. Instead of a brutal fight for power and a primitive license to those who are economically weaker, both responsible parties, capital and labor, have been forced by the state to come to agreements which seek to protect the socially weaker party to the struggle, who may be temporarily dropped out of the industrial system, from impoverishment and ruin. If one, however, studies the functioning of the economic relationship of labor and capital thus socially restricted, the newest phase of its development must give rise to grave fears.

The working men took part in the war and at its close presented their bill for services rendered in the form of demands for wage rates to be guaranteed by the state. The working men asked, and received in every larger enterprise, the right to influence the development of the relations between the capitalist and the employees. The capitalist responded by fixing the agreed minimum wage schedule suggested by the laborers as the maximum limit for wages and salaries. Thus one of the most important elements of cost, namely the price of labor, became inflexible. At the same time regular payments in proportion to a worker's ability and efficiency were thereby made impossible for a large number of workers, especially the unskilled ones. However, the rigidity of the system was, for the skilled laborer, somewhat lessened by additional payments for ability and rewards for exceptional work. The standards of purely economic valuation of a worker's service were replaced, in the case of officials and office-workers, by social standards, namely length of service and age. The schedule of wages having thus been stabilized, any variations of wages, either up or down, must now be determined by each industry as a whole, in accord-

ance with economic conditions, because the normal variations of business cycles have been suspended by this fixation of the cost of labor. These conditions offer an additional inducement to capitalists to stabilize as well the price of their products. Trade groups, trusts, and price agreements reached through the agency of the government, are increasing rapidly. Gradually all prices for raw materials, and finally also for numerous finished products, will be determined by agreement. That which is being done for large enterprises by the trade associations, is being accomplished for the small operators in crafts and trades by the compulsory formation of guilds and their price agreements.

This fixing of production costs and their determination for a given period of time results in overthrowing the principle of a small profit per unit and large sales, and sets up, instead, the reverse principle, namely that of large profits per unit and small sales. Finally, in order really to fix and stabilize prices, we have turned to the old method of the protective tariff, toward which at the same time the vision of a strong self-contained economy—which spread like a disease all through Europe after the war—pointed the way.

But the tariffs and the fixed cartel-prices for the most important industrial products have naturally placed agriculture in a trying position. Governmental fixing of prices for industrial raw materials is logically followed by agricultural tariffs. Here we have the same conditions as in industry, namely tariffs to stabilize the raw material, i. e., the prices for grain. Thus simultaneously a stage of political economy is reached in which the separation of the home market from the world market is categorically demanded, the main purpose being the avoidance of all competition whatsoever with foreign countries. It is desired to create a monopoly in the home market and a schedule of prices which no longer bears any relation to foreign schedules. This utopian goal can, however, only be reached occasionally and with certain goods. Nevertheless, the method is successful in changing materially the relation of prices within an economic system thus fenced in by protective tariffs to the prices prevailing in the open world market. For instance, pig-iron in Germany is much higher in price than bar-iron in the world market, fertilizers cost two and one-half times as much, grain twice to three times as much, sugar three times, but eggs and milk only about just as much as in the neighboring states. These artificially created price-factors lead the whole economic life into entirely new, and, as will be shown, unsound and uneconomic policies. Also here, as in all other countries, the individual protective tariffs are claimed to be justified by the fact that important conditions in each industry or agriculture are represented as far more unfavorable at home than in foreign countries, and that fair and free competition is therefore impossible.

At the same time the state assumes entirely new functions. The state forces itself into the economic life in the role of a capitalist. Not only that, it organizes public utilities at its own risk, and it also takes its place as magnate in the production of raw materials and in finished production.

* The third of a series of articles on free trade. The fourth, on France and Free Trade, by Robert Dell, of Paris, will appear in our next issue.—
EDITOR THE NATION.

This new and active participation by the German state in the economic field causes one very extraordinary psychological result, that the state no longer concerns itself directly with the welfare of the working people in each industry, but charges itself with the welfare of the undertakings as such. The state dispenses its measures for relief and help wherever industrial or agricultural failures, losses or breakdowns occur, not for the benefit of the people directly affected thereby, but in order to keep the various businesses above water by granting them financial assistance.

This development of this politico-economic principle of government aid has had especially consequential results in the field of agriculture. Here, in order to insure prosperity for the agriculturists, the protective tariffs have been supplemented by all sorts of additional governmental regulations, such as those which prescribe certain compulsory usages of commodities; milling quotas; an import corn monopoly; and governmental warehousing, as well as denaturing, and sales of food stuffs at low prices for stock-feeding purposes. While in a free and unregulated economy, the creation of financial profits remains the task of the individual producer, the illusion now arises that the state can successfully solve the problem of prices and profits. The state's desire for profitable financial returns for the individual agrarian enterprise is replaced by the thought of "financial returns for agriculture as a unit." In this the fact is overlooked that among millions of individual enterprises there will always be some which, under given circumstances, are very successful, many others which are barely successful and finally still others which are failures. A governmental guarantee for the financial return in an entire branch of industry is based on the assumption that all the managers in it possess all the qualifications which justify a claim for success and profit.

The German government's policy of support for the land-owners of the East, who still politically and socially dominate the Reich, is given further impulse by the close connection between debtor and creditor. Moreover, the state, as a result of the period of inflation, has become the creditor of large enterprises which were losing money, either directly in its role as collector of taxes, or as grantor of distress credits, and indirectly through the credit transactions, on the basis of both real and personal property, entered into by its own banking institutions. In this way the state is heavily interested in the artificial revival of these bankrupt enterprises and in the thawing out of frozen credits. The same condition prevails in industry. The more the state becomes involved in it, the stronger becomes its objection to an about-face in economic policy. Our state, as capital creditor, is moreover endeavoring to stabilize the falling agrarian real estate values in East Prussia, and to ameliorate the necessary write-offs for losses, or to distribute them over a period of time.

Even before the war the German policy of a protective tariff for grain increased the growing of grain to an unhealthy degree at the cost of feed and the production of milk, butter, cheese, eggs, poultry, vegetables, and fruits. The consumption of these latter rose, however, so greatly in Germany, that the products of the free trade neighboring countries had to be imported in constantly growing volume. As a result this extensive business with its rapid turnover of capital was made more and more difficult for German growers, and at the same time the expansion of the growing of

grain, much less liquid in turnover, was stressed. Today a potential buying power of about two billions of marks is transferred annually to the growers of neighboring countries, while the high grain prices have not even resulted in a profitable return to the large grain growers. The effect of this system is that German bread is 100 per cent to 110 per cent more expensive, and at the same time considerably inferior in quality, than bread in the free trade neighboring countries.

This one-sided protective duty for grain in favor of the large agricultural enterprises which are predominantly unprofitable anyhow, serves also to keep artificially high the values of the farm lands used for growing grain for bread in Germany. On the other hand, the throttling of the importation of cheap feed-grains greatly increases the cost of raw materials of these German farmers, numbering about five millions, who predominantly cultivate animal products and the lesser vegetable crops. The cost of production in agriculture stagnates, and the peasant farmers, hitherto financially in sound condition, have gradually drifted into a depressed state, similar to that which prevails among the 18,000 gentlemen farmers, in favor of whom the protective duty for grain was established. Within a single year, aided by exorbitantly high duties on grain, an increase of 70 per cent in the planting of summer wheat was induced. Indeed, the entire wheat production has been increased to such an extent that, in addition to the high rates of duty, measures for the support of the wheat market are already being planned by the government, as in the United States. Naturally, the same purpose rules here as in the case of industry, namely to avoid the inevitable consequences of this overproduction policy, namely falling prices, which are, however, the logical cure for overproduction. Our government's policy in the rye market has been marked by a similarly absurd course. The final result was a terrific loss, without producing economic advantages. Instead, the result of the operation was that support for numerous other products was immediately demanded, and an equally disastrous operation was carried out with the potato crop.

In view of the fact, however, that Germany imports from foreign countries annually about one billion marks' worth of butter, cheese, eggs, and vegetables, in other words products of the small farmer, and that, furthermore, the duty on grain discourages the home production of these articles in favor of the growing of grain, there results, as has been said, a pronounced transfer of German purchasing power to the exporting countries, namely Denmark, Holland, Lettland, and Finland. This transfer is uneconomic and unsound because it artificially handicaps the production of those German farmers who are capable of meeting competition, and favors a different crop-production which is unable to meet competition. Germany produces about 500,000,000 marks' worth of eggs; the consumption per capita is increasing rapidly. Today Germany imports 300,000,000 marks' worth of eggs. The German producer of eggs is compelled to buy barley, corn, or wheat at 11-12 marks per 50 Kg.; in return he receives 6 pfennigs for an egg. The Dutch or Danish farmer uses for feed a free imported grain at a cost of 4.50 marks per 50 Kg. and receives likewise 6 pfennigs per egg. It is perfectly evident that the German producer of eggs is headed for ruin.

The effect of the system of high protective tariffs is best illustrated by the sugar industry in Germany. Until

1927 German sugar beets were protected by a relatively high sugar duty. The price of sugar was about 34 marks per 100 Kg. Still the beet-growers claimed to be in need of a higher tariff. Thereupon the government increased the duty on sugar to such an extent that the price rose to 42 marks per 100 Kg. The consequences of this step are so evident and simple that anybody could count them off on his fingers in advance. But let us follow the procedure further. The planting of sugar beets increased. The crop exceeded the demand so that large quantities had to be exported, with the result that in the home market the price of German sugar is 42 marks, in foreign markets 12-14 marks! During 1930-31 about 20 per cent of the German sugar crop was exported to the world market. Even larger amounts, for which no export market exists, have been stored for future use. The producing farmer no longer receives for his beets 1.80 marks as he did before the duty was advanced, but only 1.10 marks. The dumping of the surplus has been, however, too costly, and, therefore, it has been decided to choke off production by apportioning and limiting the conversion of beets into sugar. The result is that certain producers, namely the sugar refineries and large growers, enjoy the privilege, under a purely arbitrary ruling, of cultivating too expensive beets, while all others, especially the majority of the small farmers, go empty handed.

It must be kept in mind, however, that these small farmers can produce sugar beets much more cheaply because they have a surplus of working-power, have much manure and, if they own many cattle, have excellent use for the leaves of the beets. The working of the system outlined results in stabilization of the cost of production and any economic progress is checked. The home consumer pays the bill because if the home price is 300 per cent of the world market price he can afford only half as much sugar as the consumers in many other countries. Thus in spite of over-production, the demand is artificially kept at a low level. The self-evident way to adjust the amount of production to the market needs would be by the reduction of the sugar price through repeal of the tariff. These conditions produce an endless chain. The lesser evil is always chosen. From time to time it is discovered that despite the increase of the several duties there are still holes for foreign goods to slip through. To close them, more and higher tariff changes are made instead of our abandoning the wrong principle. How unhappily and contrary to all reason this manipulating of tariffs has affected the various prices is best shown by the fact that the only agrarian raw material which is still duty free, namely the concentrated feed stuffs, such as soy bean meal and oil cake with 50 per cent protein, cost half as much as grain. The protectionist system which rules in Germany today is economically indefensible because the vital factor of all business, namely the personal initiative of both employer and employee and free competition, is gradually being destroyed.

What can Germany gain from free trade? The answer to this question appears to require first of all a definition of free trade. Free trade does not imply a haphazard "laissez faire, laissez aller"; it can only mean an economy which stands in free competition with other nations, but is actively aided and promoted by its state along the lines of rational and free economic development. Such help on the part of the state should consist, for instance, of aiding in lowering the

costs of production instead of stabilization of prices, in the promotion of scientific training, and in spreading knowledge of the discoveries in technical progress.

The return to a modified free-trade policy—its prerequisites in relation to foreign policy cannot be discussed here—would produce as the first result ■ lowering of raw material prices, both in agriculture (*i. e.*, grain and vegetables) and in industry. A gradual reversal of our economic policy would not mean a financial loss in duties to the state, but the great revival of trade would assure both ■ considerably greater tax potentiality and greatly increased revenues from the remaining but decreasing duties. The greatest difficulty to be overcome when a change from protection to free trade is made is the first period after its adoption. This period requires nerves of steel for those who steer the political ship. It is inevitable that in such a change—even when plans for the transition period have been carefully laid—all that was artificially kept up under protection and cannot hold its own under the laws of competition gradually breaks down. This would apply in Germany principally to the large agricultural enterprises in the East, and also to numerous enterprises in heavy industry. Undoubtedly many peasant farmers, as well as factories and independent enterprises in light industry, would be seriously affected, because many of these parasites have been carried along during the period of protection by government aid and would be unable to stand on their own feet. The inevitably severe consequences from which many individuals would suffer during the period of transition and readjustment would make it imperative to proceed with utmost consideration. But Germany could look forward to a healthy, self-reliant, and enterprising economic life after the adoption of free trade (after the difficulties of the change have been overcome).

There are excellent precedents available for reliable knowledge as to the difficulties and the consequences of ■ transition from protection to free trade. Several decades ago Denmark and Belgium carried out such ■ reversal of policy. The crisis was grave in both countries, but both countries show today ■ weatherproof economic structure. Nowhere else have individual price calculations so thoroughly become the foundation of industrial and agricultural life, nowhere else are production costs lower. Still another example can be cited from recent times. In that part of Schleswig-Holstein, which was ceded to Denmark, the peasant farmers have had to adopt a far reaching change from protective duties to free trade. They adjusted themselves excellently to the new conditions and are today in ■ much sounder position than the protected German farmers.

The existing tremendous economic crisis in Germany, which—in spite of all our Government's wrongly conceived economic measures—is in the last analysis due to the impossible and dictatorial demands of the Treaty of Versailles, has imposed upon our state the most difficult task ever faced by any government. Every beam and every plank of the Ship of State groans as in a hurricane. Faith in the vitality and possibility of the capitalistic system of national life has already been shattered in a large part of the population during the terrible years of the crisis, because only a shadow of that system has remained. But as soon as the worst consequences of the financial crisis and the loss of confidence have been overcome, a gradual change to healthier and wiser economic policies will surely be forced upon us.

A Letter to Critics

By SINCLAIR LEWIS

Barnard, Vt., August 22

IN my innocence I had supposed that reviewers for *The Nation*, unlike contributors to less scrupulous publications, were expected at least to glance at books they reviewed. But I seem to have been in error. In *The Nation* of August 19, in a comment on "Vermonters: A Book of Biographies," one of the interesting volumes just issued under the influence of the Vermont Commission on Country Life, I find these extraordinary words by Eda Lou Walton:

The "Biographies" will prove more interesting to Vermonters than to the general reader. Only a few famous names are included: the inevitable Calvin Coolidge, and Robert Frost, of course. The most interesting and illuminating material is to be found in the biographies of such pioneers as Ethan Allen and Walter H. Crockett. Here is vivid history.

Vivid is the word. In fact, vivid is always a good vivid word, in reviews. But Mr. Crockett hasn't really been a pioneer in the same sense as Ethan Allen, who died in 1789, for Mr. Crockett was not born till 1870, and is today a professor in the University of Vermont. There is no biography of him in the book, though there are several by him.

The Nation's reviewer may have slipped; she may have meant some one other than Walter Crockett—perhaps Davy. But view her former statement, her implication, intentional or unintentional, that only the names of Coolidge and Frost are known outside our parish. What about the following persons, born or for most of their lives resident in Vermont, and all of them discussed, plain for any one save a reviewer to behold, in precisely this book reviewed:

Chester Alan Arthur, President of the United States. Admiral Clark, a hill-town boy who became the hero of the *Oregon's* great voyage. John Cotton Dana, prince of librarians. Thomas Davenport, who with only a poor blacksmith shop for laboratory, made the first electric motor in history, the first motor-driven car, and the first model of an electric trolley, and who ran the first electric printing press.

Or Professor John Dewey, Admiral George Dewey, and Captain Ira Dutton, U. S. A., who was to become the glorious "Brother Joseph" of the Molokai Leper Colony, and to die this year, at eighty-eight, after forty-five years of quiet heroism. If Miss Walton has never heard of the two Deweys nor been stirred by the romance of Brother Joseph, yet perhaps she has read of a man called Stephen A. Douglas, who argued a good deal with Lincoln. If she had looked into the book, she would have seen that the little giant of the prairies was born in a cottage at Brandon, Vermont.

And what about Thaddeus Fairbanks, who invented and first manufactured the platform scale, a prosaic but most important factor in distribution? And Dorothy Canfield Fisher? And the reverend and scholarly Rufus Griswold, the elegant anthologist, who so zealously spread the news that Poe was a drunkard that, thanks to Griswold alone, Poe was in disgrace for seventy-five years? And the Ambassador and Editor and King-maker, George B. M. Harvey; Houghton, publisher of Lowell, Holmes, Longfellow, Em-

erson, and the *Atlantic Monthly*; William Morris Hunt, the American Barbizon painter who put over Millet? And Darwin P. Kingsley, Hiram Powers the sculptor, and Redfield Proctor, Senator and Secretary of War, who built up the largest marble business in the world and, just for variety, created the modern American army?

And may the world not have heard of John Godfrey Saxe, Stuart Sherman—another plainsman who was actually of the mountains—or of Justice Wendell Phillips Stafford? Should not even a reviewer recognize the name of Thaddeus Stevens, who was nothing much but the storm-center of Washington after Lincoln's death, the man who almost had President Johnson impeached and almost drove the South back into war again? Well, he was born in poverty on the Vermont frontier.

What about Theodore N. Vail, first president of the American Telephone and Telegraph Company who, though he was born in Ohio, at the age of thirty-eight bought a farm in Vermont and thereafter, whenever he travelled abroad, registered himself as "farmer, Lyndon, Vt., U. S. A." And Dan Willard, the lone knight among railroad presidents, and the other Willard, Emma, who in her own house in Middlebury, Vermont, opened a Female Seminary in 1814, and who became the greatest pioneer of women's education in America.

My dear Miss Walton! "Only a few famous names are included."

I should have thought that a writer for a magazine with the purposes of *The Nation* would have had sense enough to see that here was, ready-made, an extraordinary study of the effect on character of living amid a sturdy and not overcrowded folk.

Such a roll of great men might not be extraordinary in states with such huge populations as New York, Pennsylvania, Ohio, Illinois—yes, or Virginia which, though now it ranks only twentieth in population in the United States, was from first to fifth between 1790 and 1850. But Vermont, now ranking forty-fifth, has never—never—had more than 360,000 people, which makes it only slightly greater in population than that not very distinguished community, Jersey City, N. J., considerably smaller than Newark or Seattle, and about one-half as large as Pittsburgh, whence cometh only Mellons and the pious Jim Davis.

Nor has Vermont, like all the Atlantic States south of it, any long history in which to have produced heroes. Not until 1760, two hundred years after the foundation of St. Augustine, Florida, did it have permanent settlements. It has always been of a scattered population, with little wealth and no vast influential centers. Even today, the largest town in the State, Burlington, has but 25,000 residents.

Yet out of this population, so small that it could be lost in the Bronx, out of these homogenous hills and meadows which might be expected to have produced only one sort or two of man, have come such amazingly contrasted persons as Coolidge, Rufus Griswold, Father Joseph, George Dewey, George Harvey, Stephen Douglas, Stuart Sherman, the fas-

tidious, and Hiram Powers, the prince of plaster!

Was this not worth some consideration by the reviewer supposedly qualified to represent *The Nation*? I should not expect her to produce so long an essay on Vermont and the advantages of disurbanization as this; but I should have expected her to see and hint that it was splendidly there.

Incidentally she did not mention, if she ever noted, the one important adverse criticism of the book: that it omits two of the most interestingly notorious men ever born in Vermont—Joseph Smith and Brigham Young.

Is this not news—not, perhaps, for a New York tabloid, but for such an audience as that of *The Nation*? A State, not rich, not boosting and peppy, has made an effort to understand itself better by collecting and recording its own history, with no help whatever from outside millionaire "Foundations." Does that news not deserve a slightly livelier comment than the reviewer's vague and supercilious remark—presumably about the two volumes in the series devoted to Vermont Prose and Vermont Verse: "Such a project is worth while as social history and as a background for the social criticism of literature, but writings so collected are likely to prove of very little artistic merit"? Well! I don't suppose that Dr. Peach, the editor of the series, ever thought of it, but now that Miss Walton points it out, he probably realizes that the collected literature from any one small state

is unlikely in general to reach the standard of "The Oxford Book of Verse." That's news! That's illuminating! That's vivid! And of course in a world that, in 1931, is entirely devoted to artistic merit, any "project" that is merely sound social history is scarcely worth trying!

Again incidentally, while Miss Walton did credit the publication of these books to the Stephen Daye Press, Brattleboro, she did not take the trouble to give the name of the series. These four books, of Vermont prose, verse, old folk songs, and biographies, are published together as "The Green Mountain Series."

And, not quite so incidentally, it has interested me to study, in a case in which I have no responsibility for the book and in which I know nothing about the reviewer, a typical case of incompetent reviewing. A writer gives years to a sound book; a reviewer, even in so consequent a journal as *The Nation*, not infrequently disposes of it without taking the trouble even to look at it. Every writer suffers from this, daily. Regarding his own work he does not, unless he is an Upton Sinclair, leap on a soap box and rage publicly. But that does not keep him from secretly wishing that every person who takes upon himself the considerable responsibility of judging a book would occasionally come to the courtroom and hear a little of the testimony before he pompously charges the jury.

We Haven't Saved a Cent

By LAURA TURNIDGE STEVENS

IT appears that the working people of the United States are profoundly misunderstood or else misjudged by their more fortunate fellow-citizens. Recently the unemployed of a certain Northwestern city which calls itself the lumber capital of the world marched many thousand strong to the City Hall, where they appealed to the mayor and other officials for relief. The next day a millionaire factory owner, in speaking of this demonstration to a group of his employees, referred to the protesting men as "the criminals who marched through our streets yesterday." I heard a high-school teacher say of the marching men that "half the number would refuse a job if it were offered." He added: "They were looking for work and praying that they would not find it." Although the demonstration had been carried on in perfect order, a prominent business man spoke of the parading men as "the bums who tried to disturb the peace of our city."

A lady, prominent in social affairs, had occasion to drive through that portion of the city which is given over to the labor market. She was surprised by the large number of idle men she saw standing about in the street. Later, in a speech before her club, this woman declared that the city was overrun with hobos. It was suggested to her that most of the idle men she had seen were laborers who had been thrown out of work by the closing down of our own mills and factories. She refused to accept this explanation, and continued to speak of the men as hobos.

Shortly after the demonstration at the City Hall which I have described, several hundred of our most prominent citizens were called into counsel by the mayor for the pur-

pose of forming some plan of relief for the unemployed. They met at the best hotel in the city and there, seated about a banquet, our "wise men" discussed the problems confronting the lean, jobless individuals who had marched to the City Hall a few days before. Outside the hotel a mob of undernourished, angry men awaited their decision. Hours passed, and at last some of the unemployed men began protesting. Two of them secured elevated positions and begun haranguing the crowd. They were promptly seized, clubbed without mercy by the police, and marched to jail. I am only an ordinary woman, the wife of a day laborer, but even so I see clearly that the men who sat in counsel with the mayor forming plans, while partaking of a banquet, for the relief of the starving did not understand the reactions of the mob outside the hotel to this situation, or else they misjudged them.

Many refuse to face the truth about conditions arising out of the present financial depression, because it makes them uncomfortable to do so. The mental picture of the hungry man who begged for food at the back door may spoil her dinner for the wife of the shut-down factory owner. She would like to think that it is the man's own fault that he is hungry. Prosperous persons who are constantly solicited for funds to provide for the needy, build up in their minds good reasons for not giving. They tell themselves that if great hordes of working people are in such unhappy circumstances, it must have come about through failure on their part to make the best of their opportunities.

The opinions voiced by Mrs. Davids, an ex-missionary, who lives near me, correspond with the average opinion, the

way of thinking which characterizes the general indifferent public. I refer to that portion of the public which, comfortable and unaware, is fairly secure in its own resources and heartily wishes to remain so. I talked with Mrs. Davids as we waited for the street car. "I doubt that very many people are out of work," she said in answer to a remark of mine. "Yes, I know that a large number in this neighborhood are laid off, but sometimes I think they want to be laid off. They don't seem to worry about it. The truck driver who lives next door to me has been out of a job for a month, but I heard him whistling this morning as he chopped wood. He seemed to be perfectly happy. I can't believe that people in this country are actually going without sufficient food because they are out of work. I was at a moving-picture show yesterday and the theater was crowded. This leads me to think that times are not so bad. And our minister says that only a small percentage of the working people are unemployed—and he ought to know."

I suggested that even a small percentage of a large number might be a great army, but Mrs. Davids did not answer me. She continued: "I have not much sympathy for working people even if they are in want. They are an extravagant lot. Even now, when they are supposed to be in such straits, they spend money foolishly. A welfare worker told me a story . . ." She repeated the oft-told tale of the machinist's family that had been on charity for several months; how a relative, hearing of their plight, sent them two hundred dollars.

"And what did they do? You never could guess," said Mrs. Davids.

I had heard what the machinist's family did, but I would not deny my neighbor the pleasure of telling me.

"The day the money came," she said impressively, "they had stewed chicken for dinner, and went to a matinee! There can be no doubt that working people are an extravagant lot. The majority of them could have had homes paid for, and money saved, had they but lived economically since the war. Work has been plentiful most of the time and wages good. It's their own fault if they are hard up."

The assumption that if laboring people had only managed well in these last years they might have homes paid for and huge indestructible bank accounts to draw upon in time of unemployment, is the stupidest and more irritating of all the excuses given by those persons too weak to face the issue. And it is used most frequently by those who wish to shirk their responsibility in helping to solve the problem of relief for the unemployed. "Working people have lived too high!" We hear it said on every side. "They have bought too many automobiles, too many electric washing machines, too much fine furniture on the installment plan. They have attended too many moving-picture shows." Persons who utter these sentiments misunderstand the class they talk about. Their information on the subject is incomplete.

Two-thirds of the men on our street are out of work because the saw-mills and factories are shut down. My husband may be one of them tomorrow. We are one of those thriftless families who, upon an income of something less than eleven hundred dollars a year for the support of three people, have been unable to save money. Next month we may not have money to pay for food and fuel, to make the payments on our home. We may not be able to pay our

daughter's street-car fare to school, our son's carfare as he makes the rounds of the city looking for work. (Our son's home has been broken up these last six months because he has been, through unemployment, unable to support his family. His wife and child have gone to stay with relatives in the country, and he is to remain with us until he finds work.)

I suppose it is hard for people who have lived all their lives in financial security to understand such a situation. But that does not prevent its existence in millions of American homes today. And the majority of these homes are not the squalid dwellings of "ignorant foreigners, who have never maintained a decent standard of living," as many of the more fortunate class would like to think. These conditions—and worse—exist in good American homes where people sleep between clean sheets and children are taught to brush their teeth before going to school in the morning. Mothers who have learned by reading the *Woman's Home Companion* and attending Parent-Teachers' Association meetings that children must have large quantities of milk daily if they are to develop properly are being denied any milk at all, because the Welfare Bureau cannot obtain funds to pay for it. In our city last week two hundred families were deprived of milk for this reason.

And even now, you who read this, if you are one of the sidesteppers of the issue, are saying to yourself: "The woman is writing about laborers on the lowest round of the ladder. I am sure that not many skilled laborers are so badly off." If you have had occasion to employ a brick mason, a plumber, or an electrician in recent years you will recall that you paid him what seemed to you an unreasonably large wage, and you will decide that labor of this class cannot be on charity.

My neighbor, Nels Jensen, who earns his living by building chimneys, is a fair sample of the skilled workingman. When I first knew him eight years ago, he was earning eight dollars a day, but his work was not steady. He averaged less than forty dollars a week. As time passed he earned less, and in the last three years he considers himself lucky when he earns twenty-five dollars a week. There have been too many brick masons and not enough jobs, and wages have dropped to six dollars a day in defiance of the union. Between jobs Nels works about his place, repairing his buildings or digging in the garden. Much time he spends looking for work.

I think the Jensens have spent their income wisely since I have known them. Nels's earnings have averaged \$1,400 a year. They have lived decently. They have paid \$2,300 for a home. They have purchased a Ford car for Nels to ride to work in. Life insurance costs them \$150 a year. Six hundred dollars have been spent in eight years for doctors' and dentists' bills. The birth of a child cost them \$200, an operation for Nels \$200 again, and at the insistence of the school nurse each of the three children has had his tonsils removed, at a cost of \$40 a child. The Jensens have saved no money, but they have kept clear of debt. I believe they are justified in being proud of their financial management since I have known them.

Nels Jensen represents the average in skilled labor, and he has managed his affairs with care and intelligence; but still, at the end of three months of unemployment, he and his family are living on charity. Considering the working class in general, the skilled worker earning above \$1,400 a year

is greatly in the minority. For each one of this kind there are twenty unskilled laborers earning not more than \$1,000 a year.

To deny the situation that exists and to declare that working people are on charity because of past extravagance is stupidity. Things are in a bad way with the working class in the United States, and it would show wisdom on the part of members of the ruling class if they would but look at the situation from all angles, appraising it with careful judgment. I am an American citizen who believes that government under our Constitution, if honestly administered, is the best there is. Most of the working people I know are of the same mind, but they have lost their sense of national security. They see the spirit behind such manifestations of callous indifference and misunderstanding of the truth as I have described in the beginning of this article.

In the Driftway

THE other day the Drifter, suddenly deciding to flee from the heat of New York and get himself into a bathing suit, paid his first visit to Jones Beach, and encountered there one of the pleasantest surprises of his life. For the Drifter arrived at Jones Beach with a fixed idea of what any beach within an hour or two's drive of New York City would be like. It would be like Long Beach or Coney Island. That is, there would be rows of ramshackle wooden bathhouses, which in an emergency would make excellent fire traps; they would be properly dark and dank; those who managed them would charge you anywhere from \$1 to \$2 or \$3 for the privilege of changing from your street clothes into a bathing suit; the bathhouse entrances and sides would be covered with various garish signs, giving either the name of the bathhouse or advertising some cigarette or soft drink or sunburn lotion; while between competing bathhouses there would be rows of hot-dog and soda-pop stands, shooting-galleries, Japanese ball-rolling games—all covered with flamboyant placards and full of noisy "barkers."

* * * *

THE Drifter's first surprise came as his car (or, if he must be honest, his friend's car) approached the beach by way of Southern State Parkway. We went for miles without seeing an advertising signboard; we were completely deprived of the information that a certain cigarette satisfies, that another is toasted, that a third keeps you kissable, and that each of five brands of gasoline is positively the best. We passed only two gas stations, both charmingly designed, and without any messy signs announcing the price per gallon. Instead of telegraph poles, dirt, and hot-dog stands along the way, there was a continuous prospect of trees and grass and sloping lawns on either side; instead of meeting the parkway at dangerous crossings, roads at right angles passed over it on attractive stone bridges. Arrived at Jones Beach itself, our eyes were first caught by the fine water tower. We found that we could get a bathhouse locker for only thirty-five cents. The bathhouses themselves had actually been designed by a competent architect; their entrances were solidly built, in a uniform style, of admirably blended rough stone and brick, and the section for the bathers was built

of some solid fireproof material. Later we had dinner, at a moderate rate, in the dining room facing the sea, and watched the bathers and the colored lights of the beautiful outdoor pool. And surrounding the bathing houses, instead of the various hot-dog stands, advertising signs, and petty profiteers, were well-kept lawns, hedges, and flowers. The beach was almost immaculately clean. In brief, the whole thing seemed almost a bit unreal.

* * * *

SO this was State Socialism, showing its horrid head! This was the sort of thing against which the Drifter's generation had been warned so often in its youth, the thing which Mr. Hoover and all the champions of individualism are still trying to save us from! This was an example of that terrible Socialism which, practiced since the war on a larger scale in Germany, in town planning projects and the like, is supposed to have been so ruinous. Alas, Jones Beach does not reflect the glories of Free Enterprise, and Laissez-Faire, like the bathhouses of Coney Island and Long Beach, for Jones Beach State Park, and the Southern State Parkway, were built and are managed by New York State, through a commission.

* * * *

IT may be, of course, that the Drifter Sees Only the Surface of Things. Defenders of private enterprise may hint of graft; maybe this thing or that cost more than it should have. The Drifter has not looked up the figures; perhaps the beach—though he doubts it—is being run at a deficit, or won't pay a Fair Return on the capital put into it. But even if some of these things should turn out to be true, the Drifter cannot see that they would very much matter. For him those trees and flowers at Jones Beach were a more convincing and certainly a more delightful argument for Socialism, for Welfare vs. Profits, than anything in the works of the Messrs. Marx and Engels. Here, concretely, were the fruits of genuine planning. But then, the Drifter warns his readers that he is an Impressionist, and not a Close Reasoner.

THE DRIFTER

Correspondence

Dr. Mayo and War

TO THE EDITOR OF THE NATION:

SIR: Dr. Charles H. Mayo, speaking at the State convention of the American Legion, which met at Rochester, Minn., last week, told the ex-service men that the only way to deal with war is to prepare for it.

He said, in defense of his contention, that men have "predatory instincts," the implication being that men are born fighters, a doubtful proposition in view of the high-pressure methods which propagandists are compelled to use before men can be induced to fight; that "man's heritage is and always has been war," and that "there is no such thing as permanent peace between peoples," which is so simply because people are as indifferent about stopping war as Dr. Mayo. In fact the tenor of his address was that war is something we cannot escape, and that we might just as well put our house in order for the next one.

But the Mayos are not sitting around in their Rochester clinic lamenting the fact that cancer, being another human heritage, is an incurable disease. Not at all: they are up and doing. They are determined to rid the race of its cancer plague. But all this fine spirit of conquest forsakes the doctor when he steps from his office; and he assumes an attitude of *laissez faire*, forgetting apparently that if doctors had adopted that attitude in their own profession they would still be using herbs.

When the surgeon removes an appendix he does it with the utmost scientific skill. But in treating this dread "bellicosis," a disease of the body politic, he prescribes a measure of patriotism in a solution of bullets and gunpowder with instructions to increase the dose until it kills the patient, a remedy which quacks have applied for the last five or six centuries. It is strange that a doctor, who scoffs at fake cures and humbugs in the medical field, believes the most fantastic superstitions when he goes outside his chosen profession, and swallows the medicaments of Lydia Pinkham with a gullibility which is positively amazing.

WALLACE HALLIDAY

Our Free Trade Series

TO THE EDITOR OF THE NATION:

SIR: I must write you my congratulations upon the series on free trade just begun by *The Nation*. I think that protection is one of the chief causes of the division of the Democratic vote in Presidential elections. I feel strongly that the world must come to an understanding of the folly, as well as of the wickedness, of the protective tariff, and I am heartily glad that my friend Philip Snowden stands up with a rigid spine on that question. Alas, from this point of view I feel that the probable outcome of the new British Government will be disheartening and will delay sound economic progress.

Saratoga Springs, August 28 GEORGE FOSTER PEABODY

Contributors to This IssueHENDRIK WILLEM VAN LOON, author, satirist, and cartoonist, is writing regularly for *The Nation*.LOUIS FISCHER, Moscow correspondent of *The Nation*, is the author of "Why Recognize Russia?"

The Captive

By EVAN SHIPMAN

Hammers beat ring beat
To no avail
Only the shock of heat
To meet
And force the links of the chain
Shall prevail
Against the order of the bonds again.

Bound to the corded brain
The iron eats
And enters matching grain with grain.
The pulse beats
Heavy, where the temple's load pulses
Alike, beats
Scarlet, where the blinded eye convulses.

Freedom to turn the pain
(How frail
The scales of bondage) pain
Is stale
In the core, though the weight
Shall remain
Attending the slow fire of fate.

Conversational Communist

The Colonel's Daughter. By Richard Aldington. Doubleday, Doran and Company. \$2.50.

ALDINGTON is one of the most amusingly representative men of his generation. A writer of real skill, energy, and personality, he somehow, early in his career, got himself bogged in the delicate morass of a third-rate poetic movement and threw in his lot with the aesthetes whom now he so heartily belabors. Up to the time of the Armistice there was little indication that he had ever done any thinking beyond the confines of strictly literary problems. He was a perfect upper middle-class Imperial product, aesthetic model. Then came the famous war which was almost lost on the playing-fields of Eton; and Aldington, in common with many other young men of his class and generation, found that life was not exactly a sporting proposition. His first discovery of the fact was expressed in "Death of a Hero," a badly written but thoroughly interesting realistic novel, in which the blame for the war was placed squarely on the shoulders of the conservative ruling classes. Now comes this second novel, much lighter in tone and less impressive in every way, except one: it reveals the sheer intellectual progress the author has made in the last two years. He now reveals himself as a conversational Communist—a type found profusely among our own intellectual class. It is a far journey from Meleager and Anyte of Tegea to the caustic neo-Communist epilogue which closes "The Colonel's Daughter." It is a journey that the more socially responsible members of his generation all appear to be making—except those who, like Eliot, feel that, because they are great writers (which Eliot is) they must necessarily behave as if in anticipation of a Westminster Abbey interment.

"The Colonel's Daughter" is really a study, hastily, crudely,

but interestingly done, of a decaying economic class. Lieutenant-Colonel Frederic Smithers ("the old-fashioned, well-bred English gentleman, a little gone at the teeth, a little bare and bony at the occiput, keeping his pure cricket bags unsullied in spite of his woundy panic"); his horse-faced wife, whose Amazonian mentality is rock-proof against even the slightest suggestion of an idea; their unfortunate daughter Georgie, weak in the head and with buck teeth; Purfleet, the airy and sentimental intellectual; Geoffrey Hunter-Payne, the young red-faced Empire Builder; Margy Stuart, the post-war flapper who has found temporary salvation in changing beds: these are all seen, not as complex individuals (because they aren't complex), but as assignable products of a given social order which Aldington hates violently because it has betrayed him. The book is, of course, riotous caricature, with no pretensions to fundamental criticism and still less to perfection of form and style—but it is caricature done with the eye on the object. It is violent with all the naive indignation of the recent convert—and particularly of the convert who is turning against his own class. But its violence is genuine, not mechanical.

To Aldington, Imperial England's number is up. The stately homes stand in the shadow of imminent nationalization. The green and pleasant land is to change into something very remote from William Blake's New Jerusalem. "The turn is coming"—and, as far as one can read between the lines, this erstwhile imagist will not be at all sorry when it comes. Aldington's point of view, though it is born of the same war-weariness, must not be confused with the cynic despair of Aldous Huxley; for it is healthier, more vital, more constructive. It is virginal, intensely personal; he is still, even in this book which seemingly centers in the unhappy fate of an unattractive woman, paying off personal grudges. It will be interesting—he is a young man—to watch whether the note of social satire deepens as he gets older, or whether he will make a gesture of fatigue and return to the world of belles lettres. He has none of the characteristics of a really important novelist—but he is an extremely vigorous one, and, from the point of view of Moscow, he may well develop into an extremely valuable one.

CLIFTON FADIMAN

A Great Naturalist

Cope: Master Naturalist. By Henry Fairfield Osborn, with the cooperation of Helen Ann Warren. Princeton University Press. \$5.

EDWARD DRINKER COPE is one of the great figures of American science. Born in 1840, dying in 1897, he was among the last of the all-round naturalists: Leidy and Haeckel alone survived him. In a relatively short life he found time to be farmer, teacher, herpetologist, ichthyologist, editor, and paleontologist—and to make excursions into sociology, ethics, and philosophy as well. His complete bibliography fills one hundred and forty-five pages, and among its titles are many of the enduring classics of vertebrate zoology and paleontology.

Such achievement justifies biography, and this is at least the third to be published. Happily, it shows Cope as a man as well as a worker. That it does so primarily by quotation from Cope's own letters gives reliability and vivid reality to the portrayal.

The first of these letters was written in 1846, when the future scientist was but six years old. In quaint, Quakerish phrases he describes a visit to Peale's Museum (one of the sights of Philadelphia), where he "saw Mammoth and Hydrarchas, does thee know what that is? It is a great skeleton of a

serpent." The interest in animals is strong, and appears in both a journal of a voyage to Boston, and one of a day in the growing museum of the Academy of Natural Sciences of Philadelphia. The latter is a remarkable production for a child of eight, for it shows close study of both specimens and labels.

Except for a brief attempt at farming, urged upon him by his father, Cope moved directly toward a career in science. At the age of twenty-two he was in Washington, freely studying the Smithsonian collections. The next year he was in Europe; 1871 found him discovering the magnificent fossil reptiles of Kansas. His life became a mad whirl of exploration, study, writing, and lecturing. Figures, of course, are not too significant: yet we find that he described 1282 genera and species of fossils, plus an unknown number of living animals.

One thinks of the research man as cool, aloof, unhurried. None of those adjectives fitted Cope. Always he worked at high pressure, even telegraphing descriptions from the field to forestall his rival, Marsh of Yale. When no museum or bureau could pay his expenses, Cope spent \$50,000 of his own money collecting fossils, and speculated in mines to retrieve his fortunes. The speculation failed; he plunged into a newspaper quarrel with Marsh and the United States Geological Survey which nearly cost him his professorship at Pennsylvania. But the professorship was saved—and Cope borrowed money from his foremost champion to meet the bills of his embarrassed magazine.

A stirring, conflict-laden life. A life of nervous, exacting haste. Cope was old and tiring at fifty. At fifty-seven, he died. His death marked the end of an epoch in American paleontology. It was an epoch of pioneer exploration, in the wild haunts of scarcely subdued Indians. That exploration was carried out by individuals and conflicting official surveys: each party worked for itself alone and helped the devil to take the hindmost. In such cut-throat field work, with its attendant high-pressure study, Cope was a ready and able fighter.

Yet he was not, as tradition sometimes paints him, a bitter, humorless man, without capacity for prolonged reflection. He quarreled because he could not do otherwise; he worked fast because he had to. But these letters show that in spirit he remained the earnest, honest Quaker, doing good unto all who were willing to let him. In evolution, where haste was not needed, Cope's theories evidence a care in thought which makes him the most significant and subtle of all Lamarckians. As for humor—what must one grant this paleontologist who, disregarding all nomenclatorial dicta, commemorated a quarrel by naming an extinct, ugly beast *cophater*?

CARROLL LANE FENTON

The Lost Land Recovered

Social Substance of Religion. By Gerald Heard. Harcourt, Brace and Company. \$3.50.

THIS is a remarkable book. It is with difficulty that I restrain myself from calling it a work of genius—to do so would not be to debase the coinage of praise—and only a certain slightness in its structure holds me back. Mr. Heard starts from the profound unhappiness of man in this present age, manifested subjectively in the prevalence of neuroses, objectively in the pressure towards revolution. Mr. Heard's thesis—I am not satisfied that it is no more than description, but it must be confessed that there is no little warrant in this decade for calling it such—requires the painting of the world with almost Spenglerian gloom. He then proceeds to inquire after the cause of this unhappiness. On anthropological grounds he rejects the Freudian explanation of the inner conflict in the kingdom of man's soul. He finds the cause (partly

basing himself on Köhler's studies of apes) in a clash between the desire of the individual for identification with the group and for identification with the family. Either could give peace but the martyrdom of man begins with the rival claims of the two. Out of this rivalry the self-consciousness of the individual is born and the poison of the fruit of the tree of knowledge begins to work. Mere understanding replaces the early intuition and the sense of rhythmic union with the whole. The ritual of rhythm, in the religious dance and ceremony, becomes formal and empty. Behind the soul that has crossed the *limen* and gone out the cliffs rise ever higher and more dissevering between the kingdom of the conscious and the great lost land of the unconscious from which still flow the streams which water life.

Stage succeeds stage as we move away from paradise towards the shivering isolation of the self-conscious individual. Identification with the mother and matriarchy is succeeded by the aggressive temper of patriarchy, with its Oedipus savage energy. Exhausted, civilization turns back to the earth mother and the chthonic deities. The old unselfconscious sense of identity, however, has been lost. Deliberate orgiastic ceremonies to procure identification replace it. The erotic religions, however, are vitiated by the restless devil of individualism, pander only to the satisfaction of the individual—and leave him dissatisfied. The reaction to asceticism follows, including ascetic Christianity. So Mr. Heard follows up the course of the history of religion as man's attempt to recover the lost happiness down to the last attempts of Quaker and Moravian to recapture identity with the group. Meanwhile—and it is here that Mr. Heard is least speculative in his argument and most brilliantly convincing—the group has grown into the state, has become external, heterogeneous, mechanical, utterly unable to satisfy the psychic demand of the lost individual for that sense of union which the animal group once gave and the ritual of religion maintained. The quest of man is for the recovery of that sense.

Havelock Ellis, in a recent review of the English edition of this book, points out that many men have entered into a community saying, "Fellowship is heaven," and have left it, disillusioned, saying, "Fellowship is hell." Mr. Ellis, without perhaps falling into the old individualist error of imagining that man is a psychological Robinson Crusoe, has never had much use for the morals of the community. And yet one wonders whether Mr. Ellis and Mr. Heard do not really affirm the value of the same experience. Havelock Ellis sees the importance of the exclusive selection of friends and the tension of this group in its relation to the outside world. Gerald Heard affirms the all-importance of the like-minded group of friends, integrated in contrast to a heterogeneous and unsatisfying society such as a state or nation.

In his dissatisfaction with the understanding as man's guide to happiness Mr. Heard is only following the tradition of Bergson. For his psychological and anthropological presuppositions he will have to stand before the bar of the experts in these sciences. The novelty of the book lies in its attitude towards the like-minded group. Mr. Heard will have to answer the criticism that he is advocating a form of infantilism, of what in the jargon of the subject is called "return to the womb," whereas, as Lippmann has pointed out, a sound philosophy requires man to face realistically the consequences of maturity. Mr. Heard may reply that such philosophy may taste the knowledge of truth but—such is the primal curse—cannot give happiness. He has to answer in the affirmative the question "Is society a good thing?"—a question put by doubters, not in the style of Thoreau, but more profoundly. After all, is the good of society to be found in identification with it, or also to be found in our experience of it in its tensions and hates as well as in its unions and loves? Fundamentally, however, Mr. Heard's problem remains well posed. Can man be satisfied by state or

nation? How nearly did primitive group and primitive family, Aristotle's city-state ("to be seen all at a glance": face-to-face) and monastic community satisfy? Must not some such spiritually homogeneous group be rediscovered today unless man is to violate his deepest nature and civilization to end in catastrophe? His method of posing the question and of arguing towards an answer raises Mr. Heard's book to the level of being what, in a world of ballyhoo, I shall not scruple to call one of the eminent writings of today. It needs verification. But it is discovery.

GEORGE E. G. CATLIN

Pattern of Mexico

Mexican Maze. By Carleton Beals. With Illustrations by Diego Rivera. J. B. Lippincott Company. \$3.

NO American writer knows Mexico more intimately than does Carleton Beals. None understands it better. His "Mexico: An Interpretation," published in the spring of 1923, was the first book in English to make intelligible the revolution begun thirteen years before. His "Brimstone and Chili," a personal chronicle of high adventure, gives a swift panorama of Mexican life from the burning Sonora Desert, over the icy plateau of the Durango Sierra Madre and into the vortex of revolutionary life in the capital during the Carranza administration.

Now "Mexican Maze" completes a trilogy. Described as "leaves from a notebook of fifteen years of peace, war, and revolution in Mexico," it packs into some 350 eloquent pages the vast material—exposition, description, anecdote, and shrewd comment—resulting from Beals's varied contacts and experiences.

The format is singularly appropriate. Printed on buff stock, suggestive of the maize husks which, as tamale coverings, cigarette "paper," and market bags, are so characteristic of indigenous Mexico, and profusely illustrated by Diego Rivera, the whole book is redolent of Mexican atmosphere.

Appropriate, too, is the literary structure—a series of vignettes. For Mexico, unlike our own country, is not homogeneous. Its villages, its people, are not stereotypes. No rule may easily be deduced from one or even several examples. Mr. Beals's technique of allowing each episode, each cliché to speak for itself, is particularly happy.

Those who know Mexico will appreciate the poetic license which occasionally invades "Mexican Maze." Thus Don José Avellaneda, revolutionary leader, in the chapter "The Unburied Patriot," is a composite of Luis N. Morones, Mexican Federation of Labor chief and Secretary of Commerce and Labor in the Calles Cabinet, and of Luis León, Secretary of Agriculture in the same cabinet, with borrowings from one or two others. Senator "Pedro Hill Ramirez," whose assassination is ordered, is none other than Senator Juan Field Jurado, whose assassination in 1924 by the group of labor bravos known as "La Palanca" (the lever) took place exactly as Beals describes it. Only he calls the "Grupo Acción," the C. R. O. M.'s inner ring which controls its destinies, the "Group Machete." Beals's account of the gangsters reporting their murder to their labor chief is authentic primary historical material despite the changed nomenclature. He was an eye-and-ear witness.

Much superb writing, of which Beals is always capable, is offset somewhat by an occasional straining for effect, some over-writing, and a few adaptations as personal experience of the adventures of others. Thus Beals's thesis that "Mexican caricature begins with the landscape" and his description of the mountains in the northern deserts as "purple and ochre pimples that have burst the cutis of the fevered sands," is certainly far-fetched. To assert further "they are caricatures of mountains

. . . they are double-jointed, knock-kneed, pigeon-toed, hump-back mountains . . . rarely can one be at peace with the Mexican horizon. It provokes silent, nameless mirth," is a somewhat forced striving for a "lead" to his chapter on Mexican caricaturists.

But other passages are profound. Stuart Chase's thesis in his subsequently published "Mexico" is anticipated in Beals's illuminating chapter on "Milpa Alta," a village of the Federal District, not twenty miles from the capital, of which he says:
